

Policy Making Session 1

29 August 2017 10:45 - 12:15
Tampere Hall - Big Auditorium
Special Session
Higher Education

Educational Science and Policy-Making

Keywords: Educational policy, Higher education, Researcher education, Social aspects of learning and teaching

Interest group:

Chairperson: Hans Gruber, University of Regensburg, Germany

Organiser: Eero Ropo, University of Tampere, Finland

Education is one of the core issues of policy in every country. Policy provides the environment and the legal basis for the growth and development of educational systems, and educational science provides reliable arguments and solid evidence that may guide political decision-making processes. The interplay between policy and educational science requires considerable joint efforts to build a common understanding of the most prevalent educational problems and their solutions. Supranational organisations, both on a political level and on a scientific level, provide the adequate basis for an appropriate broad elaboration of those problems and solutions. In this EARLI panel, the following leading questions are discussed by outstanding representatives of policy-makers and educational scientists:- How is EARLI-based research perceived by policy? How relevant is the scientific quality of research for political decisions? Does current research meet the demands of policy-makers?

- What is the relevance of empirical evidence from a policy-making perspective? What guides the formation of opinion – with regard to educational evidence – of policy-making and administration?
- Are results of research about learning and instruction appropriately disseminated and communicated? Which formats of dissemination would be most appreciated by policy-making? Should educational science develop more initiatives to inform policy-making and administration? Does policy-making recognise and respond to opportunities for dialogue with educational science?
- Are national and European instruments of funding research adequate? Is there a need for more policy-driven research programs? How important is basic research in educational science?

School-to-school collaboration as a school improvement strategy

Keywords: Achievement, Educational policy, Quasi-experimental research, School effectiveness

Presenting Author: Daniel Muijs, University of Southampton, United Kingdom

Research is increasingly showing that, under the right circumstances, collaboration can be an effective way of developing and improving schools and their capacity. It is, however, not a panacea for school improvement, and other studies show a lack of effect. This therefore begs the question of not so much whether, but under what circumstances collaboration can be a successful school improvement model. In this paper we will explore two such models, with a particular emphasis on determining the extent to which they effectively lead to improvement in school (attainment) outcomes, and what factors are related to the success or failures of these models. Both programmes were evaluated using secondary data analysis of large-scale databases, and employed propensity score matching methods to create matched comparison samples, thus creating a quasi-experimental design. Results showed that intervention 1 was not related to improvement in school attainment outcomes over time, regardless of type of school. In intervention 2, however there was a significant relationship between participation in the intervention and improvement in attainment in the supported schools in both cohorts. The implications of these findings relate to the theoretical models described earlier in providing support to a more limited model of collaboration, linked to concepts prevalent in High Reliability theory, and social capital, and to a lesser extent, constructivist organizational models.

To lead school development towards inclusion - changes in school culture, norms and practice

Keywords: School effectiveness, Social aspects of learning and teaching, Teacher Professional Development, Workplace learning

Presenting Author: Magnus Erlandsson, Malmö University, Sweden

This paper elaborates on school leaders' strategies in efforts to change school culture and teachers' professional norms with the objective to alter educational practice. The point of departure is the opportunities and obstacles that emerged in a large-scale program (with over thirty participating schools in twelve different municipalities) launched for the implementation of inclusive learning environments. The paper has an organisation-cultural theoretical approach, focusing on how to change teachers' practices through the change of school culture and teachers' professional norms. Empirical data has been collected through several recurrent interviews with school principals, as well as coordinators and executives at the municipal-administrative levels. The results highlight the importance of a shared and delegated leadership between different levels and units. Successful implementation rests on the participation of many – school leaders, educators and pupils – and their possibilities to influence the processes and take joint responsibility. As the study shows, this is not developments or practices that can be forced, through binding rules or new formulations in policy documents. The change in professional norms – a prerequisite for changes in pedagogical practises enabling inclusion – must grow from below, using the impetus, inspiration and legitimacy from the levels of principals, but where changing norms and renewed practice should find its forms through a shared, delegated and collegial leadership.

Changing policy, legislation and its effects on pedagogical leadership: a comparative study

Keywords: Comparative studies, Culture, Educational policy, Qualitative methods

Presenting Author: Jiří Kropáč, Palacký University, Czech Republic; **Co-Author:** Stefan Chudy, Faculty of Education, Palacký University, Czech Republic; **Co-Author:** Danping Peng, Faculty of Education, Palacký University, Czech Republic

The relationship between school development and changing policy is in constant flux which adds to the complexity of school leadership. Based on investigation of the theories surrounding headteacher's pedagogical leadership, the main purpose of this study is thus to explore the quality of pedagogic leadership in schools providing compulsory education under current policies. A semi-structured interview was used on 10 headteachers, 5 are from Sichuan Province in China and 5 are from Olomouc region in Czech. Results show that the current educational policies in China and Czech are both supportive to the development of pedagogical leadership, and four dimensions of pedagogical leadership are significantly affected by changing policies. Despite that, the education policy implementation processes do not always support school development, there is a growing need to pay more attention to the effective and sustainable of the development of pedagogical leadership. *Keywords: Policy; school development; pedagogical leadership; policy implementation; comparative study*

Measuring Learning, Governing Education

Keywords: Educational Technology, Higher education, Learning analytics, Synergies between learning - teaching and research

Presenting Author: Asko Kauppinen, Malmö University, Sweden; **Presenting Author:** Anna Wärensby, Malmö University, Sweden

p.p1 {margin: 0.0px 0.0px 0.0px 0.0px; font: 11.0px Helvetica; -webkit-text-stroke: #000000} span.s1 {font-kerニング: none} In this paper we discuss the recent trend of measuring learning and its effects on shaping conceptions of education. We start by looking at the use of digital tools for teaching writing, and how these can be used to generate analytics to track evidence

for learning, development and the success or failure of educational interventions. We then look at how these analytics are used to launch, for example, evidence-based curriculum changes. We further connect this micro-level trend of measuring learning to a larger trend of using evidence-based models for governing educational pursuits. In fact, we suggest that measuring learning should not be seen as a separate educational phenomenon, but is indicative of a larger change in governance, where scientific methods are called for to evaluate inputs, and practices are shaped to provide data that qualifies as evidence for the success or failure of inputs. If practices do not produce acceptable measurements for evaluation, eventually, they have no right to exist.

Teacher who perceive low student engagement use for fear appeals prior to a high-stakes examination

Keywords: Emotion and affect, Mathematics, Teaching / instruction, Motivation and emotion

Presenting Author: Dave Putwain, Liverpool John Moores University, United Kingdom; **Co-Author:** Laura Nicholson, Edge Hill University, United Kingdom

Prior to high-stakes examinations teachers use messages that focus on the importance of avoiding failure (fear appeals). Previous studies have examined those factors that influence the appraisal of fear appeals and the educational outcomes. However, studies have yet to examine the possible reasons why teachers might use fear appeals. One possibility is that teachers believe their students are not engaged with their learning. The present study examined whether teacher use of fear appeals was related to their perceptions of student engagement, followed by students' interpretation of fear appeals, and how they related to student-reported engagement. Data were collected from 2061 students in their final two years of secondary schooling and 49 teachers response for mathematics instruction. A structural equation model showed that teachers used more frequent fear appeals in mathematics lessons when they perceived student engagement to be low. More frequent fear appeals resulted in stronger challenge and threat appraisals. A challenge appraisal was associated with greater, and a threat appraisal with lower, behavioural and emotional engagement. Indirect relationships were shown from teachers' perception of behavioural engagement to subsequent student-reported engagement mediated by fear appeals frequency and student appraisal. Student appraisal seems to determine the effectiveness of fear appeals. This makes them a risky strategy for teachers who may not be able to accurately determine which students might appraise them as a challenge.

The effects of generic and profession-specific teacher variables on instructional quality

Keywords: Pre-service teacher education, Teacher Effectiveness, Teacher Professional Development, Teaching / instruction

Presenting Author: Franziska Baier, Goethe-Universität Frankfurt, Germany; **Co-Author:** Anna-Theresia Decker, Goethe-University Frankfurt, Germany; **Co-Author:** Mareike Kunter, Goethe-Universität Frankfurt, Germany

There is still research lacking on the question of what traits, skills and qualifications teachers must bring to the job in order to provide their students with high quality instruction. Only few studies have investigated several cognitive as well as non-cognitive generic and profession-specific variables at the same time. In the present study we investigated general personal characteristics (personality and cognitive ability) as well as profession-specific aspect such as knowledge and job-related motivation of 209 mathematics teacher candidates. After 14 months of teaching experience 4,672 students of these teachers from grades 7 to 10 rated their instructional quality in terms of adaptive facilitation, emotional support, classroom management and discursive treatment of different student solutions. Multilevel structural equation modeling showed a positive effect of extraversion on adaptive facilitation, emotional support and discursive treatment of different student solutions. Conscientiousness had a positive effect on classroom management. Enthusiasm for teaching had positive effects on all measures of instructional quality but discursive treatment of student solutions. Teacher candidates' pedagogical knowledge had a positive effect on adaptive facilitation and emotional support whereas unexpectedly pedagogical content knowledge had a negative effect on adaptive facilitation. The results point to the importance of taking into consideration teacher candidates' non-cognitive characteristics such as personality traits as well as fostering teacher knowledge and motivation through high quality teacher education programs.

On the road to teachership: Student teachers' identity negotiations in the pedagogical studies

Keywords: Pre-service teacher education, Qualitative methods, Social aspects of learning and teaching, Teacher

Professional Development

Presenting Author: Maarit Arvaja, University of Jyväskylä, Finland; **Co-Author:** Anneli Sarja, University of Jyväskylä, Finland; **Co-Author:** Matti Taajamo, University of Jyväskylä, Finnish institute for educational research, Finland

This study, which is situated in the context of yearlong pedagogical studies for subject student teachers, explores how the students develop their professional identity in making sense of the pedagogical studies. We are interested in how the students negotiate the past, the present and the future in their 'becoming a teacher', and how the 'self' and 'others' are negotiated in the becoming teachers' identities. The group of five university students from different disciplines (biology, languages, mathematics and history) was selected as a focus group for the study. Data were gathered through semi-structured interviews briefly after the pedagogical studies had ended. Taking a dialogical approach to narrative self-construction the study investigated the relationship between different I-positions of the self and between the self and others in the student teachers' identity negotiation. Especially, this relationship was analysed with reference to the process of positioning as evidenced in the interviews. The study demonstrated how students' biographical history strongly contributed to their perceptions of future work, and played a pivotal role in building and renegotiating their identities as becoming teachers. The study also proved the importance of pedagogical studies in contributing not only in building one's I-positioning as a subject teacher but also in building one's identity as an educator. It can be said that the students found their 'authenticity' as a teacher leaning on values and purposes that transcends their own subjectivity and also (morally) relates to an inner commitment to certain values.

Teacher Students' and Mentors' Orientations – How Differences Influence Professionalization

Keywords: Developmental processes, Pre-service teacher education, Qualitative methods, Teacher Professional Development

Presenting Author: Julia Kosinar, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland;

Presenting Author: Emanuel Schmid, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:** Anna Laros, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

In a first step, the project "Challenges for future primary teachers in their field studies" (School of Teacher Education, Switzerland 2014-2017) pursues the goals to 1. analyse the process structure of professionalization during traineeship and 2. to identify types of professionalization. The study is using an occupational-biographical perspective and is based on the theory of experiential learning (Combe 2010) which allows tracing steps from perceived critical incidents through to their (eventual) solutions. The empirical data consists of narrative-style interviews with teacher students at the end of their three-years-study. 14 cases were reconstructed with the qualitative approach of the documentary method (Bohnsack 2010, Nohl 2013). The analyses were guided by three comparative dimensions and led to four different so called relational types, labelled as "Personal fulfilment", "Avoidance", "Development" and "Probation". In a second step, the relation between the student's orientations concerning their field experiences (taking it e.g. as an option for their professional development or as an examination period) and the role they attribute their mentors (e.g. as supporters, assessors or experts) was further analysed. The results show that different meanings given to the mentor's role by teacher trainees and their school-mentors, may lead to tensions. If tensions occurred, processes of professionalization were hindered. In our contribution, we present our typology as well as two case studies to give further insights in specific dynamics.

Impact of Professional Development on Teacher Facilitation of Science Discourse: a case study

Keywords: Argumentation, Case studies, Science education, Teacher Professional Development

Presenting Author: Emily Reigh, Stanford University, United States; **Co-Author:** Florencia Gomez Zaccarelli, Stanford University, United States; **Co-Author:** Hilda Borko, Stanford University, United States; **Co-Author:** Jonathan Osborne, Stanford University, United States

Despite the extensive knowledge base on effective teacher professional development (TPD), the field lacks an adequate understanding of how teachers implement knowledge from TPD experiences. This paper presents a case study of four teachers who participated in a TPD program focused on supporting classroom discourse and argumentation in elementary science. In order to understand changes in teacher practice after the TPD, three years of classroom videos were analyzed for *talk formats*, *activities*, and *moves* that facilitate productive science discussions. All teachers adopted key practices from

the TPD on the three parameters of analysis. However, their styles of implementation were markedly different. Overall patterns across the four cases, as well as two contrasting cases and the affordances of each will be presented. As teachers shifted to student-centered discussions, they struggled to negotiate their new role; the initial reaction for some was to step out of the discussion. Analysis of teacher moves shows their eventual adoption of a wide range of strategies that allowed them to actively facilitate the discussion without impeding student contributions. Both teachers in the contrasting cases implemented practices introduced by TPD, although one of them also combined invitations with support and brought discussions to resolution. This paper offers strategies for engaging students in scientific argumentation, a major focus of the Next Generation Science Standards, and provides evidence of how teachers take up new practices, which will inform TPD developers and providers.

MacGyver and Mother Teresa in one: Teachers' job satisfaction, conceptions of learning and role

Keywords: Qualitative methods, Quantitative methods, Teacher Professional Development, Teaching approaches

Presenting Author:Katrin Poom-Valickis, Tallinn University, Estonia; **Co-Author:**Erika Löfström, University of Helsinki, Finland; **Co-Author:**Kirsti Kislenko, Tallinn University, Estonia; **Co-Author:**Tuuli Oder, Tallinn University, Estonia

Teachers' beliefs about their role is an important component of teacher identity. Teacher identity is based on core beliefs about teaching and is an ongoing process of interpretation and re-interpretation of experience (Beijaard et al., 2000). 658 Estonian lower secondary school subject and class teachers provided metaphors that characterizes teacher's role. Additionally, the teachers were asked to reply to questions about job satisfaction and conceptions of learning. The majority of teachers' metaphors were identified to be hybrids, which shows that teachers have complex understanding about their role. Differences were found between the teacher groups participating in the study. The analysis of affective connotations of the metaphors showed that there are approximately one third of the teachers who were not satisfied either with their role or work conditions. This could be an indicator of reduced well-being. The affective connotations reflected teachers' job satisfaction. Statistically significant differences emerged between the positive and negative affective groups in terms of satisfaction with job conditions and job enjoyment. There was no significant difference among teachers based on metaphor analysis and their general beliefs (constructivist, traditional) about teaching.

The effect of school-based experience on preservice teachers' self-efficacy beliefs

Keywords: Educational Psychology, Pre-service teacher education, Quantitative methods, Self-efficacy

Presenting Author:David Berg, University of Otago, New Zealand; **Presenting Author:**Lisa F. Smith, University of Otago, New Zealand

This research examined preservice teachers' self-efficacy beliefs, immediately prior to and after the final practicum of an undergraduate three-year initial teacher education programme. The primary purpose of the study was to explore the effect of practicum on the students' teacher self-efficacy beliefs. A secondary objective was to compare the utility of two established measures of teacher self-efficacy. Teacher self-efficacy beliefs are teachers' beliefs about their capacity to carry out their professional roles successfully. These beliefs are of interest to teacher educators, as they have been shown to relate to significant outcomes for students, schools, and teachers (Tschannen-Moran, Hoy, & Hoy, 1998). A body of research has examined the impact of teacher self-efficacy beliefs; however, less attention has been given to the antecedents of such beliefs (Labone, 2004; Pfitzner-Eden, 2016; Tschannen-Moran & Woolfolk Hoy, 2007). Considering possible antecedents, it seems probable that during a practicum experience, preservice teachers have considerable engagement with Bandura's (1997) four sources of self-efficacy beliefs: mastery experience, vicarious experience, verbal persuasion, and physiological and affective states, and that these may contribute to preservice teachers' self-efficacy beliefs. In this study, preservice teachers from New Zealand ($n = 39$) completed the Teachers' Sense of Efficacy (long form) (Tschannen-Moran & Woolfolk Hoy, 2001) and the English version of the Norwegian Teacher's Self Efficacy Scale (Skaalvik & Skaalvik, 2009), before and after their final practicum placements. Results indicated that the participants' self-efficacy beliefs increased from pre to post. These results are discussed along with a comparison of the two measures.

Learning climate and conflicts in teacher education practice

Keywords: Pre-service teacher education, Quantitative methods, Social interaction, Student learning

Presenting Author:Johan Kristian Andreassen, University of Agder, Norway; **Co-Author:**Rune Høigaard, Department of Public Health, Sport and Nutrition, Norway

Cooperating teachers play a central role in the training of new teachers, and greatly affect how student teachers develop a repertoire of teaching strategies and their understanding of professional practice. This study aims to investigate student teachers' perception of mentoring during their teaching practice with an emphasis on; a) how cooperating teachers manage to facilitate an autonomy supportive learning climate; b) aspects of the interaction between cooperating teachers and student teachers and; c) conflicts in the relationship between cooperating teachers and student teachers. The participants in this study were 200 third and fourth year student teachers in primary teacher education from one university in Norway. The average age of participants was 23.8 years ($SD = 3.9$) and the response rate was 61 %. We find that student teachers experience of mentoring are characterised by major differences regarding the experience of an autonomy-supportive learning climate. We also find that conflicts are a common cause of problems in the interaction between cooperating teachers and student teachers, in particular with regard to relational conflicts.

Session A 4

29 August 2017 13:15 - 14:45

Main Building D - D14

Symposium

Instructional Design, Learning and Social Interaction, Teaching and Teacher Education

Exploring the Adoption and Sustainability of an Informal STEM Education Innovation

Keywords: Case studies, Communities of learners, Design based research, Ethnography, Informal learning, Instructional design, Peer interaction, Qualitative methods, Quantitative methods, Social interaction, Student learning, Teacher Professional Development, Teaching / instruction

Interest group: SIG 10 - Social Interaction in Learning and Instruction

Chairperson: Kristiina Kumpulainen, University of Helsinki, Finland

Discussant: Thomas Hillman, University of Gothenburg, Sweden

This symposium brings together four different perspectives on the adoption and sustainability of FUSE Studios, an alternative STEAM learning infrastructure. Since its launch, FUSE has been adapted successfully in 149 different implementations operating across five different states and three different countries (USA, Finland, and Israel). Yet, despite being adapted to each local context, FUSE has managed to preserve its coherence and integrity as an educational innovation. Therefore, an analysis of the dual processes of adoption and adaptation in FUSE implementations could thus offer significant insights into the dilemma of the integrity and sustainability of educational design (e.g., Hubbard, Mehan, & Stein, 2006).

While the idea of designing for adaptability is increasingly recognized as important (e.g., Penuell, 2011), the research literature is still thin on how this adaptability works in practice. Each of the contributions explore the adaptability of FUSE with data from implementations of FUSE from the US and Finland. Together the contributions argue for the integrity (rather than fidelity) of implementation (LeMahieu, 2011).

Adaptation begets adoption: How an educational innovation became part of the regular school day

Presenting Author: Reed Stevens, Northwestern University, United States; **Co-Author:** Jaakko Hilppö, University of Helsinki, Finland; **Co-Author:** Kemi Jona, Northeastern University, United States

This paper presents an analysis of the first phases of adoption of FUSE, an innovative educational program. The paper conceptualizes this adoption process from an actor network theory (ANT, e.g., Latour, 2005) perspective which calls attention to its socio-material. More specifically, the research question our case study addresses is how a new actant (i.e. the FUSE Studio) was incorporated into a standing and relatively stable actor-network (i.e. the traditional public school day)? By analyzing open-ended interviews (Patton, 2002) conducted with key personnel working on both sides of the FUSE research-practice (the designers of FUSE and the district adopting it), the findings highlight *mutual appropriation* (e.g., Downing-Wilson, Lecusay, & Cole, 2011) taking place during the adoption and spread of FUSE as well as the surprising importance of 3D objects printed by the students and their circulation. In all, the paper contributes to understandings of how educational innovations, as actants, spread and become stable actors in different networks.

Organizing for interest discovery and peer support in a free-choice environment

Presenting Author: Daniela DiGiacomo, University of Colorado at Boulder, United States; **Co-Author:** William Penuel, University of Colorado Boulder, United States; **Co-Author:** Katie Van Horne, University of Colorado Boulder, United States

Designed by learning scientists, FUSE Studios is an interest-driven learning experience that is offered to in and out-of-school educational settings throughout the United States and abroad. Offering young people a chance to engage in on- and off-line STEAM-related “challenge” sequences, FUSE is a free-choice learning environment that has been widely lauded by teachers and educators since its inception in 2014, in particular for its ability to engage and sustain students’ interest and participation. In this paper, we make use of two years of evaluation data to analyze youth experiences and outcomes of FUSE as related to their patterns of participation. Employing the framework of Connected Learning to make sense of the results, we find that 1) FUSE Studios promoted a high degree of support for youth interest-discovery and peer-support, regardless of mode of participation; and 2) positive attitudes toward science and engineering were predicted by high reported experiences of interest-discovery. We discuss these findings in an attempt to offer implications for those interested in designing learning environments that are open-ended, rigorous, and have the potential to strengthen current and future attitudes toward STEAM-related fields.

How do teachers make sense of a new infrastructure for learning?

Presenting Author: Kristiina Kumpulainen, University of Helsinki, Finland; **Co-Author:** Antti Rajala, University of Helsinki,

Finland; **Co-Author:**Anna Mikkola, University of Helsinki, Finland

In this paper, we investigate how Finnish teachers make sense of a new FUSE Studio infrastructure for learning. Infrastructure for learning refers to socio-materially mediated arrangements on which the school activity relies (Stevens, et al., 2016). Finnish schools represent an interesting site for researching the uptake of FUSE due to the unique nature of Finnish educational policy that centers on teachers' autonomy (Sahlberg, 2011; Simola, 2015). Our study asks; How do Finnish teachers make sense of the FUSE infrastructure for learning? Which possibilities and tensions do teachers identify in the uptake of FUSE in their schools? Informed by cultural-historical theorizing our study stresses teachers' agency in educational reforms. This involves regarding teachers as valued participants in co-configuring educational reforms to address local needs. The empirical data derive from two public schools situated in culturally and socioeconomically heterogeneous suburbs of Helsinki. The data comprise 23 teachers' and four principals' accounts derived from semi-structured interviews conducted after a two-day in-service FUSE training program. The interviews were analysed using qualitative content analysis and thematic analysis (Kvale & Brinkmann 2009). The analysis revealed critical themes unpacking the teachers' sensemaking of FUSE. Namely, 1) FUSE as a possibility 2) FUSE as a tension, 3) FUSE within the operating culture and leadership of the school, and 4) FUSE and teacher agency and empowerment. In conclusion, the study highlights the complexity involved in the task of reforming school instruction and suggests that reforms can only succeed by involving the teachers as contributors to the process.

Productive deviations: students' agency and adaptations of FUSE

Presenting Author:Reed Stevens, Northwestern University, United States; **Co-Author:**Jaakko Hilppö, University of Helsinki, Finland

This study focuses on analyzing the adaptations students make to an innovative educational program when it is implemented as part of their regular school day. More specifically, the study highlights how these adaptations are managed locally by the teachers and the students and the learning that ensues from them. Building on socio-cultural and activity theory perspectives (e.g., Engeström, 2009; Rajala, 2016), the study conceptualizes these adaptations as *productive deviations*, and argues that they represent pivotal cases for understanding the management of the tension between the students agency the pedagogical design of the learning environment. The data for the study comes from an ethnographic data corpus of seven different FUSE Studios during 2014-2015 in a large midwestern school district in the United States. The conducted interactional analysis (e.g., Jordan & Henderson, 1995) has shown the deviations were sparked by the challenges offered by FUSE, but importantly extended and expanded them in unexpected ways. More specifically, the deviations were centered around the creation of new artifacts, like computer games or emoji pillows and this creation process required solving relatively complex design or production problems on part of the students and not present in the challenges. Furthermore, in order to solve these kind of problems, the students brought new tools and resources to FUSE step-by-step learned to use them. In all, the study contributes to current investigations into the connection between agency and learning in formal educational settings (e.g., Siry et. al, 2016; Rajala, 2016)

Session A 5

29 August 2017 13:15 - 14:45

Linna - K103

Symposium

Culture, Morality, Religion and Education

Morality is not enough – Dimensions and factors contributing to teacher ethos

Keywords: Morality, Social development, Teacher Professional Development, Values education

Interest group: SIG 13 - Moral and Democratic Education

Chairperson: Karin Heinrichs, Otto-Friedrich-University Bamberg, Germany

Discussant: Dimitris Pnevmatikos, University of Western Macedonia , Greece

Teachers' ethos often is connected with the moral person. But it has not been discussed that a so called immoral person can have deep and highly efficient professional ethos as f. i. having the will that all children in a class learn, doing a just grading or being involved for handicapped youngsters. In most models the moral person is necessary to define ethos but not a sufficient condition for teacher ethos. In this symposium we analyze how the morality of a person (stage development, moral feelings, sense of necessity, relatedness to virtues, but also moral knowledge, moral pedagogical content knowledge, moral motivation etc.) are connected to professional ethos of teachers. Considering the classical models of ethos it can be conceptualized as a) ethos as attitude, sensibility, responsibility, professional virtue, communicative competence (Gardner, 2007; Tirri, 2008; Campbell, 2007; Heinrichs, 2015), b) ethos as concern, commitment and caring behavior (Noddings, 1992; Veugelers, 2011; Nucci, 2001) , c) ethos as professional or moral identity (Krettenauer, 2015; Lapsley, 2014, Edelstein et al., 1993), d) ethos as a "procedural" competence (Oser, 1998; Heinzer, 2013), and e) ethos as an empirical moral and value judgment (Beck, 2015; Harder, 2015; Bauer, 2013; Coklar, 2012). We can hypothesize that at least b) and c) are mostly overlapping personal morality with ethos. The symposium thus takes place at the frontline of the modeling process of a very important professional competence. Morality of a person is not enough for teachers' ethos. Teacher ethos is rather a situation specific concept.

To be moral is not enough – Relatedness of moral personality to the professional ethos

Presenting Author:Fritz Oser, University of Fribourg, Switzerland

In this more theoretical paper we would like to outline why concepts like moral identity or moral self or moral personality, even moral models, do not predict the moral ethos of a teacher. The seeing in the opposite direction mirrors the same problem, namely, high ethos values do not predict a perfect moral personality. This refers of course to all models that presume that a person with high moral identity (Blasi, 1984; Krettenauer, 2015) does not necessarily see the needs and the weaknesses and the learning deficits etc. of a child in which ethos is at stake and which is a necessary condition for having a teaching ethos. In addition to this we begin to see that the moral reaction to a human problem is highly domain and situation related (see Beck 2003).

Empathy – a core concept of teacher ethos, but not enough?

Presenting Author:Karin Heinrichs, Otto-Friedrich-University Bamberg, Germany; **Co-Author:**Simone Ziegler, Otto-Friedrich-University Bamberg, Germany; **Co-Author:**Julia Isabella Warwas, University of Bamberg, Germany

Harder (2015) or Noddings (1992) consider teacher ethos as a set of values teachers committed to in order to act as a professional, in particular to care for their students and a social climate in classes. Thus, teacher ethos is relevant not only in moral dilemmas, but maybe also effect moral acting in situations of less moral intensity. Studies on patterns of moral decision-making in adulthood, in particular on the happy victimizer pattern (HVP) pointed out that people who decide for breaking a moral rule sometimes feel happy if they could take advantage for themselves. Thus, their social orientation sometimes is limited by their own preferences. This paper presents a study on patterns of moral decision-making among students (economics, business and vocational education as well as students who aim to become teachers). The participants were confronted with moral conflicts. We found that students who liked to become teachers show higher empathy and social orientation than students of economics. However, also among future teachers the HVP emerged. That means that even (future) teachers are sometimes not following their social orientation and care for others. Moreover, they sometimes also care for their own needs. Finally, we would try to conceptualize teacher ethos by referring to Rosenberg's model of non-violent communication. We argue that teacher ethos in a sense of getting into appreciating relationships has to go beyond caring for others but calls for balancing students' as well as teachers' needs.

Teacher ethos: A stable moral personality trait or a situation-specific competence?

Presenting Author:Alfred Weinberger, Pädagogische Hochschule der Diözese Linz, Austria

This study scrutinizes two widespread assumptions regarding teacher ethos. The first assumption refers to the view that teacher ethos is a stable personality trait. The second assumption relates to the view that teacher ethos corresponds to the morality of the teacher. The first assumption can be challenged by referring to the theory of situation specificity TSS (Patry, 1991) which posits that any social behavior is situation specific. The second assumption can be challenged by clarifying the question how teacher ethos is defined. Oser et al. (1991) define teacher ethos as the competence to solve an interpersonal conflict discursively. It is hypothesized that a) pre-service teachers discourse orientation is situation specific and b) there is no correlation between the discourse orientation and the stage of moral judgment. 940 critical incidents of 94 pre-service teachers were content analyzed with respect to the types of interpersonal conflicts and the discourse-orientation. The Moral Competence Test MCT assessed moral judgment competence. The results indicate a significant situation-effect revealing that pre-service teachers show different discourse-orientation in different situations. A correlation analysis with the variables "discourse-orientation" and "moral judgment competence" yields a zero-correlation revealing that there is no link between ethos and morality. Implications for teacher education are discussed. Oser, F. et al. (1991). *Der Prozess der Verantwortung. Berufsethische Entscheidungen von Lehrerinnen und Lehrern*. Freiburg/CH: Pädagogisches Institut der Universität. Patry, J.-L. (1991). *Transssituationale Konsistenz des Verhaltens und Handelns in der Erziehung*. Bern: Lang.

Does teachers' ethos need morality?

Presenting Author:Brigitte Latzko, University of Leipzig, Germany; **Co-Author:**Eveline Gutzwiller-Helfenfinger, University of Teacher Education of Lucerne, Switzerland; **Co-Author:**Anne-Cathrin Paeßler, University Leipzig, Germany; **Co-Author:**Katrin Gottlebe, University Leipzig, Germany

According to the current research teachers' ethos is mainly conceptualized along moral dimension (e.g. Klaassen, 2002; Tirri, 1999). This is not surprising - even from a linguistic point of view - as ethos and morality are often used synonymously. Dominating approaches towards the concept of teacher ethos within teacher education reflect this understanding (e.g. Weinberger, 2014). This presentation aims at analyzing this phenomenon, namely the strong interrelation of professional ethos and morality, in order to question the same. By referring to selected empirical data on diagnostic skills as key competencies of teachers' professionalism (Zlatkin-Troitschanskaia, Beck, Sembill, Nickolaus & Mulder, 2009) we argue that we need to consider more than moral dimensions to capture teachers' professional ethos.

Session A 6

29 August 2017 13:15 - 14:45

Pinni B - B4115

Symposium

Culture, Morality, Religion and Education, Educational Policy and Systems, Lifelong Learning, Teaching and Teacher Education

Forging forward in and through the arts through education

Keywords: Arts, Case studies, Communities of practice, Culture, Educational policy, Knowledge creation, Literacy, Out-of-school learning, Qualitative methods, Reflection

Interest group: SIG 04 - Higher Education, SIG 11 - Teaching and Teacher Education, SIG 13 - Moral and Democratic Education, SIG 25 - Educational Theory

Chairperson: Georgina Barton, University of Southern Queensland, Australia

Discussant: Viviana Sappa, Swiss Federal Institute for Vocational Education and Training, Switzerland

The significance and impact of the arts on and in education has been well documented globally (Bamford, 2006; Pascoe, et. al., 2005). Despite this importance there continues to be a disjuncture between priorities in education policy and these benefits. The marginalisation of the arts in education appears to be linked to the increasing rise of standardised tests to measure student achievement in a performance based educational climate (Baguley & Fullarton, 2013; Barton et al., 2013; Ewing, 2010). Despite these observations a rich diversity of arts education practices exists across the globe. This symposium aims to explore the UNESCO Roadmap for Arts Education (2006) the tenets of which underpin the World Alliance for Arts Education (WAAE) via research, networking and advocacy. The Road Map's key aims are, to: 1. uphold the human right to education and cultural participation, 2. develop individual capabilities, 3. improve the quality of education and 4. promote the expression of cultural diversity. After an initial introduction to the key concepts and a reflection activity, four presentations will follow based on the aims above. The symposium will conclude with an open forum led by Associate Professor Ralph Buck (Chair of the WAAE) as the discussant, and featuring a panel of arts education experts, on the future of arts education practice and research.

The place of the arts in curriculum and schooling: Improving the quality of education

Presenting Author:Georgina Barton, University of Southern Queensland, Australia; **Co-Author:**Robyn Ewing, University of Sydney, Australia

Recent research demonstrates that the provision of arts education, particularly in developed countries, is at an all-time low. Reasons attributed to this decrease include increasing pressure on teachers and schools to improve results in high stakes testing such as the Scholastic Aptitude Test (SAT) in the United States, Pan-Canadian Assessment Program (PCAP) and the National Assessment Program: Literacy and Numeracy (NAPLAN) in Australia. Most of these focus on the testing of a narrow range of literacy (and numeracy) skills. Despite this perceived view of limited access to arts education increasing research over the last fifteen years documents the benefits of embedding quality arts experiences and processes in children's literacy education and across the curriculum more generally. This paper therefore addresses the tense relationship between the arts and literacy by illustrating how the association between the two can be dynamic, rewarding and is flourishing in some in- and out- of -school contexts. We begin by acknowledging a more inclusive definition of literacy as "interpretive and expressive fluency through symbolic form, whether aural/sonic, embodied, textual, visual, written or a combination of these within context" (Barton, 2014, p. 3). We demonstrate how the key aims of the UNESCO Road Map for Arts Education can be realised by highlighting the unique literate practices that underpin effective arts education programs and creative teaching and learning in schools. Finally, several contemporary examples of transformative arts and literacy learning and teaching will be shared.

Art and Soul: Upholding the human right to education and cultural participation

Presenting Author:Martin Kerby, University of Southern Queensland, Australia; **Co-Author:**Margaret Baguley, University of Southern Queensland, Australia

A number of international declarations and conventions that aim at securing for every child and adult the right to education including The Universal Declaration of Human Rights (1948) and the Convention on the Rights of the Child (1990) exist. In 2006 UNESCO identified the critical importance of arts education through their Road Map for Arts Education (2006). The importance of the arts in fostering a sense of community and cultural citizenship was a finding in Bamford's (2006) global study on the impact of the arts in education. She found that "quality arts education within schools can lead to social, economic and educational improvements within communities" (Bamford, 2006, p. 122). The involvement of the community has been a particular focus of the Australian Government's approach to the Centenary Commemoration of World War 1. The 'spirit of Anzac' is now widely regarded as the "linchpin of Australian national identity" (Deane, 2002 cited in Fischer, 2012, p. 222). Its capacity to generate an "all-inclusive experience of Australian multicultural togetherness" (Fischer, 2012, p. 226) where once it had been the jealously guarded domain of the white Anglo Saxon male is indicative of the malleability that in part explains its enduring fascination (Seal, 2011). This presentation describes two arts-based projects in Australia secured under the Queensland ANZAC Centenary Grant and the Australian Government's Arts and Culture Fund – Public Program grant. Both projects were the result of cross institutional collaborations that drew on individuals with a range of expertise from a variety of fields without an explicit connection to either the military or historical commemoration.

Arts-based research, wellbeing and A/r/tography: Developing individual capabilities

Presenting Author:Susanne Garvis, University of Gothenburg, Australia; **Co-Author:**Abbey MacDonald, University of Tasmania, Australia

Arts-based research with young children provides new ways to understand children's lives and perspectives. Arts-based research can be seen as a method within qualitative research study (Cole & Knowles, 2008). In recent years, there has

been growth in the use of arts-based research tools in a number of disciplines, all seeking ways for children to participate and share their understanding of their world. This chapter provides a snapshot of current arts-based research tools with young children (aged birth to five years) in two disciplines; health and education. The chapter concludes with a reflection about visual methods and a call for researchers to also think about the engagement of other arts-based research tools that could be implemented with the youngest of children. Similarly, A/r/tography is a method by which artists/teachers/researchers can use art as research method. A/r/tography continually asks questions in an effort to engage with ongoing practices in art and education in order to create knowledge rather than discover it. In so doing, it is only resolved retrospectively as new understandings are shared upon reflection on practice (LeBlanc et. al., 2015). Six individuals representing six continents share their experiences as university professors teaching undergraduate and graduate classes or supervising graduate students completing a/r/tographic dissertations, or as PhD graduates who used a/r/tography as the methodology in their theses or dissertations.

Arts, language, training, education, learning (AlféA)

Presenting Author: Martin Kerby, University of Southern Queensland, Australia; **Co-Author:** Jean-Charles Chabanne, ENS de Lyon, France

Finding the optimal way to integrate the arts and education [AE] is a universal concern. The OECD describes how AE fosters “skills that fuel innovation in the economy and society: creativity, imagination, communication and teamwork to name a few”. AE’s unique contributions to skills considered ‘fundamental’, argue for giving them their rightful place: AE calls upon technical skills, including the broad conception of literacy known as multiliteracy in the 21st century. AE is also inseparable from a cultural education which should provide as many opportunities as possible to encounter, experiment, analyse, discuss, appreciate or criticise as large a range of artworks as possible and through this process to create one’s own personal collection of arts experiences and documented knowledge. This paper aims at presenting the AlféaRT project, a research network supported by a research initiative of the University of Lyon and the French national science agency. AlféaRT means Arts, languages, formation, éducation, apprentissages: recherche et transfert (Arts, language, training, education, learning: research and transfer) and has two related objectives. The first consists of identifying and understanding the inseparable theoretical and practical issues encountered by teachers who seek to give arts education and education through the arts their rightful place. This research project used methods of field observations, video elicitations and interviews. The second objective, linked to the first, was to design a multi-user multimedia resource that can be used for research and teacher education purposes, based on the needs formulated in real settings by the stakeholders.

Symposium

Culture, Morality, Religion and Education

Acculturation and Adjustment of Minority Youth: Individual, Family, and School Related Factors

Keywords: Achievement, At-risk students, Content analysis, Cultural diversity in school, Developmental processes, Language (Foreign and second), Mixed-method research, Parental involvement in learning, Quantitative methods

Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings

Chairperson: Elena Makarova, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

Discussant: Kerstin Göbel, University of Duisburg-Essen, Germany

The process minority youth undergo while adjusting to the mainstream culture is known as acculturation. Research on acculturation distinguishes between acculturation strategies (integration, assimilation, separation/segregation, marginalisation), acculturation outcomes, and conditions of acculturation. Acculturation outcomes in the school context can be measured in terms of students’ psychological well-being and their academic performance. For minority youth, family and school are the two main contexts of acculturation. The aim of the symposium is to discuss trajectories of minority students’ acculturation in terms of family and school related characteristics that are influential for youths’ adjustment. Based on a longitudinal study, the first paper shows that acculturation change is a variable process and its patterns are differently related to family relations and adolescent school adjustment. Applying an integrative review of research on acculturation, the second paper illustrates various ways in which parents’ expectations, attitudes or behaviours can support or hamper minority youths’ school adjustment. The third paper presents a study on minority parents’ educational expectations, support for their children and coping strategies with their children’s difficulties in education. The fourth paper demonstrates that school related variables play a significant role in immigrant students’ achievements, not only in a second language but also in a third language. Furthermore, youths’ acculturation and academic experiences are intertwined with issues of language, identity, and cultural belonging. Overall, the symposium provides multifaceted insights into challenges minority students encounter during the acculturation process, and illustrates the interplay between individual family and school related factors of minority youths’ adjustment

Person-Centered Trajectories of Cultural Behaviors and Values among Chinese American Adolescents

Presenting Author: Linda Juang, University of Potsdam, Germany; **Co-Author:** Moin Syed, University of Minnesota, United States

For children of immigrant background, acculturation is a key construct for understanding psychological, social, and educational adjustment. Our longitudinal study examines the stability and change patterns of acculturation among Chinese American adolescents. We tested whether these patterns are related to key demographic variables as well as family cohesion, self-esteem, general and academic self-efficacy, and GPA. The sample included 316 9th and 10th grade Chinese American adolescents assessed three times over two years. Defining our cohorts as year in school, we analyzed our data as an accelerated longitudinal design covering four time points. We used joint trajectory mixture modeling to assess group-based patterns of change in U.S. and Chinese behaviors and values. The analyses suggested a six-class solution for values and a six-class solution for behaviors. The results show that acculturation value patterns were not related to gender, nativity, or parent education. Acculturation value patterns were, however, related to family cohesion, self-esteem, general and academic self-efficacy, and GPA. The results show that acculturation behavior patterns were not related to gender but were related to nativity and parent education. Acculturation behavior patterns were also related to general self-efficacy and family cohesion, but not self-esteem, academic self-efficacy, or GPA. Findings suggest that acculturation change is a slow process, it is quite variable, and patterns of trajectories relate differently to family relations and adolescent school adjustment.

Family Related Factors for Minority Youths' Acculturation and Their School Adjustment

Presenting Author:Elena Makarova, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Judith 't Gilde, University of Vienna, Austria; **Co-Author:**Dina Birman, University of Miami, United States

An important process underlying the adjustment of ethnic minority youth in the country of settlement is acculturation. The ecological approach to acculturation research suggests that the relationship between acculturation and adjustment is shaped by the surrounding context. The family context has been recognised as crucial in the acculturation of young people from ethnic minority backgrounds. Research on acculturation has shown that intergenerational discrepancies in immigrant families can impact minority youths' adjustment in various ways. This study systematizes the findings of empirical research on minority youth acculturation, focussing on the influence of family-related factors in minority youths' psychological adjustment and their academic achievement. A total of 348 peer-reviewed articles were selected and analysed for content, using a deductively developed and inductively enriched system of categories. Overall, the content analysis of the target categories indicates various ways in which parents' expectations, attitudes or behaviours can support or hamper minority youths' school adjustment. Our results also show that young people's school adjustment is often embedded in an acculturation dilemma shaped by the discrepancy of youths' attitudes and expectations and those of their parents. Finally, our findings indicate a number of factors that can bridge an acculturation gap between family and school context.

Parental Coping Efforts on Successful Education of Minority Youth: The "Tanoda" Schools in Hungary

Presenting Author:Janos Gyori, Eötvös Loránd University, Hungary

Since the mid 1990s a chain of extracurricular afterschools – so called 'Tanoda'-s – are functioning in Hungary, which are maintained by different NGO-s and offer non-formal remedial and/or enrichment education for students who come from disadvantaged – in a big number from Roma – families. In our research on Tanoda-s we mainly focused on the students' and their families' social background and their strategies to cope with educational difficulties. As a part of our research, we carried out in-depth interviews with 14 parents from three Tanoda-s, on their educational expectations, support for their children and coping strategies with their children's difficulties in education. It was found that parents display much devotion to their children's educational success and would wish to find the most promising paths for the best possible educational carrier for them. However, while they have warm, supportive parental attitudes with high expectations in education, they are not ready to support their children's full independence to pursue these goals, they are overprotective and restrictive with their children because of their different social anxieties and fears, and because of some sorts of short term family needs and goals. In case of Roma students in Tanoda-s it means that parents from ethnic minority groups hold a somewhat controversial attitude towards their children's acculturation into the majority's system of education.

Role of School in Immigrant Students' Literacy Performance and Acculturation into the New Society

Presenting Author:Orly Haim, Beit Berl College, Israel, Israel

This study investigates the role that school related variables play in literacy performance in second and third language among immigrant youth. Additionally, the study explores the students' perspectives regarding their educational experiences. The sample includes 267 Russian speaking eleventh graders drawn from 18 Israeli high schools. Data about the schools were collected through structured interviews with the school principals. Students' perceived school experiences were elicited via academic letter writing tasks. A total of 180 letters (60 letters in each language: Russian, Hebrew and English) drawn from the entire data set are analyzed qualitatively through content analysis. This study utilizes a mixed method approach. Multivariate analysis of covariance, controlling for students' SES, arrival age and gender, indicate that students' academic performance in Hebrew and English differs by a number of school related factors: school type, school SES, provision of academic and language support, and teachers' training to work with immigrant students. Qualitative analyses of students' letters reveal a number of major themes in the data including: language inequality and power struggle, academic difficulties, unequal social and cultural relations, and issues of identity (i.e., the 'self'- and the 'other'). These results highlight the role of the particular learning environment and socio-linguistic context as sources of variation in both L2 and L3 performance among immigrant learners besides individual learner characteristics. Additionally, the findings point to the significant role of the immigration experience in explaining the perceived educational experiences and

acculturation processes among immigrant youth.

Session A 8

29 August 2017 13:15 - 14:45

Main Building A - A32

Symposium

Assessment and Evaluation

The use of rubrics for feedback and learning – new insights from research

Keywords: Assessment methods and tools, Attitudes and beliefs, Mathematics, Multimedia learning, Peer interaction, Science education, Self-regulation, Student learning, Teaching approaches

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Robbert Smit, University of Teacher Education St.Gallen, Switzerland

Discussant: Anders Jonsson, Kristianstad University, Sweden

The role of feedback is essential for learning. It is most powerful when given in an elaborated form to help the learner change erroneous knowledge components and, thus, improve achievement. Rubrics are assessment tools that provide such beneficial information to the learner. This symposium presents four papers studying 'rubrics' as an instrument for formative assessment in different levels of education. The first two papers focus on the use of rubrics in higher education. While presentation one looks at the benefits of peer-assessment with the help of rubrics, presentation two investigates how the involvement of students in the construction of a rubric fosters their competence for self-regulation. The other two presentations are based in elementary education. In study three it is observed how the rubric serves as a tool for clarifying the learning aims at different stages of the instruction phase, e.g., before, during, and after the learning sequence. The fourth study looks at the effects of a rubric for mathematical reasoning on students' self-efficacy beliefs and student achievement. The discussion by Anders Jönsson will address common themes in the four papers and critical suggestions, aimed at deepening our understanding and advancing the research on the use of rubrics for learning.

Peer-assessors' heuristics and peer-feedback produced in peer assessment with the use of rubrics

Presenting Author:Olia Tsivitanidou, University of Cyprus, Cyprus; **Co-Author:**Costas Constantinou, University of Cyprus, Cyprus

In this study, we sought to examine undergraduate student teachers heuristics in the peer-assessor role when offering feedback to peers in a science course with the use of rubrics. We also aimed to examine whether the strategies that we were able to identify associate with students' initial background knowledge and the type of feedback that they produce. Participants were 24 undergraduate student teachers in Primary Education from a university in Cyprus, who were studying a web-based unit on marine Ecosystems. By the end of the teaching unit, students reciprocally and individually assessed the web-portfolio of a peer-group, with the assistance of 3-point Likert scale rubric with pre-defined criteria. Their actions on their screens were recorded during the enactment of the peer-assessor role with the use of the RiverPast Software Pro. Data were collected from four sources: pre-instructional tests, screen-video captured data, peer-feedback data and post-instructional interviews with students. Data were exposed to qualitative analysis and then also treated quantitatively through the use of non-parametric tests. Findings revealed two main assessor profiles. In particular, assessors were distinguished into *autonomous* (profile 1) and *informed* (profile 2). Overall, students' initial performance was not associated with their actions on the peer-assessor role. Assessors' profiles had statistically significant differences in the explicit guidance offered as part of the feedback produced; informed assessors offered more guidance compared to the guidance offered by autonomous assessors. The findings have implications for teaching practice as well as policy for teaching and learning in web-based learning environments.

The effect of co-created rubrics on self-regulation, performance and self-efficacy

Presenting Author:Juan Fraile, Universidad Francisco de Vitoria, Spain; **Co-Author:**Ernesto Panadero, Universidad Autónoma de Madrid, Spain; **Co-Author:**Rodrigo Pardo, Universidad Politecnica de Madrid, Spain

According to the review of Panadero & Jonsson (2013), criteria transparency is one of the key elements to support a formative use of rubrics. Some authors have postulated from a theoretical stance that involving students in the co-creation of rubrics can have benefits such as better understanding of criteria, engagement, motivation and confidence, learning and performance (e.g. Arter & McTighe, 2001). Nevertheless, the effect of co-creating and using co-created rubrics has never been compared with the effect of using the same rubric given by the teacher, which is the main aim of this study. We explored how the use of co-created rubrics (experimental condition) for three different tasks compared to just handing-out the same rubrics (control condition) might affect self-regulation, self-efficacy, performance, task stress and students' perception in two different classroom groups. The group that co-created the rubrics showed a higher level of self-regulation as measured by thinking aloud protocols. Partial significant effects were found on self-efficacy and performance. Clear expectations and training on the use of rubrics are related with criteria transparency and can be attributed to co-creating rubrics. In the light of our results, co-creating rubrics through the collaboration of the teacher and the students is a highly recommended pedagogical enterprise.

Rubrics as diagnostically formative feedback tools – A study in compulsory schools

Presenting Author:Niels Bech Lukassen, University College of Northern Jutland / Aarhus University, Denmark

This research study addresses the challenge of providing students with quality feedback based on a co-constructed rubric. The research suggests that rubrics can be created within a framework of three cyclical elements, and include students as significant co-constructors. The study uses micro- ethnographical classroom methods that include thirty hours of recorded teaching sessions and eight student focus group interviews. The data is from two Danish compulsory schools – from seventh grade classrooms. Rubrics are defined as an educational tool analyzed with a system theoretical approach as suggested by Niklas Luhman. Rubrics hold the potential to serve as diagnostic tools with the purpose to provide both students and teachers with information of how they construct meaning. Four (selected) results are being displayed: 1) Students observe teaching and learning as very complex phenomena. 2) Students and teachers are in need of a variety of diagnostic assessment tools that assist them in understanding the learning intentions. 3) The results suggest that when teachers are implementing a whole variety of diagnostic assessment tools the students find the teaching more meaningful and motivating. 4) Rubrics hold the potential to reduce in classroom complexity and the students are in general motivated to work with rubrics.

The impact of a rubric on primary students' self-efficacy and mathematical reasoning competence

Presenting Author:Robbert Smit, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Patricia Bachmann, University of Teacher Education St.Gallen, Switzerland

Rubrics are assessment tools that help students gain complex competencies. Our quasi-experimental study aimed to evaluate an assessment instrument supporting primary teachers to teach and assess mathematical reasoning competence. Students in 44 5th and 6th grade primary classes (n = 721) in two Swiss cantons worked on their mathematical reasoning competencies. In half of the classes a standards-based rubric for peer- and self-assessment was applied. An achievement test and questionnaires for students and teachers were administered before (t1), at the end of the intervention (t2), and four months later (t3). The results of the quantitative analyses demonstrated that our intervention with the rubric significantly fosters the students' mathematical reasoning competence in the long run. The effects are mediated by self-efficacy beliefs. Classes in the rubric intervention group appeared to have more frequent peer- and self-assessment. Those classes also possessed higher self-efficacy beliefs. However, for reasoning competence there was no difference between the control and the intervention group. Within the classes the effects were different for the individual students. Students, who stated at t3 to have done more peer- and self-assessment, possessed higher self-efficacy beliefs for reasoning. Mediated by the beliefs those students also showed higher mathematical reasoning competence.

Session A 9

29 August 2017 13:15 - 14:45

Symposium

Teaching and Teacher Education

Patterns and foci of tutoring dialogues in primary classrooms

Keywords: Case studies, Inquiry learning, Knowledge creation, Mixed-method research, Primary education, Problem solving, Qualitative methods, Quasi-experimental research, Student learning, Teacher Professional Development, Teaching / instruction

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Stefanie Schnebel, University of Tübingen, Germany

Discussant: Kathrin Krammer, Switzerland

Teachers' scaffolding and forms of tutoring are considered crucial for promoting students' learning. Research shows that tutoring dialogues or scaffolding foster students' understanding and increase in knowledge especially in complex learning situations. There is some evidence, that teachers' cognitions are related to their supportive actions and that there is a crucial link between teachers' tutoring activities and the processes of problem solving and knowledge-building. However, knowledge about patterns and foci of tutoring dialogues and the linked cognitions of teachers are scarce. The symposium picks up this gap.

The first paper shows findings from a study on scaffolding in technological education in primary classes. Patterns of scaffolding and their relation to teachers' cognitions on scaffolding are investigated using a qualitative approach. The second contribution presents a qualitative study on tutoring dialogues between teachers and students in primary classes focussing on the kinds of cognitions addressed in the dialogues and the knowledge fostered. The last two papers refer to the same tri-national study which investigated teachers' knowledge, beliefs and tutoring actions in a structured learning environment in science. The first of the two papers shows the patterns of scaffolding actions, distinguishing between cognitive activation, evaluation, and regulation. In the last contribution, these patterns are related to teachers' pedagogical content knowledge and beliefs.

The symposium focuses on tutoring dialogues in primary education, brings together teachers' cognition, teachers' focused actions and effects on students' learning and aims at providing an insight into different methodological approaches used for investigating scaffolding or tutoring dialogues.

Teachers' Scaffolding in Problem Solving Tasks in Technology Education

Presenting Author: Julia Steinfeld, Duisburg-Essen University, Germany

Teachers' scaffolding is one of the most influential factors on students' learning processes, especially in primary schools (Cadima et al. 2010). Moreover, teachers' scaffolding is in particular crucial in open and problem based learning environments (Hmelo-Silver et al. 2007) which is one of the main approaches in Technology Education (Mioduser 2009, Hill 1998). Through practical problem solving children can understand the manmade world, involving using and discovering scientific concepts and skills in conjunction with design-and-make activities. The complexity and ambiguities for teachers and their scaffolding are challenging in this approach (Hmelo-Silver et al. 2007). Therefore, this exploratory case study investigates teachers' scaffolding patterns and their cognitions in problem solving tasks in Technology Education in German primary schools. Video tapes and stimulated recalls with teachers have been carried out. The coding system for analyzing the video and interview data has been developed in deductive and inductive way. The results confirm the significance of activating and structuring scaffolds and show how teachers deal with complexities in problem solving processes.

Knowledge-building patterns in educational dialogue

Presenting Author: Heli Muhonen, University of Jyväskylä, Finland; **Co-Author:** Helena Rasku-Puttonen, University of Jyväskylä, Finland; **Co-Author:** Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:** Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:** Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

Classrooms create settings of knowledge building, where ideally, students and their teacher jointly develop their understanding (Mercer, 1995). Dialogue can be considered as the facilitator of this collaborative learning process (e.g., Alexander, 2006; Lyle, 2008; Mercer, 2008). This study aimed to examine knowledge-building patterns in Grade 6 educational dialogues. The data consisted of 20 video-recorded lessons from the classes taught by seven teachers, selected by using a latent profile analysis and examined with a qualitative functional analysis of classroom talk. Episodes of educational dialogue were found to represent three main types of knowledge, based on facts, views and experiences. These three types were further identified as forming six diverse knowledge-building patterns in educational dialogues. The findings indicated that factual orientation dominated the Grade 6 lesson dialogues. However, factual knowledge building often occurred with the other two main types of knowledge. Our findings suggest that it is important for teachers to explore the possibilities of different knowledge-building patterns to acknowledge the concrete ways to scaffold educational dialogues and to guide students' learning through it.

Cognitive activating or social regulating – foci in tutoring dialogues in primary science classes

Presenting Author: Stefanie Schnebel, University of Tübingen, Germany

With the aim of increasing scientific literacy, learning arrangements are needed which enable students to learn about scientific ways of working and problem solving. Besides the tasks provided and the quality of the learning arrangements the learning support of the teachers is crucial for the learning processes (Decristan et al. 2015; Hushman et al. 2015). The international research project 'Innovations for science and technology education in the region of the Lake of Konstanz' provided 75 teachers in Austria, Germany and Switzerland with the opportunity to work with a mobile learning arrangement on the topic of flying. In the context of this research project, several aspects were studied. The sub-project presented here seeks to determine how teachers support the students in their working and learning processes. In order to achieve a detailed analysis on the support activities, teachers' actions were videotaped and coded. The codes were aggregated to the main categories cognitive activating, evaluative and regulative interventions. From the subsequent latent class analysis three types of teacher activities were derived. The findings describe types of teachers who show preferences in special dimensions of learning support.

Teachers' knowledge, professional development and learning support practice for science education.

Presenting Author: Franziska Vogt, University of Teacher Education St.Gallen, Switzerland

The paper is based on the research project on "Innovations for science and technology education" whereby 75 primary teachers were given a mobile learning arrangement on the topic of flying (physics). The analysis presented seeks to capture the interplay between teachers' professional knowledge (professional content knowledge (PCK) and content knowledge (CK)), the question of the effectiveness of interventions in form of two different professional development courses focussing on either PCK or CK and the practice of learning support. The research questions concentrate on (i) the effects of the interventions on teachers' professional knowledge, and (ii) the relation between professional knowledge and practice of learning support. Measures include questionnaires with scales on domain specific PCK, a test on CK, as well as the video analysis of teachers learning support practice (another contribution of the symposium). The results indicate the challenges of targeting specific competences through professional development. The relations between knowledge and practice can only be found in certain areas, mainly the relation between CK and PCK focussing on students' sense-making and cognitive activation and content focused structuring and evaluation, which are relevant for an understanding of professional knowledge and practice required for scaffolding.

Session A 10

Considering process features in family literacy programs: Ways and explanatory models

Keywords: Experimental studies, Literacy, Parental involvement in learning, Social interaction

Interest group:

Chairperson: Caroline Villiger, University of Teacher Education Bern, Switzerland

Discussant: Paul Leseman, Utrecht University, Netherlands

Research on family literacy confirms that family influence on the child's language and reading development is considerable (Sénéchal, 2006). Thus, many family literacy programs (FLP) have tried to implement beneficial strategies and methods in disadvantaged families, but effects on child outcomes are moderate (van Steensel et al., 2011). Recent research therefore focuses more on process features like implementation quality and parent-child interactions, in order to get more detailed insights into program success. Generally, in educational research, learning processes (e.g., quality of handling learning contents and quality of interactions when learning) are getting more attention. Even though less apparent, they are supposed to have a strong predictive power when explaining learning success of students (Hattie, 2009; Seidel & Shavelson, 2007). This symposium brings together researchers from the Netherlands, Australia and Switzerland to investigate the role that process features of FLP play in the development of the child's language and reading competence, focusing on various aspects of implementation quality and quality of parent-child interactions and their association with outcomes. The aim of the symposium is to provide new understanding about the effectiveness of FL interventions as a function of a successful implementation of a method (rather than the implementation of a "successful method"). Implications for future research and for implementation in practice are provided.

Outcomes and implementation quality of a Dutch family literacy program: Early Education at Home

Presenting Author: Sanneke de la Rie, Rotterdam University of Applied Sciences, Netherlands; **Co-Author:** Roel van Steensel, Erasmus University Rotterdam, Netherlands

Family literacy programs (FLPs) aim to promote children's literacy development by stimulating their home literacy environments (HLE), particularly in at-risk families. Observed differential effects for these families raise questions about their capability of implementing FLPs optimally. However, a dearth of data on FLP-implementation was observed (De la Rie et al., 2016; Sénéchal & Young, 2008). In this study we measured various aspects of implementation quality of the FLP 'Early Education at Home' (EEH) and related these to program effects. EEH aims to promote kindergartners' language and literacy skills by stimulating their parents to engage them in literacy-related activities and by teaching parents strategies for realizing stimulating interactions. We hypothesized 'enactment' (Powell & Carey, 2012) variables (HLE, parent self-efficacy, quality of parent behavior and language) to serve as mediators of EEH-effects, which we tested using multi-level SEM. We expected program 'receipt' (parental attendance at training sessions, program activities conducted) to predict program outcomes, which we tested using multi-level regression. Seven primary schools participated in this quasiexperimental study, involving 119 children (*Mean* at pre-test: 64 months) in the experimental condition and 98 controls, and their parents (60% low-middle educated). No significant EEH-effects were found, and neither enactment nor receipt variables influenced child outcomes. Parent self-efficacy and quality of parent behavior and language significantly predicted child outcomes. Explanations for the lack of EEH-effects, in terms of delivery of EEH to parents, parental implementation of EEH, and contextual/intervention features, are discussed. We conclude with suggestions for future research and implications for program developers.

Paired Reading with parents' or volunteer tutors: Do process features explain differential effects?

Presenting Author: Caroline Villiger, University of Teacher Education Bern, Switzerland; **Co-Author:** Silke Hauri-Junghans, Pädagogische Hochschule FR, Switzerland; **Co-Author:** Annette Tettenborn, University of Teacher Education of Lucerne, Switzerland; **Co-Author:** Isabelle Hugener, University of Teacher Education Lucerne (PH Luzern), Switzerland; **Co-Author:** Manuela Frommelt, University of Teacher Education of Lucerne, Switzerland; **Co-Author:** Catherine Naepflin, University of Teacher Education of Lucerne, Switzerland

Paired Reading (PR) is a very established method to enhance reading fluency and comprehension of young or struggling readers (Topping, 2001) whose effects are widely confirmed by many authors (e.g., Lam et al., 2013; Silva, et al., 2008; Topping & Lindsay, 1992). However, little is known about detailed mechanisms of the method. Therefore, this study investigates mediating effects of process features like interaction and implementation quality on outcome variables, in order to disentangle effects of the acting person (tutor) and the method. A PR program with randomized control group design was implemented with 3rd Grade students by comparing two training conditions – parents' and volunteer tutors (parents' *N* = 67, volunteers' *N* = 64; control group *N* = 68). Volunteer tutors outperformed parents' tutors and the controls: Children who trained with volunteers developed significantly better in reading fluency when controlling for individual characteristics and initial reading level. In contrast, no effects were found on comprehension in none of the two conditions. Analyses of video data of one videotaped training session per pair (*N* = 113, without control group) showed that parents praised the child significantly less and showed less warmth than volunteers did when interacting with the child. Moreover, volunteers talked significantly more about book content than parents, however, they did not differ significantly in other aspects of

implementation. Further analyses will investigate whether effects on fluency were mediated by process factors like praise, warmth or content-related conversation. Findings are discussed with regard to future implementation of PR training in practice.

Stimulating parent-child interaction through storytelling activities of a family literacy program

Presenting Author:Rosa Teepe, Radboud University Nijmegen, Netherlands; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Ron Oostdam, University of Applied Sciences Amsterdam, Netherlands; **Co-Author:**Ludo Verhoeven, Radboud University Nijmegen, Netherlands

Preschool vocabulary knowledge develops mainly informally via parent-child interaction. Family literacy programs (FLP's) aim to promote children's vocabulary by supporting parent-child interaction quantity and quality. In addition to traditional storytelling activities that are part of FLP's (such as shared book reading), we developed a technology-enhanced storytelling (TES) activity including real time interaction support. In this study we investigate parent-child interaction of dyads involved in the regular FLP ($n = 15$), FLP plus TES ($n = 15$) and controls ($n = 15$) during a storytelling activity. We examine the effect of the FLP and FLP plus TES on the quantity and quality of parent-child interaction over time and associations with children's vocabulary development. Dyads were observed four times during a school year doing a paper-based and technology-enhanced storytelling activity each time. Analyses show that at Time 1 (after 6 weeks of FLP), no significant differences were found in the interaction quantity and quality of dyads involved in the FLP and the control condition. Moreover, large differences among parent-child dyads in the quantity and quality of interaction were found, indicating the diversity among dyads. Analysis of the other three time slots will examine the development of parent-child interaction over time, and associations with children's vocabulary development. This will provide insights in how an FLP influences parent-child interaction over time, how much implementation time is required for an FLP to be effective, and how development of parent-child interaction relates to vocabulary.

Beyond the text: fathers and mothers engaging with their toddlers around a book

Presenting Author:Elisabeth Duursma, University of Wollongong/Early Start Research Institute, Australia

Shared parental bookreading is known to benefit children's language and literacy development (e.g., Bus, Van IJzendoorn, & Pellegrini, 1995; Mol & Bus, 2011). However, what happens during a book reading interaction is perhaps even more important than the reading of the text itself. This study examined the strategies 25 Australian fathers and mothers used during shared bookreading with their 2-year-olds using an existing coding system developed by Fletcher & Finch (2015). Strategies included asking questions, labelling, expansions and positive feedback. Initial results indicated that both parents used a wide range of strategies and focused on labelling and asking questions. The association between parental strategies and child language, social, emotional and cognitive development will be discussed.

Symposium

Teaching and Teacher Education

Teachers' professional competences, instructional quality and student learning outcomes

Keywords: Competencies, In-service teacher education, Mathematics, Mixed-method research, Quantitative methods, Secondary education, Student learning, Teacher Effectiveness, Teacher Professional Development, Teaching / instruction

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Christian Bruehwiler, University of Teacher Education St.Gallen, Switzerland

Discussant: Trude Nilsen, University of Oslo, Norway

Owing to the importance of teachers' professional competences for effective academic learning processes, teacher education is currently subject to high expectations. In concrete terms, teacher education programmes are supposed to 1) prepare future teachers for a successful entry into the teaching profession by developing and fostering their professional competences. This should lead 2) to high-quality instruction, and finally 3) to higher student learning Outcomes. The symposium explores different aspects of this threefold expectation of effectiveness teacher education ought to meet. The first presentation focuses on the development of teaching competences in the context of a video-based intervention. The intervention was implemented in a teacher preparation programme, and aims to promote constructivist ways of teaching. Thereafter, the second presentation sets out to analyse the interrelations between mathematics teachers' knowledge, their skills and their performance in the classroom. The third presentation then addresses the question of how teachers' general pedagogical knowledge (GPK) relates to the quality of their instruction. In this study, GPK was assessed via a standardised paper-pencil test and by means of a video-based measure of situation-specific skills in classroom management. Completing the picture, the last presentation goes into the effects of teachers' professional knowledge and beliefs about mathematics learning on instructional quality and student achievement. Overall, the findings contribute to a better understanding of the development of teaching competences and the impact of teachers' professional competences on instructional quality and student learning. Moreover, the symposium provides a platform for discussing different ways of measuring situation-specific skills.

Video-based Promotion of Teaching Competences in Teacher Education

Presenting Author: Mirjam Kocher, University of Education Zurich, Switzerland; **Co-Author:** Matthias Baer, Educational University Zurich, Switzerland; **Co-Author:** Christine Villiger, Educational University Zurich, Switzerland; **Co-Author:** Anna Locher, Educational University Zurich, Switzerland

How to promote teaching competences in teacher education is still a relatively un-researched field. The presentation first shed a light on some elected results from previous studies, which show that lessons of student and experienced teachers contain primarily direct instruction and rather low cognitive demand. Then results of a new intervention study are presented. This study aims the promotion of constructivist ways of teaching instruction in teacher education with a video-based intervention. A central element of the intervention is the analyses of and the reflection on own lesson videos by student teachers and by experienced teachers. The study participants are student teachers of the Educational University of Zurich and experienced teachers, who are mainly involved in the training of the student teachers as mentors. The focus of the intervention is on the adaptive promotion of (1) the student teachers and (2) the experienced teachers by video lessons, which they taught by themselves in the subject German. Additionally data from control groups are recorded without intervention. The intervention is implemented in the regular schedule of the Educational University during three semesters. The effects of the intervention is investigated in a multiperspective way by eight data collection instruments over four measurement points. By the time of the EARLI-conference we will show results about the development of teaching competences within the intervention groups and the control groups. Additionally differences between the intervention groups and the control groups will be presented.

Relations between mathematics teachers' knowledge, skills and instructional quality

Presenting Author: Armin Jentsch, University of Hamburg, Germany; **Co-Author:** Lena Schlesinger, University of Hamburg, Germany; **Co-Author:** Gabriele Kaiser, University of Hamburg, Germany; **Co-Author:** Ute Suhl, Humboldt-University Berlin, Germany; **Co-Author:** Sigrid Blömeke, University Oslo, Norway

Research on both teachers' professional competencies and teachers' performance in the classroom has been of major interest in mathematics education. In the present study, we analyze how mathematics teachers' knowledge, their skills and their performance in the classroom are related to each other. To assess the teachers' professional knowledge and skills, we used established instruments. An observational protocol was developed based on an extensive literature review. Factor analyses were conducted to investigate the dimensionality of instructional quality. All reliability measures indicate at least satisfactory results. Latent correlations were calculated. The resulting relations between cognitive skills and performance are discussed within the last years.

Effects of teachers' pedagogical knowledge and skills on their instructional quality

Presenting Author: Caroline Nehls, University of Cologne, Germany; **Co-Author:** Johannes König, University of Cologne, Germany; **Co-Author:** Armin Jentsch, University of Hamburg, Germany; **Co-Author:** Lena Schlesinger, University of Hamburg, Germany; **Co-Author:** Gabriele Kaiser, University of Hamburg, Germany; **Co-Author:** Andreas Busse, University of Hamburg, Germany; **Co-Author:** Sigrid Blömeke, University of Oslo, Norway

Pedagogical knowledge has been identified as a relevant category of teacher knowledge, but hardly any study has examined its relationship to instructional quality. In this presentation, therefore, we analyze how (1) teachers' general pedagogical knowledge (GPK) assessed via a standardized paper-pencil test as well as (2) a video-based measure of situation-specific skills to manage the classroom are related to the quality of teachers' instruction delivered to students. A sample of 113 in-service mathematics teachers from middle schools in Hamburg, Germany, is used, deriving from the project TEDS-Instruct. The teachers were assessed via instruments that our research group had developed in previous studies. Observation protocols were applied to capture the instructional quality, covering the three basic dimensions of instructional quality (cognitive activation, classroom management, constructive support). In the presentation, instruments are outlined and findings from scaling analysis, inter-correlation, regression, and mediation analysis will be presented. Evidence will be provided that situation-specific skills in the area of classroom management serve as a more proximal predictor for instructional quality than teacher knowledge. Implications of findings and suggestions for future research will be discussed.

Impacts of teachers' professional knowledge and beliefs on teaching quality and student achievement

Presenting Author: Christian Bruehwiler, University of Teacher Education St.Gallen, Switzerland; **Co-Author:** Lena Hollenstein, University of Teacher Education St.Gallen, Switzerland; **Co-Author:** Benita Affolter, University of Teacher Education St.Gallen, Switzerland; **Co-Author:** Titus Guldemann, University of Teacher Education St.Gallen, Switzerland

It is common ground in educational research that teachers' professional competence is essential for effective academic learning processes. In general, the professional competence is thought to be composed of cognitive and non-cognitive aspects. With specific regard to mathematics education, the cognitive aspects of teachers' professional competence include mathematics content knowledge (MCK), mathematics pedagogical content knowledge (MPCK), and general pedagogical knowledge (GPK), whereas beliefs about mathematics learning are considered to be non-cognitive aspects. Within the context of the longitudinal study *Outcomes of Teacher Education* (German: *Wirkungen der Lehrerbildung*, WiL), which is a Swiss extension of the international comparative study TEDS-M, we build on these assumptions and investigate

the effects of professional knowledge and beliefs about mathematics learning on teaching and student achievement. The sample comprises 30 primary teachers (three years after graduation) and 548 students. Our results show a significant effect of MCK and GPK on student achievement gains in mathematics. Furthermore, it was found that a higher extent of GPK contributes to a higher quality of instruction. As far as teachers' beliefs about mathematics learning are concerned, our analyses point to a significant impact on instructional quality, but they did not reveal significant effects on student achievement. These findings shall be discussed in terms of the importance of teachers' professional knowledge and beliefs for effective academic learning processes.

Session A 12

Symposium

Teaching and Teacher Education

Collaborative teaching and inclusion: benefits and challenges

Keywords: Attitudes and beliefs, Case studies, In-service teacher education, Mixed-method research, Primary education, Qualitative methods, Quantitative methods, Special education, Teacher Professional Development, Teaching / instruction

Interest group: SIG 15 - Special Educational Needs

Chairperson: Susanne Schwab, University of Wuppertal, Germany

Discussant: Ineke Pit-ten Cate, University of Luxembourg, Luxembourg

The importance of collaborative teaching practices between classroom teachers and special needs teachers has been emphasized as important for successful inclusive education. However, relatively little is known about collaborative educational practices, how teachers experience these and how they are related to attitudes and beliefs. These issues are addressed in this symposium, by means of quantitative, qualitative and mixed-methods studies. The first study uses structural equation modeling to illustrate the importance of teachers' experiences and attitudes for their willingness to cooperate in inclusive education. The second study including Learning Support Teachers, Resource Teachers and Classroom Teachers sought to establish the nature and extent of collaboration amongst teachers and to identify the benefits and barriers to implementation. It was shown that teachers value collaboration and are motivated to implement it, but that challenges lie in planning, time constraints and limited professional development opportunities. The third study aimed to shed light on the preparation and daily practice of beginning co-teachers and to find out if co-teaching can be a means to reduce the outflow of pupils to special education. Co-teachers and the organizations in which they worked used one year to prepare for implementation by means of training, international collegiate consultation and planning. Next, co-teaching was implemented in their schools. Co-teaching appeared very significant for professional development. It was experienced as very motivating as teachers felt they were realizing sustainable change in the institutional process of creating appropriate education for all.

Under which conditions do primary school teachers cooperate in inclusive education?

Presenting Author: Frank Hellmich, Paderborn University, Germany; **Co-Author:** Susanne Schwab, University of Wuppertal, Germany; **Co-Author:** Fabian Hoya, Paderborn University, Germany; **Co-Author:** Gamze Görel, University of Paderborn, Germany

Cooperation between primary school teachers and special education teachers is an important prerequisite in inclusive education. Until now, little is known about the willingness of primary school teachers to cooperate with special education teachers in inclusive schools. Therefore, we investigated $N=168$ primary school teachers' willingness to cooperate in inclusive education, their attitudes towards inclusion, their experiences in joint education of students with and without special educational needs, their self-efficacy beliefs and their attitudes regarding teamwork. The results of a structural equation model illustrate the importance of attitudes regarding teamwork and primary school teachers' experiences in joint education of students with and without special educational needs for their willingness to cooperate in inclusive education.

Collaborative classroom practice for inclusion

Presenting Author: Susanne Schwab, University of Wuppertal, Germany; **Co-Author:** Una O'Connor Bones, Ulster University, United Kingdom

Collaborative practice is integral to effective inclusion. Within schools, teacher collaboration can foster communities of practice through a series of professional relationships that enhance the educational experience and learning outcomes of pupils with special educational needs (SEN). In Ireland, Learning Support Teachers (LSTs) and Resource Teachers (RTs) provide additional support to the increasing numbers of children with SEN in mainstream classrooms. Working alongside Classroom Teachers (CTs), this tripartite of teaching expertise represents an opportunity for whole-school and classroom-based approaches to successful collaborative, inclusive practice.

This presentation describes the perceptions and experiences of collaborative practice between primary CTs, RTs and LSTs in a cohort of primary schools in the West of Ireland. Using a mixed methods approach, the study sought to establish the

nature and extent of collaboration amongst these teachers and to identify the benefits and barriers to implementation. The findings suggest that whilst teachers are increasingly aware of the value of collaboration, its implementation is largely aspirational, with a series of challenges relating to time constraints, ad hoc planning and limited professional development opportunities most commonly identified as constraints to a consistent approach. The article considers the consequences of this shortfall and options for improved engagement between teachers are identified.

Co-teachers as change agents towards more inclusive education

Presenting Author:Elke Struyf, University of Antwerp, Belgium; **Co-Author:**Dian Fluijt, University of Applied Sciences Utrecht, Netherlands; **Co-Author:**Cok Bakker, UCR / Utrecht University, Netherlands

Purpose: Four primary schools participated in a three years pilot in which co-teaching was considered as a means to realize more inclusive education. The aim of the research was to study the preparation and daily practice of beginning co-teachers in order to achieve a higher goal: to find out if co-teaching can be a means to reduce the outflow of pupils to special education. During the first year, sixteen co-teachers prepared themselves and their organization for the implementation of co-teaching by means of training, international collegiate consultation and planning. During the second and third year the co-teachers practiced co-teaching in their schools.

Method: We collected naturally occurring and organized data. Naturally occurring data were our field notes from the co-teaching training, collegiate consultation, work- and intervision meetings and film and photo shoots. The organized data consisted of data collected with a reflection instrument (interview) and a survey.

Results: Data collection revealed that co-teachers experienced a deep meaning for their work, experienced fun, professional development and ownership in the work. Further they felt supported by the co-teaching partner(s). Co-teachers indicated the importance of having an open attitude, to be reflective and to feature solution-oriented communication skills. The pilot demonstrates that the co-teaching teams in each school developed as small intrinsic motivated collegial sub networks who felt able to realize effective and sustainable change in a diverse, comprehensive and diverse organizational process as initiated by the recent law to create more appropriate education for all.

Collaboration for Inclusive Education - "It is just there on paper"

Presenting Author:Estelle Swart, Stellenbosch University, South Africa; **Co-Author:**Mirna Nel, North-West University, South Africa

To become inclusive, schools and classrooms should focus on how to operate as communities where everyone experiences a sense of belonging, is accepted, supports and is supported by all members of the school community. In practice it means that all educational practices should be inclusive, including providing integrated support services through intersectoral collaboration to address a range of internal and external barriers to learning. To realise this, transdisciplinary collaboration within an inclusive learning support framework is essential. As part of a larger project several qualitative studies focusing on how South African teachers understand collaboration within a learning support framework have been conducted.

One of the central findings of this study was that teachers still conceptualise learning difficulties from a medical perspective and consequently refer individual children to specialists for assessments, support and placement in a school environment where they will receive specialist support. The main concern of this paper is that developing sustainable collaborative practices for addressing barriers to learning seems to be a persistent challenge in South Africa. The reasons include amongst others low teacher morale; limited understanding of inclusive education; teachers' perception that they don't have the required knowledge and skills to teach all pupils, more specifically those experiencing barriers to learning; lack of resources and support and large classrooms.

Session A 13

29 August 2017 13:15 - 14:45

Main Building D - D10B

Symposium

Motivational, Social and Affective Processes

Productive collaboration contextualized in science learning: Theorizing the role of antecedents

Keywords: Collaborative Learning, Educational Psychology, Higher education, Motivation and emotion

Interest group: SIG 08 - Motivation and Emotion, SIG 10 - Social Interaction in Learning and Instruction

Chairperson: Toni Rogat, Purdue University, United States

Chairperson: Simone Volet, Murdoch University, Australia

Discussant: Martina Nieswandt, University of Massachusetts Amherst, United States

To yield the benefits for deep-level understanding, students working in small groups need to go beyond simple participation to engage in ways that translate their motivations into productive collaborative learning. Productive collaborative processes involve drawing connections between concepts with disciplinary practice during knowledge co-construction and task completion. Ensuring students engage in these high-quality collaborative processes is a valued outcome of higher education. The collection of presentations in this symposium are at the frontiers of research investigating *explanatory*

antecedents central to productive collaborative processes contextualized within science learning (e.g., veterinary medicine, teacher education, physics, and engineering). The symposium offers diversity in presentation given the study of a range of antecedents including student motivation, epistemological beliefs, and engagement. The papers present a cohesive set in (1) empirically investigating antecedents of productive collaboration and/or their relation to actual collaborative processes, (2) using novel theory-driven frameworks and (3) relying on rigorous methods that draw on two data sources (e.g., self-report surveys, interviews, video-taped observations) and accounting for two levels of analysis (i.e., group and individual level).

Students' epistemic beliefs about group process as antecedents for collaborative interactions

Presenting Author:Toni Rogat, Purdue University, United States; **Co-Author:**Ala Samarapungavan, Purdue University, United States; **Co-Author:**Clark Chinn, Rutgers University, United States; **Co-Author:**Temitope Adeoye, Purdue University, United States; **Co-Author:**Todd Shuba, Purdue University - West Lafayette, United States

One underlying antecedent of productive collaborative interactions may be students' epistemological beliefs about group learning as a reliable process for developing knowledge. Here, we are conceptualize the beliefs students hold about the role of groups for their individual learning and about the types of group interactions that benefit understanding. This can include beliefs ranging from how groups are best structured, to beliefs about forms of discourse, or beliefs about how learning can best be co-regulated. While previous work indicates epistemological beliefs influence employed strategies and learning, this research has focused on individual learning without considering social processes. Prior research suggests that group conceptions can be modified with opportunities to collaborate in the context of curriculum affording meaningful activity. However, previous studies rely on questionnaires, which do not elicit students' detailed beliefs, such as *how* and *why* interacting with peers enriches knowledge. In the current study, we examine the standards university students in veterinary medicine, with their group, report in open-ended surveys and interviews related to the (1) task product, (2) group strategies, and (3) group processes during collaborative activity in a problem-based learning units when solving authentic cases. Results indicate that when asked to discuss characteristics of good solutions to veterinary problems, students most frequently invoked the use of good group processes as a characteristic of good solutions. This indicates that students view the reliability of processes as an important indicator of high-quality solutions. This belief is very compatible with reliabilist approaches to epistemic cognition.

Interdependent impact of diverse motivational profiles in student-led collaborative learning

Presenting Author:Simone Volet, Murdoch University, Australia; **Co-Author:**Marja Vauras, University of Turku, Finland; **Co-Author:**Cheryl Jones, Murdoch University, Australia

While in student-led collaborative learning, group-level interaction analyses in relation to the quality of joint activity have unveiled meaningful patterns of cognitive engagement and key participatory roles, the antecedents of productive collaboration have received limited attention. Even less known is the impact of group members' antecedent motivational profiles relevant to the group activity. Our aim is to study how students with diverse profiles engage in and influence productive collaborative learning. Matched pre-post questionnaires were given to 108 first year university teacher students in a science unit including small group laboratory activities, which were video recorded. Based on seven motivation/affect variables (e.g., interest in science, science self-efficacy, science anxiety), four clusters were identified in both pre and post data: Vulnerable, Disengaged, Promising and Optimal. Evolving profiles were established on the basis of pre and post data clusters, e.g. Vulnerable becomes Disengaged or Promising Optimal. Four groups, differing in members' evolving motivational profiles, were analysed in terms of their on-going engagement. Two individual-level analysis methods (role and metacognitive regulation) were used to determine the quality of individual contributions towards productive group engagement. Associations of antecedents data (motivational profiles, prior science knowledge) to actual engagement (roles, regulatory functions) were examined at individual and group configuration level. Preliminary results indicate that individuals' motivational profiles as well as diversity of profiles within the group contribute to affording or constraining productive engagement. In discussion, we stress the systematic approach to understand the impact of motivational profiles in productive collaborative learning and for educational practice.

Investigating the antecedents to productive collaboration in physics teams

Presenting Author:Susanne Lajoie, McGill University, Canada; **Co-Author:**Maedeh Kazemitabar, McGill University, Iran; **Co-Author:**Emanuela Buonamici, McGill University, Canada

This exploratory study examines the antecedents to productive collaboration in physics teams (n=17) who compete at a one-day physics competition. Productive collaboration is based on social regulation as well as content regulation. In particular, we examine the teams' regulation processes during collaborative learning in the context of the social challenges faced during team work. An instrument designed to capture the nature of the regulation processes students employ during collaborative learning was used to capture students' goals for participating in the competition along with the challenges they experienced. Using a mixed methods case study approach we found that teams who reported lower levels of reported challenges were more effective at team collaboration. Preliminary results showed that apart from individual student goals, teams who demonstrated more team-based goals, had prior familiarity with each other, and collaborated with more instances of positive social emotional interactions ranked better in the competition.

The role of histories, contexts and interactions in shaping engagement

Presenting Author:Susan Nolen, University of Washington, United States; **Co-Author:**Milo Koretsky, Oregon State

University, United States

This research study focuses on the relationship between antecedents and productive collaborations in STEM contexts. Antecedents are often seen as characteristics or conditions prior to or at the start of the “main show,” in this case, collaborative learning. Taking a situative perspective, however, boundaries between “before” and “during” are not so clear cut. Histories of individuals and the groups in which they participate are continuous, stretching into the past and into the future, and interacting in a continuously moving “present.” We present a case study that examines the role of individual and group histories, along with affordances of the project, in shaping engagement and learning throughout a university capstone course for engineers. The implications of findings for designing projects bridging school and real world contexts are discussed.

Session A 14

29 August 2017 13:15 - 14:45

Pinni B - B1096

Symposium

Instructional Design

Designing tasks that foster learning

Keywords: Assessment methods and tools, Cognitive skills, Educational Psychology, Higher education, Instructional design, Reading comprehension, Writing / Literacy

Interest group: SIG 06 - Instructional Design

Chairperson: Antje Proske, TU Dresden, Germany

Discussant: Joerg Zumbach, University of Salzburg, Austria

A variety of tasks have been shown to enhance retention of information. However, learning requires more than rote memorization. Success in the classroom draws upon comprehension, integration, and transfer. In this symposium, we explore how tasks that leverage cognitive, metacognitive, and/or motivational processes can support these complex learning outcomes through active knowledge construction. As an introduction, we will discuss the distinction between on-line and off-line tasks, as well as the processes and products addressed in the extant body of memory, comprehension, and learning research. We then present empirical investigations of different conditions for effective learning tasks. First, we report on the importance of identifying task demands for learning success. Second, we show that encouraging learners to generate and answer questions by themselves is particularly effective for learning from text when learners generate deep-level questions or questions intended for tutoring. Finally, we discuss the benefits of answering questions on students' ability to use information from text in source-based essays. This symposium will foster discussion about the design of powerful educational interventions that promote active construction and deep understanding.

On-line and Off-line Tasks to Foster Learning from Text

Presenting Author: Danielle McNamara, Arizona State University, United States; **Co-Author:** Kathrin McCarthy, Arizona State University, United States; **Co-Author:** Scott Hinze, Virginia Wesleyan College, United States

This talk provides an introduction to this symposium focused on designing tasks to foster learning from text by providing background on learning in the context of comprehension research and theory to establish the types of processes and products involved in learning. Based on these foundations, we review tasks that enhance comprehension on-line (encoding during reading) or off-line (testing after reading). Despite the overlap in learning goals of on-line and off-line tasks, little research has directly compared these techniques or explored their potential interactions. Finally, we discuss potential future research on these types of tasks. These comparisons have strong potential to differentiate the mechanisms responsible for the benefits of comprehension tasks, while providing potentially powerful tools for educational interventions.

Measuring task model construction while working with multiple documents

Presenting Author: Jean-Francois Rouet, University of Poitiers, France; **Co-Author:** Raquel Cerdan, Faculty of Psychology, University of Valencia, Spain; **Co-Author:** Eduardo Vidal-Abarca, Universidad de Valencia, Spain; **Co-Author:** Silvia Giménez, University of Valencia, Spain

Theories of task-oriented reading assume that readers construct a representation of the task demands (or task model) that guides their decisions of what to read and how to read it. This study examined the role of undergraduate students' encoding of search questions in their success at responding the questions based on a set of three related texts on the topic of advertisement. Our main goal is to propose a measure that captures individual differences in task encoding. Forty first-year undergraduate students read three complementary texts on advertisement and answered ten comprehension questions. In addition, they were asked to solve a task model assessment on each question by indicating which paraphrase, among three options, better reflected what the question said. Results indicate that success in identifying task demands seems to be related to precision in answering and in learning from the texts. Suggestions for future research are provided.

Fostering Text Comprehension by Encouraging Students to Generate and Answer Their Own Questions

Presenting Author: Gregor Damnik, TU Dresden, Germany; **Co-Author:** Antje Proske, TU Dresden, Germany; **Co-Author:** Hermann Körndle, TU Dresden, Germany; **Co-Author:** Susanne Narciss, TU Dresden, Germany

Recent research has shown that encouraging students to generate and answer questions during studying an expository

text can foster students' comprehension to a great extent. However, different instructions may affect how well this learning technique promotes students' knowledge acquisition. In the present paper, two factors that may be mainly responsible for differences in this regard will be investigated. In a three-by-two factorial design participants had to either reread an expository text or to study this text and to generate and answer questions. If the latter was the case, participants were either trained to generate shallow or deep level questions. Furthermore, participants completed their assignment either for the purpose of tutoring or for their own knowledge acquisition. Results indicate that generating and answering questions is a powerful technique to foster students' comprehension. This is particularly true if students are instructed to generate questions for the purpose of tutoring or if they are encouraged to generate and answer deep level questions.

Improving academic writing by macro-structural questions that support source text comprehension

Presenting Author:Antje Proske, TU Dresden, Germany; **Co-Author:**Felix Kapp, TU Dresden, Germany; **Co-Author:**Susanne Narciss, TU Dresden, Germany

In academic writing writers often compose from sources. One possibility to support source-based essay writing is to provide questions which facilitate source text comprehension by initiating macro-strategies. In order to examine whether the provision of macro-structural questions during studying source texts leads to better results in academic writing both writing process and performance of a group supported by these questions was compared to a study-only group which read the source texts without answering questions. Results revealed that students provided with macro-structural questions wrote longer essays and spend significantly more time prewriting and writing/revising their essays than did the students of the study-only group. Studying source texts with macro-structural questions resulted in text products of better readability and partly better accuracy and coverage of content. These findings suggest that engaging students in answering macro-structural questions when reading source texts can positively affect both writing process and performance.

Symposium

Lifelong Learning, Teaching and Teacher Education

Advances in studies on agency and development in educational settings; concepts and methods

Keywords: In-service teacher education, Informal learning, Lifelong learning, Qualitative methods, Quantitative methods, Teacher Professional Development, Workplace learning

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Jeroen Imants, Radboud University Nijmegen, Netherlands

Discussant: Michael Goller, University of Paderborn, Germany

The aim of this symposium is to discuss advances in research on agency and development in educational contexts. Conceptual and methodological issues will be discussed, as well as their interrelationships. In current research many definitions and approaches of agency can be identified. A question is if diversity should be regarded as enriching, or as creating conceptual vagueness and complexity. Another question is how qualitative and quantitative methods are employed, and if this might be related to diversity in definitions and approaches. An educational issue is which role agency can play in development and innovation. Agency can be powerful in stimulating development in educational contexts. The transformative potential of agency can be restricted by structural aspects. The question is how agency research can illuminate this interplay between agency and educational context. In this symposium four studies are presented that shed light on these three questions. Two small scale studies analyze the role of agency in development and reform in complex and difficult educational settings. The third study analyzes methods that were applied in 11 research projects on agency in educational contexts. The fourth study develops a model in which agency is the linking concept between professional development and reform. Each paper will be presented with a focus on the three questions. Presentations are followed by questions and comments from the discussant, addressing the three question. Then, the presenters are invited to take place in an 'open fishbowl' to discuss the comments. Audience is invited to participate in this discussion format.

Agency-promoting leadership in transforming organizational practices in Finnish teacher education

Presenting Author:Päivi Hökkä, University of Jyväskylä, Finland

This study examines transforming teacher education by focusing on agency-promoting leadership in one Finnish teacher education department. In the framework of a subject-centred sociocultural approach, the study elaborates on the main challenges, pitfalls and insights in transforming teacher education practices into a more innovative model. Agency is understood to be manifested when professional subjects and/or communities make choices, take stances and have an influence on their work and professional identities. Agency-promoting leadership refers to the idea that educational organizations should be managed and led through communication, collaboration and interaction, highlighting people, relationships and learning, rather than strong management, externally set standards and accountability culture. The main data consist of videotaped group discussion, in which the four leaders of the teacher education department (the head, deputy, research leader and pedagogical leader) recall their shared leadership history and the most critical events in the department during 2006-2013. The data are analyzed via qualitative approaches, applying thematic analysis. The findings

imply that in leading teacher education transformations collective leadership is salient. In creating collective leadership leaders are asked to understand the meaning of professional identity and to renegotiate their professional identities as leaders. It is also critical that the leaders promote the professional agency of their personnel during the transformation processes. This study suggests that agency-promoting leadership can act as an intertwining coupling between organizational transformations and individual professional learning and identity renegotiation.

Exploring in-service teachers 'sense of agency: changes after participating in a Master program

Presenting Author:Giuseppe Ritella, University of Helsinki, Finland; **Co-Author:**Maria Beatrice Ligorio, Università degli Studi di Bari, Italy; **Co-Author:**Maria Antonietta Impedovo, Aix Marseille University, France

In this research we are interested in understanding changes in how sense of agency is expressed by in-service teachers coming from difficult socio-economic conditions, as consequence of participating in a Master program. A semi-structured interview was administrated to nine in-service teachers, coming from three African countries. The data collected was qualitatively analysed through a coding system based on five types of agency (Subjective, Relational, Epistemic, Transformative and Collective), all designed based on the existing literature. The five themes concerning agency are not mutually exclusive, considering the complexity of the concept and the difficulties in the operationalisation of the abstract concept of agency. Therefore, to assign the statements to the right type of agency, we combined a linguistic analysis (explicit meaning) with a discourse analysis (implicit meaning) by looking at different linguistic features such as the description of the speaker's desires and intentions. Teachers describe various types of agency, as expressed in their relationships to colleagues, students, and the community

Assessing contemporary research on agency—a methodological perspective

Presenting Author:Crina Damsa, University of Oslo, Norway; **Co-Author:**Dominik E. Froehlich, University of Vienna, Austria; **Co-Author:**Andreas Gegenfurtner, Technische Hochschule Deggendorf, Germany

In this presentation, we review eleven contemporary empirical research papers about agency in educational settings. Rather than giving a general impression of the methodological approaches used in the field, we focus on very recent research endeavors only--at the time of writing, all eleven papers are in press and part of an agency-themed edited volume. At the same time, these papers capture a large variety in terms of region (e.g., Australia, Belgium, Chile, Indonesia), industry (e.g., education, healthcare, information technology), methodological approaches (qualitative, quantitative, and mixed method approaches), and feature different flavors of the main concept (e.g., creative agency, relational agency, agentic feedback-seeking, transformative agency). This variety of contexts, methods, and concepts is what has potential to advance our understanding of the concept of agency. However, this variety also creates a problem of integration--how can empirical studies that are conducted in different contexts, with different methods, and with slightly different interpretations of the core concept be reconciled? In this review, we critically assess the empirical and methodological contributions and their theoretical and practical implications. This step of reflection and review is important, as the huge variety of pathways adopted to measure and conceptualize a focal phenomenon needs to be narrowed down to what works (in the given circumstances) to inform future research.

Bridging teacher professional development and school reform; the role of agency

Presenting Author:Jeroen Imants, Radboud University Nijmegen, Netherlands; **Co-Author:**Merel van der Wal, Radboud University Nijmegen, Netherlands

Teacher agency is identified as an important factor in professional development and school reform. In studies on workplace learning, the role of agency has recently gained attention. We developed a model in which professional development and school reform are linked by means of the concept of teacher agency and insights in workplace learning. The aim of this paper is to present and to use the integrated model as a tool to analyze and interpret assumptions in teachers' professional development and school reform research. Based on the model, an instrument is constructed and applied for the analysis of empirical studies on teacher professional development and school reform. 44 recent research articles on agency and reform / development were analyzed. Results show that the model is a dynamic framework to describe professional development and reform at both organizational and individual levels, and to explicate teachers' agentic role in the enactment of content and strategy of professional development and reform, and the interaction with outcomes. The model integrates agency in interaction with structural aspects and provides a conceptual connection between school reform and professional development literature. As such, it serves as an extension of previous theoretical models of professional development towards integration of change context and school context in in terms of workplace learning. Practically, the model provides an analytical framework to evaluate professional development and school reform from an agentic perspective. This offers opportunities for an all-round evaluation of professional development and school reform, initialized either top-down or bottom-up.

Symposium

Learning and Social Interaction, Motivational, Social and Affective Processes

Interactions with teachers, peers and parents: joint contributions to child development in school

Keywords: Achievement, Developmental processes, Early childhood education, Motivation, Peer interaction, Social development, Social interaction, Teaching / instruction

Interest group: SIG 05 - Learning and Development in Early Childhood , SIG 10 - Social Interaction in Learning and Instruction

Chairperson: Karine Verschueren, KU LEUVEN, Belgium

Discussant: Erin McTigue, University of Stavanger, Norway

According to bio-ecological models, children's development is shaped by their relationships and interactions in their proximal environment. In preschool and elementary school, key social actors are teachers, peers, and parents. Whereas previous literature has supported the role of each of these relationships as a context for development, research on their interplay and joint impact on child development at school is lacking. Moreover, with regard to teacher-child interactions, the relative contribution of different interaction levels (i.e., dyadic vs. classroom) remains unclear. This symposium brings together four longitudinal studies from four countries that examine the joint effects of social interactions at different levels for children's behavioral and academic development. Interactions and relationships are assessed using observations and/or teacher reports. The first study ($N = 187$ children in 43 classes) examines the role of dyadic and classroom-level dimensions of teacher-student interactions for the development of preschoolers' language and self-regulation skills. The second study ($N = 237$ children in 36 classrooms) addresses the joint contribution of (dyadic and classroom-level) teacher-student interactions and peer likeability for kindergartners' behavioral development. The third study ($N = 228$ peer rejected Grade 5 students from 45 classes) investigates the role of dyadic teacher behavior for changes in rejected students' peer likeability and academic achievement. Finally, a cross-lagged longitudinal study ($N = 444$ students followed from Grade 4 to 6) investigates the reciprocal relations between teacher-child and mother-child relationships and children's behavioral and motivational adjustment. An expert in child academic development and social interactions will reflect on these studies' implications.

How do teacher emotional and autonomy support relate to child language and self-regulation skills?

Presenting Author: Marina Lemos, University of Porto, Portugal; **Co-Author:** Joana Cadima, University of Porto, Portugal;

Co-Author: Tiago Ferreira, University of Porto, Portugal; **Co-Author:** Teresa Leal, University of Porto, Portugal; **Co-**

Author: Karine Verschueren, KU Leuven, Belgium

In this study, we examine the extent to which teacher emotional and organizational/autonomy support at dyadic and classroom levels predict language and self-regulation skills in preschool. Participants were 187 children (49% boys; $M = 4.95$ years) attending 43 preschool classrooms and their respective teachers. Children were assessed at the beginning of the year with a self-regulation and vocabulary measure. Classrooms were observed using the Classroom Assessment Scoring System and rated on the overall emotional and organizational support. Teachers reported on levels of dyadic teacher-child closeness and autonomy. At the end of the school year, children were assessed using direct measures to tap vocabulary and self-regulation skills. Multilevel analyses indicated that closeness at the dyadic level made a positive significant contribution to vocabulary, after controlling for initial levels of vocabulary. In addition, dyadic autonomy support positively predicted self-regulation skills, after controlling for initial levels of self-regulation. Moreover, moderating effects for boys and girls were found such that girls benefit the most from close relationships regarding vocabulary growth. No effects of classroom-level processes were found. The findings underscore the importance of dyadic close relationships for fostering vocabulary in preschool, while individual autonomy support may be additionally important to foster children's ability to regulate their own behaviors. Findings have important implications for understanding the role of dyadic and classroom social processes on the development of language and self-regulation skills.

Peer acceptance and teacher-child interactions: Relative contribution to kindergartners' development

Presenting Author: Tessa Weyns, KU Leuven, Belgium; **Co-Author:** Hilde Colpin, KU LEUVEN, Belgium; **Co-**

Author: Sarah Doumen, Universiteit Hasselt, Belgium; **Co-Author:** Karine Verschueren, KU Leuven, Belgium

The present longitudinal study examined the joint effects of peer acceptance and individual and class-level teacher-child interactions on the development of externalizing and internalizing behaviors in kindergarten. A sample of 237 children (49% boys, $M_{age} = 5.19$ years) from 36 classrooms was followed during three waves in kindergarten. Individual and class-level teacher-child interactions were observed, while peer ratings were used to assess peer acceptance, and teacher ratings to assess child behavior. Multilevel modelling showed that children who were better accepted by peers at the start of kindergarten had lower levels of externalizing and internalizing behavior over time. Children who had more negative individual interactions with their teachers displayed higher levels of externalizing behavior throughout kindergarten, and children whose teacher displayed more sensitive interactions at class-level had lower levels of internalizing problems over time. Our study has several implications for further research and practice. Regarding research, it provides strong evidence for the inclusion of both individual and class-level teacher-child interactions, given the different associations of these two levels, and for the importance of including several dimensions of teacher-child interactions in future research. Regarding practice, our study underscores the value of involving several social actors in the school context for improving behavioral development of children.

Teacher behavior with peer-rejected students: Associations with peer status and academic achievement

Presenting Author: Marloes Hendrickx, Utrecht University, Netherlands; **Co-Author:** Tim Mainhard, Utrecht University,

Netherlands; **Co-Author:** Henrike Boor-Klip, Radboud University, Netherlands

Rejection by peers puts students at risk for limited academic achievement. The present study first explored teacher behavior and then examined the role of teacher behavior in changes in peer liking status as well as academic achievement for 228 peer-rejected students ($M_{\text{age}} = 10.47$). Frequency and valence of teacher behavior were observed, peer rejection and liking rating were measured using peer reports, and academic achievement was measured using standardized tests. Results of multilevel analyses showed that peer-rejected students had lower scores on the standardized tests and received higher frequency and more negative valence of teacher behavior. More positive teacher behavior was associated with an increase in peer liking ratings over time, but not with changes in academic achievement. In sum, teacher behavior did result in improved peer evaluations but this improvement was not (yet) reflected in increased school performance.

Children's behavioral and motivational adjustment: Relationship with mothers and teachers

Presenting Author:Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Riitta-Leena Metsapelto, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:**Jari-Erik Nurmi, University of Jyväskylä, Finland

Previous research highlights the benefits of warm and supportive relationships with caring adults for child adjustment. The present study investigated the cross-lagged associations between children's behavioral adjustment, task-avoidant behaviors and relationship with mothers and teachers in a sample of 444 Finnish students. Teachers evaluated children's internalizing and externalizing problems, prosocial behavior and task-avoidant behavior at the end of Grades 4 and 6, and also reported closeness and conflict in their relationship with a particular child. In addition, mothers reported affection and negative affect with their child and also rated children on task-avoidant behaviors. The results of cross-lagged path models showed that the higher the children scored on externalizing problems at Grade 4, the more conflict teachers reported in relationships with them two years later. Children's task-avoidant behaviors and teacher-rated conflict were reciprocally associated. Prosocial behavior was negatively predicted by a previous level of teacher-rated conflict. Mothers' negative affect was related to increased task-avoidant behaviors. Boys' prosocial behavior positively predicted whereas their externalizing problems negatively predicted subsequent maternal affection. High maternal affection was negatively related to girls' subsequent internalizing problems. Implications for educational practice and future research are discussed.

Symposium

Learning and Special Education

Cognitive determinants and association between arithmetic and reading

Keywords: Cognitive skills, Learning and developmental difficulties, Learning disabilities, Literacy, Mathematics, Metacognition, Numeracy

Interest group: SIG 15 - Special Educational Needs

Chairperson: Mikko Aro, University of Jyväskylä, Finland

Discussant: Ann Dowker, University of Oxford, United Kingdom

Deficits in mathematical abilities place a heavy burden on an individual's well-being and represent major costs to a nation's economics. In many cases mathematical difficulties co-occur with reading difficulties. Comorbid difficulties have been suggested to be more resistant to early support and can lead to serious long-term consequences for later school achievement and narrowing of one's societal and occupational prospects in adult life. Despite the importance of understanding the nature and development of difficulties in mathematics and reading, knowledge on underlying factors and stability of association across time is limited.

Varying operationalizations of math and reading skills have been proposed as one factor complicating interpretation of the previous findings related to cognitive correlates of mathematics, mathematical difficulties and their comorbidity with reading difficulties. In the present symposium the focus is in arithmetic calculation covering basic addition, subtraction and multiplication. Reading skill is operationalized as fluency in word list, sentence or text reading tasks. All four presentations cover both domain-specific factors (number-specific processes such as numerical magnitude processing) and domain-general factors (i.e. metacognition, processing speed or working memory).

This symposium will shed light on unexplored question of stability of the covariance between reading and arithmetic across the grades and extend current understanding of which cognitive factors underlie individual differences in basic arithmetical skills and it's covariance/comorbidity with reading. This is important in order to provide a solid basis for designing scientifically validated diagnostic tests and remediation programs for children at risk

Domain specific and general cognitive correlates of arithmetic and it's covariance with reading

Presenting Author:Tuire Koponen, University of Jyväskylä, Finland; **Co-Author:**Jonna Salminen, University of Jyväskylä, Finland; **Co-Author:**Riikka Heikkilä, University of Jyväskylä, Finland; **Co-Author:**Mikko Aro, University of Jyväskylä, Finland

Understanding of the factors that underlie the development of fluency in arithmetic and it's covariance with reading fluency is limited. This study examined domain-specific and domain-general cognitive factors related to arithmetic fluency as well

as it's covariance with reading fluency at the end of the 1st Grade. Two hundred Finnish 7-year-old ($M = 92.7$ months, $SD = 3.5$ months) children were assessed in domains of number skills (verbal counting, number writing and number comparison), language skills (phonology, rapid naming and letter knowledge), memory (verbal short term memory and working memory) and processing speed. The relations between measures were modeled in a structural equation model (SEM) framework using the Mplus 7.4 program (Muthén & Muthén, 1988–2015). Of the skills assessed, verbal counting skill had strongest association with arithmetic as well as it's covariance with reading fluency. Also phonology, number comparison, working memory and processing speed were associated both with arithmetic fluency as well as it's covariance with reading. Moreover, number writing was related to arithmetic fluency but not it's covariance with reading fluency. This finding supports the view that the relation between verbal counting and the development of fluency in reading and arithmetic is not accounted by phonology, working memory or speed of processing, which have all been suggested as possible contributors for the cross- domain predictive power of verbal counting skill. **Keywords:** arithmetic fluency, reading fluency, cognitive skills, verbal counting

Concordance Between Reading and Arithmetic Skills: Stability and Change from Grade 1 to Grade 7

Presenting Author:Heidi Korpipää, University of Jyväskylä, Finland; **Co-Author:**Tuire Koponen, University of Jyväskylä, Finland; **Co-Author:**Mikko Aro, University of Jyväskylä, Finland; **Co-Author:**Kaisa Aunola, University of Jyväskylä, Finland; **Co-Author:**Asko Tolvanen, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Jari-Erik Nurmi, University of Jyväskylä, Finland

The present study aimed to examine the extent to which there is stability in the concordance between reading and arithmetic skills from Grade 1 to Grade 7. The reading and arithmetic skills of a total of 1,335 Finnish children were assessed at the end of Grade 1 and again at the end of Grade 7. Stability and change in this concordance of skills were also examined with respect to the following predictors: linguistic skills (phonological awareness, letter knowledge, rapid automatized naming (RAN)), basic number skills (counting), general cognitive abilities (working memory, nonverbal reasoning) and parental education level. All predictors except working memory and nonverbal reasoning were measured when the students were in kindergarten. The results showed that there was substantial stability in the concordance of reading and arithmetic skills from primary school (Grade 1) to secondary school (Grade 7). This stability was predicted by letter knowledge, RAN, counting, working memory, and nonverbal reasoning. Unstable, time-specific concordance in Grade 1 was predicted by reading and arithmetic pre-skills including phonological awareness, letter knowledge, and counting, whereas time-specific concordance in Grade 7 was predicted by parental education level and nonverbal reasoning.

Keywords: Reading, arithmetic, concordance, comorbidity, development

Learning from your mistakes:Associations between cognitive control, metacognition and arithmetic

Presenting Author:Elie Bellon, KU Leuven, Belgium; **Co-Author:**Wim Fias, University of Ghent, Belgium; **Co-Author:**Bert De Smedt, KU Leuven - University of Leuven, Belgium

We investigated the theoretically appealing, but empirically little explored association between cognitive control and arithmetic. As arithmetic facts are stored in an associative network, incorrect but competing answers have to be inhibited when retrieving the answer. Consequently, individual differences in cognitive control are expected to contribute to individual differences in arithmetic fact retrieval. An important factor that has been often neglected in theoretical models of cognitive control, but received a lot of attention in educational research, is metacognition (i.e., the ability to assess one's own cognitive knowledge). To the best of our knowledge, there are no studies that have investigated the joint roles of cognitive control and metacognition in children's arithmetic. Furthermore, their unique roles in addition to the well-known domain-specific determinant of arithmetic, numerical magnitude processing, remains unclear. We investigated this issue in 127 typically developing 2nd graders. Our data revealed that inhibition (an aspect of cognitive control), calibration of confidence (a measure of metacognition) and numerical magnitude processing were significantly related to addition and multiplication. Regression analyses revealed that calibration of confidence and numerical magnitude processing remained unique predictors of addition and multiplication, and that inhibition was a unique predictor of addition. These data stress the importance of children's calibration of confidence, which should be considered as an important variable in studies on children's arithmetic performance. From an educational point of view, children can be instructed to identify their own mistakes, which consequently will improve their arithmetic performance.

Cognitive correlates of dysfluency in arithmetic and reading

Presenting Author:Jonna Salminen, University of Jyväskylä, Finland; **Co-Author:**Tuire Koponen, University of Jyväskylä, Finland; **Co-Author:**Riikka Heikkilä, University of Jyväskylä, Finland; **Co-Author:**Mikko Aro, University of Jyväskylä, Finland

This study examined cognitive correlates related to dysfluency in calculation (MD) and reading (RD), and comorbid fluency problems (MDRD) with regard to arithmetical operation used in classification of problems (addition vs subtraction). The group of children with MD ($N = 21$ / $N = 18$), RD ($N = 18$), and MDRD ($N = 14$) were compared in terms of domain-specific (numeracy and language) and domain-general cognitive skills (working memory, short-term memory and processing

speed). Results showed expected differences between MD and RD groups in domain-specific skills. RD group was slower in naming objects and letters than MD, and MD group was weaker in number comparison than RD but only when subtraction was used in defining MD. When addition was used in defining MD single-deficit groups (MD and RD) were more similar and they differed only in letter naming, where MD group was faster. Several differences in domain-specific and domain-general skills were found between MD and MDRD as well as between RD and MDRD groups. In sum, the overlap and specificity of the cognitive skills in children with MD, RD, and MDRD should be examined in more detail with regard to arithmetical operation type defining MD in order to better take into account the individual cognitive profiles when developing tailored educational support.

Symposium

Cognitive Science

Multiple influences of language on number skills and mathematics achievement

Keywords: Achievement, Developmental processes, Early childhood education, Language (Foreign and second), Language (L1/Standard Language), Learning and developmental difficulties, Mathematics, Numeracy, Reading comprehension

Interest group:

Chairperson: Camilla Gilmore, Loughborough University, United Kingdom

Chairperson: Iro Xenidou-Dervou, Loughborough University, United Kingdom

Discussant: Bert Reynvoet, KU LEUVEN, Belgium

Both domain-specific (e.g. magnitude representations) and domain-general (e.g. executive function) cognitive skills play an important role in symbolic number processing skills and contribute to individual differences in mathematics learning and achievement. One important domain-general skill, which is receiving increased research interest in recent years, is language. In this symposium we will explore the role of language in symbolic number skills at multiple levels and in multiple populations. We will consider both the role of mathematical language skills in predicting individual differences in preschool (Paper 1) and school-aged (Paper 2) children's acquisition of early number skills. We will also explore whether the effects of language persist throughout development. Specifically, we will show the ways in which language differences continue to influence symbolic number processing by examining English-Chinese adult bilinguals (Paper 3) and Dutch-speaking, compared to English-speaking, adults (Paper 4). Using a variety of methodologies and across different populations, the papers in this symposium reveal that language is an important, and often overlooked, factor in understanding mathematical performance. Uncovering the role of language on symbolic number processing skills is important, not only to better understand the factors that contribute to individual differences in mathematics learning and achievement, but also because language influences can shed light on the nature of symbolic number representations and processing.

Risk Classification for Low Mathematics Performance in Preschool: The Role of Mathematical Language

Presenting Author:David Purpura, Purdue University, United States; **Co-Author:**Elizabeth Wehrspann, Purdue University, United States; **Co-Author:**Amy Napoli, Purdue University, United States; **Co-Author:**Sara Hart, Florida State University, United States

Early mathematics skills are a critical aspect of school readiness. Unfortunately, many children struggle to acquire these skills, and difficulties in mathematics appear early and persist. Theoretical and empirical evidence has pointed to deficits in domain-specific skills (e.g., non-symbolic mathematics skills) or domain-general skills (e.g., language and executive functioning) as being the underlying cause of mathematical difficulties (MLD). However, some researchers have suggested that there may be multiple factors either separately or jointly underlying MLD. In the current study, we assessed a sample of 114 three to five year old preschool children on a battery of domain-specific and domain-general factors in the fall and spring of their preschool year to identify time 1 (fall) factors associated with low performance in mathematics knowledge at time 2 (spring). We used classification and regression tree analyses, a strategy that uses step-wise partitioning to create subgroups from a larger sample using multiple predictors, to identify the factors that were the strongest classifiers of performance for younger and older preschool children. Results indicated that the most consistent classifier of low mathematics performance at time 2 was children's time 1 mathematical language skills. Further, distinct classifiers of low performance emerged for younger and older children. Time 1 executive functioning skills and print knowledge were common classifiers for younger preschool children and time 1 general vocabulary and mathematics knowledge were common classifiers for older preschool children. Ultimately, these findings suggest that MLD may be multifaceted and that risk classification may differ depending on children's age.

Reading and math abilities differentially predict math competencies in young children

Presenting Author:Jacob Paul, The University of Melbourne, Australia; **Co-Author:**Robert Reeve, University of Melbourne, United Kingdom

Children's emerging math abilities depend on different cognitive competencies (core number, executive function and language abilities). Given early math ability comprise different competencies, it is unclear whether the same set of cognitive

markers are important for all math skills. To examine this issue, we assessed 267 6-year-olds standardised math and reading competence tests, as well as visuo-spatial working memory and core number (dot enumeration, number comparison) abilities. We also assessed their number fact retrieval speed and ability to read number strings (e.g., “3407”) at 6, 7 and 8 years. Arguably, single digit number fact abilities and reading number string abilities are associated with different cognitive abilities. We suggest number fact speed would be more associated with general math ability, while reading number string abilities would be more associated with reading ability. It is also important to determine whether general vocabulary and math test jointly predict the two math abilities, independent from different number-specific and general cognitive markers. To investigate these possibilities, we used a random intercept cross-lagged panel model to identify the reciprocal influences of number-specific and general cognitive markers in predicting reading number strings and number fact fluency. Findings show dot enumeration and general math ability predicted number fact fluency; and vocabulary and general math ability predicted the ability to read number strings. Along with dot enumeration ability, it is evident the entering school math and reading tests have utility in differentially predicting different early math competencies.

Number Word Processing in English-Chinese Bilinguals

Presenting Author:Becky Wong, National Institute of Education, Singapore; **Co-Author:**Rebecca Bull, National Institute of Education, Singapore, Singapore

Symbolic number processing and transcoding is a foundational numerical ability used in daily life. Yet, the cognitive mechanism that underlies this ability remains under debate, as seen from the plethora of models in the field of numerical cognition. Using bilingual number words as a case in point, the present study examines the cognitive mechanism underlying the processing and transcoding of English and Chinese number words among bilingual adults who show a balanced profile of language dominance. Potential participants (N = 110) completed a pre-screening questionnaire to assess their language dominance. 22 of those identified as balanced bilinguals participated in the rest of the behavioural study. First, we investigated whether participants could intentionally employ a semantic route to process and transcode pure English (e.g., “five six”), pure Chinese (e.g., “ ”), and / or mixed (e.g., “five ”) number words. Next, we investigated whether the semantic system that supports bilingual number word processing and transcoding is sensitive to the notation in which the number words are presented in (i.e., notation dependent) or not (i.e., notation independent). Our results indicate that balanced bilinguals can intentionally employ a semantic route for processing and transcoding pure English, pure Chinese, and mixed notation number words. Additionally, in support of early models of numerical cognition (e.g., Dehaene & Cohen, 1995), our study is one of the first to find behavioural evidence that the semantic system which supports bilingual number word processing and transcoding is notation independent.

Language effects on adults’ number line processing: An eye-tracking study

Presenting Author:Iro Xenidou-Dervou, Loughborough University, United Kingdom; **Co-Author:**Lieven Verschaffel, K.U.Leuven, Belgium; **Co-Author:**Koen Luwel, KU Leuven, Belgium; **Co-Author:**Camilla Gilmore, Loughborough University, United Kingdom; **Co-Author:**Ernest Van Lieshout, VU University Amsterdam, Netherlands

Understanding the cognitive factors that influence the way we process numbers is important given how fundamental numeracy is for education and our everyday lives. To date, cross-linguistic research with children has shown that language is one of those factors. In adults, however, the role of language has been unclear. Number-naming systems vary significantly across languages. For example, in Dutch for two-digit numbers (above twenty), the unit is named first, followed by the decade (e.g., 52 is “tweeënvijftig”). This is known as the “inversion property” and studies with children have shown that it can overload their Working Memory (WM) and negatively affect their number processing skills. Our aim was to examine the effects of language on adults’ number line processing. We conducted an eye-tracking experiment with Dutch- and English-speaking adults asking them to estimate the position of two-digit numbers on a 0-100 number line under two conditions: with and without WM load. Contrary to our expectations, Dutch adults did not take more time to move their eyes to the number line when hearing two-digit number-names compared to the English participants. Both groups’ performance dropped in the WM load condition. But, in both conditions, Dutch-speaking adults’ first fixation on the number line was further away from the correct response compared to the English-speaking adults. Even though we intuitively expect that number names are fully automatized by adulthood, our findings suggest that WM and language can affect adults’ basic number line processing.

Mixing Methods for Advancing Higher Education Research

Keywords: Achievement, Communities of learners, Design based research, Developmental processes, Higher education, Mathematics, Mixed-method research, Pre-service teacher education, Qualitative methods, Quantitative methods, Student learning

Interest group: SIG 04 - Higher Education

Chairperson: Miriam Barnat, University of Hamburg, Germany

Discussant: Judith Schoonenboom, University of Vienna, Austria

Higher education research can serve to legitimise policy decisions. At the same time, the idea of evidence-informed policy and practice is highly debated, because of the complexity of teaching and learning (Biesta, 2010). Mixed Methods research may provide adequate information for political decisions as it draws a nuanced picture of the intricacies of education exceeding the limits of quantitative and qualitative approaches. For obtaining this added value the literature provides detailed methodological guidance for the general design of Mixed Methods studies (Teddle & Tashakkori, 2009). However, integrating results gained with different kinds of methods during the course of a particular research project still poses considerable challenges, for example creating meta-inferences. Focussing on the effects of educational interventions directed at students or educational developers, the presentations use - inherently mixed - network data (Presentation 1), integrate interview and survey data (Presentation 2 & 3), or combine all three kinds of data and the respective analyses (Presentation 4). The contributors present different solutions to the challenges of integrating the results. Hence, the symposium brings together a range of studies in order to discuss the potential and challenges of Mixed Methods for advancing higher education research.

Help seeking and friendship in learning community networks

Presenting Author: Jasperina Brouwer, University of Groningen, Netherlands; **Co-Author:** Andreas Flache, University of Groningen, Netherlands; **Co-Author:** Ellen Jansen, University of Groningen, Netherlands; **Co-Author:** Adriaan Hofman, University of Groningen, Netherlands; **Co-Author:** Christian Steglich, University of Groningen, Netherlands

Learning Communities (LCs) are a common example of small-scale teaching and are assumed to facilitate academic relationships and friendship among students. Derived from Tinto's interactionalistic model that academic and social relationships contribute to achievement, special attention is given to the antecedents of relationships building in the networks in LCs. The current study addresses the research question who do students ask for academic support and to what extent do LCs contribute to establishing academic support and friendship relationship? The sample consists of eight learning communities with 95 first-year students and answered two social network questions, respectively about help seeking and friendship. Longitudinal social network analysis, i.e., stochastic actor based modelling, shows that it is more likely that students ask their similar achieving friends and from the same sex for academic support and friendship. Compared to lower achieving students, higher achieving students ask their fellow students more for academic support but have also more friends. In the first semester they seek help in their learning community, but compared to the first semester, in the second semester it is more likely that they ask for academic help outside their learning community. We do not find a significant effect for LCs on the academic support relationships and friendships.

A Mixed Methods approach to evaluate the effectiveness of mathematics teacher education in Germany

Presenting Author: Nils Buchholtz, University of Oslo, Norway

In a longitudinal evaluation study at several German universities a.o. the acquisition and development of mathematical pedagogical content knowledge (MPCK) of future mathematics teachers was investigated (Buchholtz & Kaiser, 2013). The study is a German supplementary study of the international comparative TEDS-M 2008 study on the professional competence of future mathematics teachers (Tatto et al. 2012). On the one hand the development of the MPCK of future teachers from first-year cohorts of five universities was surveyed longitudinally using quantitative instruments relating to TEDS-M 2008. Additionally, it was examined in qualitative oriented interviews, what individual perceptions the future teachers have of courses on mathematics education. As a result, different systematic perceptions could be identified that could be assigned to the characteristics of university courses on mathematics education. Through the combination of data from the instrument-driven survey and from the interviews relationships between knowledge acquisition and perceptions could be described that indicate aspects of effective teacher education in courses on mathematics education. Hereby the future teachers' explanations provided an interpretation background for the development of their MPCK.

Combining methods to study the effects of first-year support on students' academic competence

Presenting Author: Elke Bosse, University of Hamburg, Germany; **Co-Author:** Miriam Barnat, University of Hamburg, Germany

For a comprehensive understanding of study success and the transition into higher education, research needs to gain insights into the complex interplay of individual and contextual factors (Heublein, 2014). While the existing research on individual factors (Richardson, Abraham, & Bond, 2012) allows testing hypothesis based on a quantitative approach, qualitative studies may serve to further explore the role of contextual factors. To combine both perspectives, mixed-methods research suggests creating meta-inferences, i.e. to integrate quantitative and qualitative data (Tashakkori & Teddle, 2009). Based on a study that investigates the effects of first-year support on the development of academic competence in German higher education, the paper demonstrates the benefits as well as the challenges of mixed-methods research. Combining a longitudinal student survey and interviews, the study confirms empirical findings in the field (e.g.,

the relevance of learning strategies) and complements them with insights into the role of support programmes (e.g., study skill workshops).

Using mixed methods to support educational design decisions in 'bad data' contexts

Presenting Author: Tobias Jenert, University of St.Gallen, Switzerland

Educational research is often conducted in practical contexts such as schools or higher education institutions and aims to contribute to the development of instructional designs or programmes. Consequently, there have been repeated attempts to methodologically integrate the design aspect into educational research leading to concepts such as design-based research. Ideally, design decisions are based on clear evidence, obtained through an analysis of data gathered from the intervention. In actual projects, however, design decisions often have to be taken based on data that is incomplete, ambiguous or not meeting established scientific quality standards. We illustrate and discuss examples of an actual design research project where design decisions had to be taken in such 'bad data' contexts. Examples include different mixed methods configurations that helped to increase the interpretability and practical significance of the data. We will discuss methodological variants of 'mixing' and triangulation such as combining quantitative and qualitative data or applying different analyses on a dataset. In addition, we discuss limitations regarding the consistency between data, design decisions, and resulting effects.

Symposium

Learning and Instructional Technology

Processing dynamic visuospatial information: influences of hand proximity and multi-touch gestures

Keywords: Cognitive skills, Comprehension of text and graphics, Computer-assisted learning, Experimental studies, Instructional design, Learning Technologies, Multimedia learning

Interest group: SIG 02 - Comprehension of Text and Graphics

Chairperson: Romy Brömme, Leibniz-Institut für Wissensmedien, Germany

Discussant: Paul Ginns, University of Sydney, Australia

Multi-touch devices like tablets are increasingly important in educational contexts. During multi-touch interaction, users' hands are inherently near to the displayed information. Prior research shows faster and more accurate reactions with hands near to static visuospatial stimuli than with far hands (Abrams, Weidler, & Suh, 2015). Brömme et al. and Brucker et al. investigated the relevance of this near hand effect when extracting complex visuospatial information from dynamic visualizations. With hands near to dynamic visualizations participants not only better accomplished an attentional monitoring task (Brömme et al.), but they were also superior in learning task-relevant information in two domains (Brucker et al.). For a perceptual domain, the latter effect only holds true for high-visuospatial-ability learners. Gauthier and Bétrancourt as well as Blanqui et al. investigated the near hand effect regarding direct interaction in 3D-object-rotation tasks via direct multi-touch gestures, mouse or keyboard interaction or in an automatic condition without control. Whereas Blanqui et al. showed that the automatic condition was worse during training compared to all conditions with control (multi-touch, mouse, keyboard), Gauthier and Bétrancourt found a moderating role of visuospatial abilities on training and task performance: Low-visuospatial-ability participants profited from keyboard interaction, whereas high-visuospatial-ability participants profited from mouse and multi-touch interaction. To conclude, there seems to be a near hand effect for attentional processing and learning of visuospatial information from dynamic visualizations, but a less convincing effect regarding direct interaction with virtual objects. Additionally, beneficial effects of hand proximity are more likely to occur for high-visuospatial-ability participants.

Hands on and action: Near-hand film presentation boosts attentional control on multi-touch devices

Presenting Author: Romy Brömme, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:** Birgit Brucker, Leibniz-Institut für Wissensmedien (IWM), Germany; **Co-Author:** Peter Gerjets, University of Tuebingen, Germany

Previous research revealed preferential attentional processing of static visuospatial objects near the hands that might be the result of enhanced perceptual-driven bottom-up or cognitive control-driven top-down processes. The current study investigated whether this hand proximity bias also applies to dynamic information, for example in films or animations. The Monkey Business illusion (Simons, 2010) was used to differentiate between bottom-up (detection of unexpected events) and top-down (accomplishment of a monitoring task) processes of attention. An enhanced task-relevant processing in the monitoring task was hypothesized, because of a fostered attentional (top-down) control when the film was presented near the hands. Participants watched the film once on a tablet PC by either touching the tablet at both sides (near hand) or laying their hands on their lap (far hand). As expected, the monitoring task was accomplished more often correctly when the film was presented near the hands. This result pattern indicates a stronger attentional control for task demands in dynamic multi-touch environments. Thus, training and instructional videos that afford a high amount of attentional resources should be touched directly to ensure a more effective processing and elaboration of the dynamic material.

Learning on multi-touch devices: Is directly touching dynamic visualizations helpful?

Presenting Author:Romy Brömme, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Birgit Brucker, Leibniz-Institut für Wissensmedien (IWM), Germany; **Co-Author:**Sarah-Christina Weber, Leibniz-Institut für Wissensmedien (IWM), Germany; **Co-Author:**Peter Gerjets, University of Tuebingen, Germany

There is strong evidence that visuospatial processing and also learning is fostered near the hands. This near-hand effect is particularly of interest during interacting with information on multi-touch devices, because on these devices usually the hands are used to interact with digital objects and thus, the hands are near to the displayed information. Two studies addressed the question whether the near-hand effect also occurs during interacting with dynamic visualizations in two domains (perceptual vs. conceptual). Participants interacted in the first experiment with videos (perceptual domain: human movements) and in the second experiment with animations (conceptual domain: biological processes) on a multi-touch monitor and were in both studies randomly assigned to one of two conditions (hand proximity: near vs. far). Participants either held their hands constantly at the dynamic visualizations during their whole playtime (near) or they placed their hands into their lap while they watched the dynamic visualization (far). Moreover, the visuospatial abilities of the participants were assessed as a potential moderator during learning with dynamic visualizations. Results showed a near-hand effect in both experiments: In the first experiment only participants with higher visuospatial abilities in the near hand condition showed better learning in terms of recognition performance, whereas in the second experiment participants in the near hand condition generally showed better learning in terms of decomposition performance. These findings give first evidence that the near-hand effect also occurs for perceptual and conceptual learning from dynamic visualizations.

Impact of visuospatial abilities and interaction device in learning to manipulate 3D virtual objects

Presenting Author:Mireille Betrancourt, University of Geneva, Switzerland; **Co-Author:**Damien Gauthier, University of Geneva, Switzerland

Many disciplinary domains involve the understanding and manipulation of computerized 3D objects that can be tough to acquire for some students. An experimental study was conducted to investigate whether the type of interaction modality (keyboard, mouse and touchscreen) had an impact on learning to perform manipulation tasks on 3D virtual objects for participants with low or high visuospatial abilities (median split using the scores obtained to the Mental Rotation Test prior to the experiment). According to the literature, it was expected that touchscreen interaction, that involves meaningful gestures, would be the most effective and preferred mode of interaction, especially for participants with low visuospatial abilities. The participants (N = 36) learned to manipulate the 3D objects during a 10-trial training phase with one of the three interaction modalities. Then they performed the same manipulation task on 12 trials but without feedback, using the same modality as in the training phase. Regarding performance in accuracy during training, there was no effect of interaction modality or visuospatial abilities. However, a significant interaction between the two factors was found, with participants with low visuospatial abilities achieving the best accuracy using the keyboard and participants with high visuospatial abilities achieving higher performance with mouse and touchscreen. The same interaction pattern was found in the test phase. Interestingly, the participants, though they used only one interaction modality in this experiment, massively expressed preference for the touchscreen.

Influence of MultiTouch gestures on the 3D rotation of a figure in an embodied cognition approach

Presenting Author:Didier Blanqui, University of Toulouse, France; **Co-Author:**Franck Amadieu, University of Toulouse, France; **Co-Author:**Claudette Mariné, University of Toulouse, CLLE, France; **Co-Author:**Mireille Betrancourt, University of Geneva, Switzerland

The aim of this study was to investigate the effect of MultiTouch gestures on strategies and performance in a visuospatial task. The task was adapted from Shepard and Metzler's (1971) mental rotation task and consisted in judging whether two 3D virtual objects presented in different positions in space were the same or different. Four conditions were compared depending on the type of interaction implemented to rotate the object: keyboard, mouse, MultiTouch interaction or automatic rotation (no user control). Regarding MultiTouch interaction, a congruent gesture, similar to a real rotation gesture, was developed for rotating the object along one axis. Following an embodied cognition approach, we assumed that training with user control conditions should be more effective to the development of visuospatial abilities. In addition, MultiTouch interaction should favour perceptive strategies (visual alignment of the objects) due to the congruent gesture while the other modes should more promote mental rotation strategies. The Vandenberg and Kuse's mental rotation test was administered before and after the training. During training, automatic rotation lead to lower performance and more mental rotation strategies than the three conditions with user control. However, there was no difference between the three types of interactions with user control.

Symposium

Cognitive Science, Learning and Instructional Technology

Trajectories towards adaptive expertise: connecting school mathematics and out-of-school experiences

Keywords: Cognitive development, Cognitive skills, Computer-assisted learning, Developmental processes, Mathematics, Numeracy

Interest group:

Chairperson: Erno Lehtinen, University of Turku, Finland

Organiser: Erno Lehtinen, University of Turku, Finland

Discussant: Camilla Björklund, University of Gothenburg, Sweden

Studies of the use of mathematical knowledge in the rapidly changing working life refer to the importance of the ability to deal with mathematics in novel, conceptually demanding, and partly messy situations. This emphasizes that people should develop capabilities to use their mathematical skills in a highly adaptive and flexible way in novel situations in which the salient mathematical aspects are not explicitly apparent. Mathematical skills needed in changing work environments will not be developed through traditional classroom teaching alone, as the nature of the needed mathematical skills is changing. Many researchers have presented that this type of flexible and innovative use of mathematical knowledge, typical for professional mathematicians, should be an important aim also for school learning. In this symposium we focus on the trajectories of the adaptive use of mathematical skills in school learning and summarize findings of studies in which non-conventional methods are used in order to overcome the limitations of traditional school mathematics. First paper presents evidence of a broader form of arithmetic problem solving skills, which takes into account students' abilities to apply multiple procedures in an adaptivity way. Next paper report on an effective means to enhance adaptivity with arithmetic through a computer game. Third paper provides evidence of the possibilities to enhance students' reflectiveness in modeling word problems through humor. Finally the last paper provides an overview of a research line which examines how to extend mathematical education outside the normal bounds of the classroom.

Developing calculation flexibility in multi-digit division – a latent transition analysis

Presenting Author: Andreas Schulz, Zurich University of Teacher Education, Switzerland; **Co-Author:** Timo Leuders, University of Education Freiburg, Germany

The aim of this study is to shed light on learning trajectories within the development of calculation flexibility in multi-digit division. During an intervention, 209 fourth graders first discovered, then compared and practiced division strategies. Latent classes and transition probabilities concerning the use of distinguishable strategies were identified. Furthermore, students' abilities in reasoning about number relations were assessed. It was shown that students with lower reasoning abilities had only a slim chance of developing flexibility, whereas students with higher reasoning abilities had a substantial chance. In particular, children's abilities in the pretest in using $10 \times N$ patterns alone do not facilitate the further development of flexibility. However, abilities in using the split and add strategy appear to be an important stepping stone towards the flexible use of more advanced shortcut strategies and for the development of flexibility in multi-digit division.

The Effects of the Number Navigation Game on the Development of Adaptive Number Knowledge

Presenting Author: Boglarka Brezovszky, University of Turku, Finland; **Co-Author:** Jake McMullen, University of Turku, Finland; **Co-Author:** Minna M Hannula-Sormunen, University of Turku, Finland

It is suggested that in order to develop adaptive expertise with arithmetic problem solving, instruction should place more focus on practice with different combinations of numbers and operations. This practice should enhance students' adaptive number knowledge, described as students' recognition and flexible and adaptive use of different numerical characteristics and relations during problem solving. The aim of this study was to examine the effects of the Number Navigation Game (NNG), a game-based learning environment in the enhancement of elementary school students' adaptive number knowledge and general arithmetic skills such as arithmetic fluency and pre-algebra knowledge. Participants of the study were 1168 four, five and sixth grade students. Classes were randomly assigned to experimental ($n = 642$) and control ($n = 526$) groups. The experimental group played Number Navigation for ten weeks while the control group participated in regular mathematics instruction. Both groups completed paper-pencil pre- and post-tests of adaptive number knowledge, arithmetic fluency and pre-algebra knowledge. Results show that the experimental group improved more than the control group on all the measured mathematical learning outcomes. Results also showed a variation in the effectiveness of the intervention across different skills in the three grade levels. These results are in line with previous research, showing small general but stronger specific effects when looking at sub-groups, suggesting that focus should rather be placed on exploring more specific questions regarding the effectiveness of game-based interventions.

Is it real, or a joke? Realistic considerations to word problems in a test versus a humor setting

Presenting Author: Wim Van Dooren, KU Leuven, Belgium; **Co-Author:** Lieven Verschaffel, Katholieke Universiteit Leuven, Belgium

Research has shown that learners have a strong tendency to exclude real world considerations when solving word problems. In this study, we investigated whether children would adapt their behavior when solving word problems in which realistic considerations are required (P-items) when these problems are embedded in a humoristic context as compared to when they are offered a typical word problem solving context. 148 sixth graders solved four P-items in a humor condition versus in a word problem condition. It was found that significantly more realistic responses were given in the humor condition than the word problem condition, and this was the case for 3 of the 4 administered problems. Suggestions for further research and potential implications for classroom instruction will be discussed.

Approaching basic mathematics in a non-conventional way

Presenting Author:Erno Lehtinen, University of Turku, Finland; **Co-Author:**Minna M Hannula-Sormunen, University of Turku, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland; **Co-Author:**Nonmanut Pongsakdi, University of Turku, Finland; **Co-Author:**Boglarka Brezovszky, University of Turku, Finland

The standard way to teach school mathematics is not providing citizens with the adaptive and flexible mathematics literacy needed in future society and working life. We have conducted a series of studies in which children and school pupils approach mathematical skills in a non-conventional way. In the first study, small children in day care used a tablet game (Fingu) to deal with number pattern and then the same figures and number combinations (adapted from the game) were connected to their regular everyday activities. In the second study, mathematics training was integrated with a strategic computer game environment in which there were no ready-made mathematics tasks but students had to create and solve their own tasks in order to conduct arithmetic operations needed to progress in the game. In the third study teachers were trained to deal with word problems differently. First complex word problems were solved in small groups and after that students were asked to think about exciting experiences they have had and then model them as mathematical word problems. All conditions resulted in slightly better achievement in standard mathematics tasks than conventional mathematics education but in addition triggered spontaneous focusing on mathematically relevant features of the environment and more flexible ways to use mathematical skills.

Session A 22

29 August 2017 13:15 - 14:45

Symposium

Learning and Social Interaction

Socio-cognitive conflict and learning: the role of regulation, argumentation and motivation

Keywords: Argumentation, Cognitive development, Conceptual change, Conversation / Discourse analysis, Motivation, Quantitative methods, Reasoning, Social aspects of learning and teaching, Social interaction, Technology, Writing / Literacy

Interest group: SIG 03 - Conceptual Change, SIG 10 - Social Interaction in Learning and Instruction, SIG 26 - Argumentation, Dialogue and Reasoning

Chairperson: Baruch Schwarz, Hebrew University of Jerusalem, Israel

Discussant: Anne-Nelly Perret-Clermont, University of Neuchâtel, Switzerland

Cognitive conflict has been one of the most central mechanism of the Piagetian theory of human development. Doise, Mugny and Perret-Clermont (1975), extended this notion to socio-cognitive conflict. Whereas the solitary individual might be biased towards confirmation and therefore ignore negative feedback originating in the inanimate world or else information having a cultural origin, according to socio-cognitive conflict theory, the discovery of novelty, the intrigue of 'otherness', the social pressure and emotionally heightened experience of disagreement with another person would increase the probability that subjects would try to resolve their internal conflicts of viewpoints and thereby progress in cognitive terms. Socio-cognitive conflict was progressively transformed from a mechanism of development to a setting. Researchers began to understand the processes by which the resolution of conflicts between students engaged in social interaction could lead to learning. Among these processes, conflict resolution has been shown to depend on modes of argumentation (Schwarz & Baker, 2016). This symposium presents recent advancements on the role of argumentation in the resolution of socio-cognitive conflicts of students engaging in learning tasks. Other factors such as motivation and social regulation will also be presented. Finally, research on the role of technologies in stressing conflict during argumentation will be presented.

The regulation of sociocognitive conflict: Consequences for learning and interpersonal relations

Presenting Author:Fabrizio Butera, University of Lausanne, Switzerland

I will first present the early research that led to develop the theory of socio-cognitive conflict, which argues that dissent with one or several partners over a task in which learning is concerned may stimulate task-related cognitive activity and result in progress. Then, I will report research showing that socio-cognitive conflict is beneficial for learning to the extent that conflict is regulated in an epistemic manner; that is, by focusing on the task or on the knowledge at hand. On the contrary, socio-cognitive conflict can result in detrimental effects whenever conflict is regulated in a relational manner, that is, by focusing on status and on interpersonal dominance. Finally, I will move to more recent research addressing the question of the motivational determinants of various forms of conflict regulation. I will conclude on the interest of studying the specific forms of conflict regulation for teaching at school and at university.

The role of argumentative discourse goals in mitigating my-side bias in the writing of arguments

Presenting Author:Mark Felton, San Jose State University, United States; **Co-Author:**Amanda Crowell, Hunter College, City University of New York, United States

Research has shown that novice writers tend to ignore opposing viewpoints when framing and developing arguments in writing, a phenomenon commonly referred to as my-side bias. In a recent study, we tested whether manipulating argumentative discourse goals in a dialogue that occurred prior to writing would mitigate my-side bias. We found that

consensus-seeking argument with a disagreeing partner was more effective in mitigating my-side bias than persuasion-seeking argument. Here, in Study 1, we revisit the dialogue data from this previous study to explore how differences in the two argumentative discourse conditions might explain their differential effects on my-side bias. In study 2, we ask whether similar differences in argumentative discourse can be found when we test the same manipulation in discourse goals (persuasion vs. consensus) with expert arguers. The educational implications of both studies are discussed.

Socio-cognitive conflict and conceptual change: Unrealistic hopes and suggestions for improvement

Presenting Author:Christa Asterhan, Hebrew University of Jerusalem, Israel

Conceptual change involves both an improved capability to construct the correct scientific explanation, as well as more efficient inhibition and overriding of automatically activated, but irrelevant schemas and propositions. Instructional strategies for conceptual change should then support both, by providing students with opportunities to detect and understand the errors in (their) naïve theories *and* to fully comprehend the scientifically accepted theory. However, traditional show-and-tell instruction only focuses on the latter, whereas traditional socio-cognitive conflict research mainly focuses on making students aware of differences. Collaborative argumentation with a disagreeing peer is an activity that, in potential, combines both and can therefore be very powerful. However, this potential is often not realized. In this presentation, I present evidence from recent studies that suggest that students need additional instructional supports that (a) make them aware of the conceptual differences between solutions, and (b) make the correct full explanation more salient and accessible.

Supporting socio-cognitive conflict awareness in SNS discussions groups: A social network analysis

Presenting Author:Dimitra Tsovaltzi, Saarland University, Germany; **Co-Author:**Nikita Dutta, Saarland University, Germany; **Co-Author:**Thomas Puhl, Saarland University, Germany; **Co-Author:**Armin Weinberger, Saarland University, Germany

Socially embedded large-scale forms of communication, like SNS (social networking sites) provide a rich context of socio-cognitive interactions where conflict can arise. However, without support users may not be able to register this conflict appropriately, or they might not know how to deal with it in a productive way. This may lead to missed opportunities of individual and group-level learning. Supports for conflict awareness and for processes of argumentation to resolve the conflict in group discussions can leverage the richness of socio-cognitive interactions. This article presents a comparison of such supports in a university teacher-trainee course on communication theory that included weekly SNS discussions. Group Awareness Tools (GATs), were used to increase attitude conflict awareness. Argumentation scripts were used as a cognitive guidance to help learners capitalize on this awareness and resolve the conflict. We use Social Network Analysis (SNA) to analyze conversational data and data from a communication attitude questionnaire on group-level processes relevant to attitude change during argumentative SNS discussions: number of interactions, information flow control, influence distribution, and attitude similarity. Both GATs and argumentation scripts influence argumentation processes positively, but scripts influence even more processes.

Session A 23

29 August 2017 13:15 - 14:45

Pinni B - B4113

Symposium

Motivational, Social and Affective Processes, Teaching and Teacher Education

Professional development of student teachers during their field experiences

Keywords: Attitudes and beliefs, Cooperative / collaborative learning, Design based research, Developmental processes, Higher education, Knowledge creation, Motivation and emotion, Pre-service teacher education, Qualitative methods, Quantitative methods, Student learning

Interest group: SIG 08 - Motivation and Emotion, SIG 11 - Teaching and Teacher Education, SIG 14 - Learning and Professional Development

Chairperson: Dagmar Festner, University of Paderborn, Germany

Discussant: Margje W.J. van de Wiel, Maastricht University, Netherlands

In teacher education there is an ongoing debate how much practice is necessary and appropriate to prepare teacher students in the best way for their future workplace. In some European countries such as in Germany increasingly long-term internships are implemented with the aim to interrelate theoretical knowledge teacher students already have with their gathered practice experiences. But as empirical evidence for the effectiveness of internships and probable influencing factors is scarce, especially long-term internship are still on trial (Arnold, Gröschner, & Hascher, 2014). The aim of the symposium is to bring together different perspectives on the professional development of teacher students: Whereas two contributions focus on changes of learning-to-teach patterns and educational knowledge during long-term internship, another paper highlights the experience and change of emotions as an important element during student teaching. In addition, the fourth contribution amplifies the concept of deliberate practice as one possible way of fostering professional development of student teachers.

References Arnold, K.-H., Gröschner, A. & Hascher, T. (Eds.) (2014). *Pedagogical field experiences in teacher education: Theoretical foundations, programmes, processes, and effects*. Münster: Waxmann.

Changes in learning-to-teach patterns of student teachers during long-term internships

Presenting Author:Dagmar Festner, University of Paderborn, Germany; **Co-Author:**Alexander Groeschner, Friedrich Schiller University Jena, Germany

Teacher education should be aimed at developing students' learning-to-teach patterns from an *inactive/survival* or *reproduction oriented learning pattern* to an *(in)dependent meaning oriented learning pattern*. Although the change in the direction of *independent meaning oriented learning pattern* is desirable, previous studies provide evidence that changes in learning-to-teach patterns are mutable in all directions. To gain deeper insight into the reasons for these changes, the focus of the present study is the comparison of two groups of student teachers, who change their learning-to-teach pattern during a five months internship in an (un)desired direction. In the study $N=182$ student teachers in the second semester of the teacher education master program filled in an online-questionnaire at the beginning (t_1) and at the end (t_2) of their five months internship. The findings show that students are more likely to change their patterns towards independent meaning oriented a) if they perceive the behavior of mentors in a positive way, b) if they feel in a larger extend satisfied with (less) strain and c) if they are convinced that they achieved the targets within the internship. Furthermore, we found an increase of self-estimated competence in both groups. But the group which changed patterns in a desired direction d) rated their competence at the beginning of the internship lower and at the end higher compared to the group which changed in undesired direction.

The development of educational knowledge during long-term internships in teacher education

Presenting Author:Sarah Mertens, University of Wuppertal, Germany; **Co-Author:**Cornelia Graesel, Bergische Universität Wuppertal, Germany

One recently introduced and increasingly important element in German teacher education are extended periods of internships. These long-term internships are supposed to improve the professional teacher education. Overall, research addressing competence development during these longer internships in teacher education is still rare. Most of the current research focusses on self-assessment of competences on the one hand and objective tests on the other hand (for an overview see Besa & Büdcher, 2014). A combination of both ratings is rarely used. Additionally, most of the studies do not include control groups. The purpose of this study is to examine three kinds of competence measures to inspect if students with and without a long-term internship differ in their development of educational knowledge as one part of professional competence. Besides a self-assessment questionnaire (Gröschner, 2009), students had to answer an educational knowledge test (Seifert & Schaper, 2010), as well as a video-based tool to measure teachers' professional vision (Seidel & Stürmer, 2014). To examine the competence development, a 2x2 mixed design was used. Here, the group membership (internship group vs. control group) was chosen as between-subjects factor and the measurement point (pretest vs. posttest) as within-subjects factor. In the analysis the internship group has shown a significantly higher professional vision and competence self-assessment than the control group which did not pass the long-term internship. A significant development of the conceptual knowledge determined by the educational knowledge test could not be demonstrated for any of the two groups.

Emotions in cooperative field experiences

Presenting Author:Tina Hascher, University of Bern, Switzerland; **Co-Author:**Lea de Zordo, University of Bern, Switzerland; **Co-Author:**Gerda Hagenauer, University of Bern, Switzerland

Collaboration is an essential element of the teaching profession and a precondition of school development and school. One key learning opportunity for collaboration are internships in pre-service teacher education as they often take place in teams. Although there is some evidence that learning during internships can be fostered by collaborative settings such as student teacher teams and peer-coaching (Goodnough et al., 2009; Lu, 2010), little is known about the learning processes and outcomes. Even less is known about the emotional experiences of student teachers in collaborative internships. Our quantitative study with future preschool and primary school teachers ($N_{t1} = 205$; $N_{t2} = 132$) aimed at analysing cooperative student teaching from an emotional point of view: Which emotions do pre-service teacher experience regarding collaborative student teaching during internship? How are these emotions correlated to different forms of collaborative student teaching? Results showed that the emotional potential of collaborative internships is high: Emotions occur both before and during collaborative internships with a stress on positive emotions such as excitement, enthusiasm, and proud. However, student teachers also experience an array of negative emotions such as nervousness, irritation, and anger. Teaming models are the most frequent forms of team teaching right from the beginning of internships. There is no clear pattern regarding the correlation between emotions and team teaching forms.

Fostering student teachers' deliberate practice: a school-based educators' perspective

Presenting Author:Maaïke Endedijk, University of Twente, Netherlands; **Co-Author:**Larika Bronkhorst, Utrecht University, Netherlands

Deliberate practice, defined as prolonged engagement in practice that is purposefully designed to improve performance, even when a satisfactory level of performance has already been reached, is increasingly recognized as necessary for professional development across professions. Yet, exemplars of how to stimulate deliberate practice, particularly during teacher education, are limited. This paper sets out to explore how student teachers' deliberate practice can be promoted during a dual teacher education program, capitalizing on expert school-based educators' experience. Based on a thematic

analysis of in-depth interviews with thirteen school-based educators, locally recognized as experts, our results refine and elaborate on previously developed design principles. Findings stress the importance of working from explicated theories of practice, using pupils as sources of feedback, anticipatory reflection, creating powerful learning contexts in school, and keeping professional development, especially during teacher education, realistic. Using these design principles can complement existing supervision practices in teacher education, typically directed at (retrospective) reflection. The findings tie in with recent articles describing deliberate practice as necessary, but perhaps not sufficient for (student) teacher expertise development.

Cognitive Science

Effects of non-invasive brain stimulation on learning

Keywords: Achievement, Cognitive development, Cognitive skills, Language (L1/Standard Language), Learning and developmental difficulties, Learning disabilities, Learning Technologies, Mathematics, Neuroscience

Interest group: SIG 22 - Neuroscience and Education

Chairperson: Roland H. Grabner, University of Graz, Austria

Chairperson: Nienke van Atteveldt, VU University Amsterdam, Netherlands

Organiser: Roland H. Grabner, University of Graz, Austria

Organiser: Nienke van Atteveldt, VU University Amsterdam, Netherlands

Discussant: Martijn Meeter, VU University Amsterdam, Netherlands

In educational neuroscience, there is rapidly growing interest in non-invasive brain stimulation by means of transcranial electrical stimulation (tES). In tES, a small electrical current is applied through electrodes on the scalp, which can modulate the activation of cortical regions, and thereby, influence cognitive functions. The possibility to improve cognition through tES has great potential to be relevant for education, as it could be a future means to support skill acquisition in individuals with learning disabilities. In addition, tES could have a massive societal impact when used as cognitive enhancer in academic settings, raising ethical issues we need to deal with. The aims of the present symposium are (a) to provide an overview of the current evidence on tES effects on school-related learning and (b) to critically discuss the application of non-invasive brain stimulation in education. The four talks in this symposium focus on tES effects on language processes, numerical cognition, and executive functions, their relevance for the treatment of learning disabilities (in particular dyslexia and dyscalculia), and the impact of tES on neurorehabilitation after stroke. In addition, ethical, legal and societal issues with the focus on the child's wellbeing are addressed that arise from the education-related use of tES. The discussant of the symposium will finally integrate the presented evidence against the background of a recent meta-analysis of tES effects on learning.

The effect of brain stimulation on learning when taking into account the neural correlate

Presenting Author: Roi Cohen Kadosh, University of Oxford, United Kingdom

Fluid cognitive skills, such as working memory, reasoning, and mathematics, are critical in most academic settings. Current attempts to improve cognitive skills in children and adults have yielded mixed results and limited evidence of transfer beyond the immediate cognitive training materials. These failures have led some to suggest that cognitive skills are fixed. Another suggestion is that these failures are due to suboptimal approaches to exploit neuroplasticity. An innovative method to modulate neuroplasticity is using brain stimulation, with the assumption that concurrent brain stimulation and cognitive intervention interact synergistically, enhancing the benefits derived from the intervention. The present experiments examined how progress in learning was related to the effect of brain stimulation at the neural level. The experiments will involve training on arithmetic learning or executive functions. The effect of brain stimulation was not beneficial in all the cases, but varied as a function of the neural system we tried to affect. The results lead to the idea that a consideration of the neurocognitive factors characterising the individuals in the experiment can lead to a much clearer understanding of effects than considering only the group they belong to. This approach yields advancement at the basic and translational level. It would enable the improvement and individualisation of interventions, and produce a better understanding of the underlying neurocognitive mechanisms.

Can Electrical Brain Stimulation (tES) Improve School-related Learning? A Meta-analysis

Presenting Author: Michael Schneider, University of Trier, Germany; **Co-Author:** Bianca Simonsmeier, University of Trier, Germany

The search for more effective learning techniques has been a quest of humanity since time immemorial. Recently, researchers have started evaluating whether stimulating the brain noninvasively with a weak and painless electrical current (transcranial Electrical Stimulation, tES) enhances physiological and cognitive processes. Some studies found that tES has weak but positive effects on brain physiology, cognition, or assessment performance, what has attracted massive public interest. Here, we present the first meta-analytic test of the hypothesis that tES before or during a learning phase is more

effective than tES before or during an assessment, because tES enhances learning through long-term potentiation. The meta-analysis included 246 effect sizes from studies on language or mathematical competence. As predicted, the effect of tES was much stronger for the stimulation during a learning phase ($d = 0.712$) as compared to the stimulation during an assessment phase ($d = 0.207$). The effect was stimulation-dosage specific and, in line with previous meta-analyses, significant only for anodal stimulation. The results provide evidence for the modulation of long-term synaptic plasticity by tES in the context of practically (e.g. school-) relevant learning tasks and highlights the need for more systematic evaluations of tES in educational settings.

tES of the auditory cortex to enhance basic acoustic processing abilities in dyslexia

Presenting Author: Tino Zaehle, Otto von Guericke University Magdeburg, Germany

Transcranial electrical stimulation (tES) has become a valuable research tool for the investigation of neurophysiological processes underlying human action, cognition and perception. In recent years tES has been also successfully applied to alter human auditory cortex reactivity, its related individual spectro-temporal processing abilities and acoustic speech perception (Heimrath et al., 2016a). These findings strongly implicate tES application as a therapeutic tool on auditory and speech-related disorders such as dyslexia. In this presentation I will give an overview over the spectrum from basic research on auditory tES in healthy populations through to pilot data on improved acoustic processing abilities in adults and adolescents with dyslexia.

tES for cognitive enhancement of healthy minors: A complex governance challenge

Presenting Author: Jantien Schuijjer, VU University Amsterdam, Netherlands

The use of cognitive enhancers for educational purposes has drawn increasing academic and public attention over the last years. Currently, pharmaceuticals are the most widely discussed enhancement method in the literature, but new evidence suggests that methods based on Transcranial Electric Stimulation (tES) have some potential as cognitive enhancer as well. Just like pharmaceutical enhancers, the availability and education-related use of tES-devices raises a broad range of ethical, legal and societal issues that need to be addressed by policy-makers. Few studies, however, have specifically studied these issues in relation to child wellbeing. In this systematic review, we explore the issues for child wellbeing that could arise from the availability and education-related use of tES-devices by healthy minors. We demonstrate that the issues form a complex web of expectations and concerns, which are incited by high levels of factual uncertainty and moral diversity. Little is known yet about the working mechanisms of tES and its (long-term) effect on healthy developing brains, and different perspectives towards virtues such as autonomy and authenticity lead to discussions on whether certain enhancement effects would be desirable, and whether potential risks would be acceptable. We argue for a responsible innovation approach, which encourages an adaptive attitude towards emerging knowledge and dynamic societal values, to deal with the identified issues regarding tES-based enhancement appropriately.

Invited Symposium

Learning and Instructional Technology

Measuring and supporting students' self-regulated learning in adaptive educational technologies

Keywords: Artificial intelligence, Educational Technology, Learning analytics, Learning Technologies, Metacognition, Motivation, Self-regulation

Interest group:

Chairperson: Inge Molenaar, Radboud University Nijmegen, Netherlands

Organiser: Roger Azevedo, North Carolina State University, United States

Organiser: Sanna Järvelä, University of Oulu, Finland

Organiser: Maria Bannert, Germany

Discussant: Dragan Gasevic, University of Edinburgh, United Kingdom

In this panel discussion, we will discuss the aim and current activities of the EARLI-Centre for Innovative Research (E-CIR) "Measuring and Supporting Student's Self-Regulated Learning in Adaptive Educational Technologies". The aim is to develop our understanding of multimodal data that unobtrusively capture cognitive, meta-cognitive, affective and motivational states of learners over time. Triangulation of multichannel data provides a fundamentally new approach, objective and subjective means, through which to capture critical phases of SRL and SSRL as they occur in learning situations. The goal of this panel is to discuss: a) How can we gather and analyze multimodal trace data using different channels (e.g., verbalization, physiology) to measure students' cognitive, metacognitive, emotions and motivation during learning? and b) How can these measurements be used to enhance current adaptive learning technologies supporting learners' self-regulated learning? Addressing these questions demands for a concerted interdisciplinary dialogue combining findings from psychology and educational sciences with advances in computer sciences and artificial intelligence. The participants in this E-CIR are leading international researchers who have articulated different emerging perspectives and methodologies to measure cognition, metacognition, motivation, and emotions during learning. The

participants recognize the need for intensive collaboration to accelerate progress with new interdisciplinary methods including learning analytics to develop more powerful adaptive educational technologies. During the panel current activities of the ECIR members will be shortly outlined after which the panel would like to go into discussion about this work with the audience.

Multimodal data to measure students' cognitive, metacognitive and motivation during learning

Presenting Author:Sanna Järvelä, University of Oulu, Finland

The members of this ECIR all collect different data channels to measure students' cognitive, metacognitive, emotions and motivation during learning. First, physiological data indicate students' bodily responses during learning. Examples are students' heart rate (IBI), Electro Dermal Activity (EDA), Blood Volume Pulse (BVP), and skin Temperature. Second, students' eye movements indicating what students are look at during learning. These data can be used to detect reading behavior, asses use of multimedia sources and tools in online learning environments. Additional, wearable eye trackers are used to assess students' interaction with physical objects and social interaction during learning. Moreover, students' pupil dilation can be used as indicator of students' effort and cognitive load. Thirdly, the students' face during learning can captured and used to analyze facial expressions. These are used to automatically detect the presence and intensity of expressions, such as happy, sad and angry. Finally, students clicking, typing and browsing behavior are captured in logs. During the panel, members of the ECIR will present the different data collected and the value of the different data streams to investigate students' cognitive, metacognitive, emotions and motivation during learning.

Combining and analyzing multimodal data

Presenting Author:Maria Bannert, Technical University of Munich (TUM), Germany

Bannert and colleagues are using process mining techniques to analyse verbal protocols collected during self-regulated learning. Especially, they are interested if instructional scaffolds affect not only the amount of different SRL activities but also the temporal structure and if so, whether the temporal structure of learning events corresponds with different dimensions of learning performance. Molenaar' s group studies time and order in self and socially regulated learning using single or multiple data streams. Recently, this group has begun to analyze logs of adaptive technologies to assess students' regulation of effort and learning over extended time periods. Azevedo and colleagues' research has focused on examining the role self-regulatory processes during learning with advanced learning technologies. More specifically, the overarching research goal has been to understand the complex interactions between humans and intelligent learning systems. Järvelä and colleagues have been exploring what multimodal data can tell us about SRL processes in authentic collaborative learning tasks. They have investigated how multichannel data can be used for identifying markers that characterize successful SRL and learning progress and help in understanding. Finally, Gašević and his colleagues have been working on analytical methods for the theory-informed study of self-regulated learning. Their work involves a broad range of methods for analysis of clickstream, discourse, and more recently psychophysiological data. The methods are based on unsupervised and supervised machine learning, sequence and process mining, automated text analysis, and social and epistemic network analysis. During the panel ECIR members will elaborate on their research results.

Challenges analyzing multimodal data

Presenting Author:Dragan Gasevic, University of Edinburgh, United Kingdom

Eventhough the multimodality trace data can enhance our understanding of students' processes during learning, we need to increase our methodological and theoretical understanding to properly analyse these data (Azevedo, 2014). This demands for a concerted interdisciplinary dialogue combining findings from psychology and educational sciences with advances in computer sciences and artificial intelligence. The participants in this E-CIR are leading international researchers who have articulated different emerging perspectives and methodologies to measure cognition, metacognition, motivation and emotions *during* learning. The participants recognize the need for intensive collaboration to accelerate progress with new interdisciplinary methods to overcome challenges of analyzing multimodal data. The combination of these insights is needed to accelerate progress with new interdisciplinary methods to understand how multiple data streams can support the measurement of SRL. During the pannel discussion different challenges of anylzing multimodal data will be adressed.

Applications of multimodal data for instructional decision making

Presenting Author:Roger Azevedo, North Carolina State University, United States

The goal of this ECIR is to develop measurements of students' cognition, metacognition, emotion and motivation *during* learning in order to support the development of more powerful adaptive educational technologies. Novel personalised support for learners to support self-regulated learning can be developed based on trace and multimodality data measures of students' states during learning. Moreover, tools can also be developed for teachers to enhance their instructional decision making and ability to support learners' individual needs in real-time, based on their multimodal multichannel data. Thus, we aim to make a significant contribution to the current debate about *how* learning analytics and multimodality data

can improve education. Panel members will present their ideas about application of the data.

Session A 26

29 August 2017 13:15 - 14:45

Main Building C - C7

Invited Symposium

Higher Education

What do we know about academic work today?

Keywords: Assessment methods and tools, Doctoral education, Mixed-method research, Neuroscience, Qualitative methods, Researcher education, Workplace learning, Writing / Literacy

Interest group: SIG 24 - Researcher Education and Careers

Chairperson: Kirsi Pyhältö, Finland

Discussant: Anna Sala-Bubaré, Ramon Llull University, Spain

This invited symposium addresses different aspects and recent changes of academic work and their implications for early career researcher education. The symposium brings together different perspectives on these two questions: what do we know about academic work today? And what are the implications of the empirical results for the preparation of early career researchers? The symposium bridges three communities of scholars who while sharing an interest in examining academic work rarely converse: those investigating a) workplace learning, b) academic communication, and c) pedagogies of research education. The invited symposium consists of four co-authored papers that draw on and represent our collective and extensive knowledge of the three fields in order to synthesize what is known, to make visible what has been overlooked, and to attend to implications for preparing early career researcher, in order to draw out future lines of research and to contribute to the researcher education. Each of the papers addresses a specific aspect of academic work in order to develop a future research agenda. The invited symposium displays a novel approach. We will suggest to those attending that they access a link to a suggested paper from each of the panelists to read before the session. In this way, we can have a more informed discussion about the issues in the plenary after the panelists have presented their studies.

Writing and Faculty Identity Development

Presenting Author: Montserrat Castelló, Ramon Llull University, Spain

This presentation focus on results from two recent studies aimed on understanding how faculty identity development is related to a differential use of teaching and research writing genres and whether this development follows different paths, on the basis of faculty perceptions regarding what they consider their main goal at university and their preferred sphere of activity (teaching or research). Participants ($N=67$) answered the online survey *Faculty identity and academic writing* focused on three dimensions: genres use (Likert scale), spheres of activity participation (multiple-choice) frequent activities performed in each of the spheres (open-ended). A mixed-method design combining quantitative and qualitative data analysis was used. Two non-consecutive steps of analysis were followed to establish a) the frequency of the genres used by faculty, the main goal at University and their preferred sphere of activity; b) whether they were significant differences between those variables (Mann-Whitney U). Qualitative data analysis implied a bottom-up content categorization analysis. Results showed that faculty's perceptions regarding their main goal at university (research) were not in alignment with their preferences (teaching). Writing genres used and activities reported closely mirror preferred spheres of activity and mismatch faculty's perceptions of their main goal at universities. This mismatch generate tensions and contradictions in the development of their professional identity that should be taken into account in institutional career development initiatives.

Forming academics in practice: acknowledging multiple trajectories and expectations

Presenting Author: Angela Brew, Macquarie University, Australia; **Co-Author:** David Boud, University of Technology Sydney/ Deakin University, Australia

What shapes academics? What influences their development, and how do they interpret feature of the environment in which they operate? A large-scale survey and interviews with academics in England and Australia focused on how academics interpret features of the university context as either encouraging or inhibiting their development demonstrates how they negotiate tensions arising from different discourses and experiences. This paper argues that academic career development needs to take account of artisanal academic work which lies between teaching and research. Academics' focus of attention and their modes of reflexivity vary and these affect how they respond in shaping their jobs. Career development takes place within work. There are mismatches between intended developments and how they are perceived on the ground. It suggests that changes in workplace practices may be more effective in career development than training courses.

Dynamics of Decision Making in Grant Panels

Presenting Author: Inge Van der weijden, Leiden University, Netherlands

External grants are ascribed a very high symbolic value in academia as they provide researchers with both financial and symbolic resources, consequently affecting career opportunities. However, difficulties arise in the process of panel

decision-making, when selection criteria need to be concrete and explicit to enable comparison. Having to choose between many applicants of similar quality makes the selection process liable to subjectivity, arbitrariness, and randomness. In addition, panel reviewing entails social interaction which suggests that group dynamics could influence the selection process. By interviewing scholars and adding insights from social psychology literature we identified factors affecting decisions in grant panels. Examples are panel composition, group norms, motivation, and information distribution. The outcomes of the study could be used to improve transparency, fairness and legitimation of talent selection processes.

The completion of an interdisciplinary PhD and the professional trajectories

Presenting Author:Karri Holley, University of Alabama, United States

Interest in interdisciplinary programs in STEM-related fields at the graduate-degree level is widespread across higher education. Such programs are seen as innovative, offering students, faculty, and future employers new ways to engage in the production and dissemination of knowledge. Using longitudinal qualitative interviews, this article considers the early career experiences of scholars who hold an interdisciplinary PhD in neuroscience. The scholars were interviewed first as doctoral students and then six years later. The initial and follow-up transcripts provided insight into individual decision making, external influences, and professional trajectory. The findings illustrate the challenges of marketability, professional development, and balancing personal and career demands for interdisciplinary PhD recipients in STEM-related fields.

Chairperson: Marion Reindl, University of Augsburg, Germany

A Meta-Analytic Review of Signaling Effects on Cognition and Learning

Keywords: Educational Psychology, Instructional design, Meta-analysis, Multimedia learning

Presenting Author:Maik Beege, Chemnitz University of Technology, Germany; **Co-Author:**Sascha Schneider, Chemnitz University of Technology, Germany; **Co-Author:**Steve Nebel, Chemnitz University of Technology, Germany; **Co-Author:**Günter Daniel Rey, Chemnitz University of Technology, Germany

The *signaling effect* states that learners profit from cues that highlight organization or relevant information. This meta-analysis includes 95 studies and $N = 11,499$ participants. One hundred thirty-one retention, 67 transfer performance and 23 cognitive load measures were used to determine separate mean effect sizes. Additionally, nine possible moderators (e.g., type of signaling) were identified. The retention ($g = .52$, 95% CI [.44, .60]) and transfer ($g = .31$, 95% CI [.22, .40]) sizes support the positive effect of signaling learning. Prior knowledge was identified as a moderator. Interestingly, cognitive load was not significantly affected by signaling ($g = .25$, 95% CI [-.04, .55]). The results were interpreted using media learning theories. General problems of aggregating cognitive load measures and recommendations for future studies are included herein.

Promoting digital wisdom through students' involvement in pedagogical design of an academic course

Keywords: Computer-assisted learning, Educational Technology, Higher education, Instructional design

Presenting Author:Tamar Shamir Inbal, Open University of Israel, Israel; **Co-Author:**Ina Blau, the Open University of Israel, Israel

Technological learning environments enable implementation of the constructivist approach, with learners actively involved in the construction and design of knowledge and learning processes through the use of educational technologies. This warrants a reconsideration of the instructional design in academia. This study examined how instructional design, based on listening to students' voice, transforms students into active co-partners in teaching and learning processes and how this concept influences the development of digital wisdom among students and lecturers. This case study analyzed 22 reflections of graduate students from an Israeli University. Qualitative analysis was carried out, indicating that students felt they were co-partners in the pedagogical course design, determining the content and shared digital activities. The expression of "students' voice" was exhibited in students' activities aimed to develop a sense of competence, personal strength and leadership skills, as well as in activities that required collaboration between members of the learning community, with students and lecturers having equal levels of participation. Such involvement contributed to students' digital wisdom and perceptions of the role of the lecturer as a leader in this process. This was accompanied by perceptions of technology as facilitating learning processes, improving flexibility, enabling greater accessibility, and supporting teacher-student communication.

Learning from videos: Effects of Subtitles, Complexity, and Language proficiency

Keywords: Comprehension of text and graphics, E-learning / Online learning, Educational Technology, Multimedia learning
Presenting Author:Tim van der Zee, Leiden University, Netherlands; **Co-Author:**Wilfried Admiraal, Leiden University, Netherlands; **Co-Author:**Fred Paas, Erasmus University Rotterdam/University of Wollongong, Netherlands; **Co-Author:**Nadira Saab, Leiden University, Netherlands; **Co-Author:**Bas Giesbers, Erasmus University Rotterdam, Netherlands

Open online education has become increasingly popular. In Massive Open Online Courses (MOOCs) videos are generally the most used method of teaching. While most MOOCs are offered in English, the global availability of these courses has attracted many non-native English speakers. To ensure not only the availability, but also the accessibility of open online education, courses should be designed to minimize detrimental effects of a language barrier, for example by providing subtitles. However, with many conflicting research findings it is unclear whether subtitles are beneficial or detrimental for learning from a video, and whether this depends on characteristics of the learner and the video. We hypothesized that the effect of 2nd language subtitles on learning outcomes depends on the language proficiency of the student, as well as the visual-textual information complexity of the video. This three-way interaction was tested in an experimental study. No main effect of subtitles was found, nor any interaction. However, the student's language proficiency and the complexity of the video do have a substantial impact on learning outcomes. These results question the generalizability of earlier findings which showed either a positive or negative effect of subtitles on learning.

Constructive Retrieval by Prompted Recall

Keywords: Instructional design, Learning analytics, Mixed-method research, Quantitative methods
Presenting Author:Tino Endres, University of Freiburg, Germany; **Co-Author:**Shana Carpenter, Iowa State University, Department of Psychology, United States; **Co-Author:**Alf Martin, University of Freiburg, Institute of Psychology, Germany; **Co-Author:**Alexander Renkl, University of Freiburg, Institute of Psychology, Germany

Retrieval fostering learning is a quite robust finding in memory research. When applying retrieval practice in educational settings the used task can be very different. Several studies have shown that memory can be enhanced using tasks that promote learners to link new learned contents to their prior knowledge. This pattern of results could also be used for retrieval practice. In this study we used simple retrieval tasks and enriched them with the requirement to link the retrieved contents to what learners already know. Fifty-six undergraduate students learned from a video-recorded lecture. Afterwards they were randomly assigned to either a free-recall condition, as used in many studies on learning by retrieval, or a prompted recall condition in which learners were required to recall the information and apply it to their lives. A one week delayed posttest comprised a fact recall and comprehension scores. Learners in the prompted recall group used more elaborative strategies in their answers. There was no significant difference between groups regarding the fact scores. The prompted recall group outperformed the free recall group on comprehension scores. The effect on comprehension was mediated by the use of elaborative strategies. This results underline the findings that retrieval is most effective when it involves constructive elaboration. This finding should encourage instructors to combine elaboration and retrieval in their learning environments.

Developing better educational videogames: optimising gameplay and difficulty within leaderboards

Keywords: Educational Psychology, Educational Technology, Experimental studies, Game-based learning
Presenting Author:Steve Nebel, Chemnitz University of Technology, Germany; **Co-Author:**Sascha Schneider, Chemnitz University of Technology, Germany; **Co-Author:**Maik Beege, Chemnitz University of Technology, Germany; **Co-Author:**Günter Daniel Rey, Chemnitz University of Technology, Germany

The inclusion of leaderboards is a frequently used mechanism within the process of gamification or within the method of game-based-learning. However, research regarding the underlying processes when including leaderboards within learning environments is still scarce. To address this gap, this study introduces competitive effort and perceived difficulty as central concepts for educational leaderboards. Furthermore, the connected gameplay mechanics are investigated. More specifically, penalties were included to influence the most successful learner behavior. The two facets were manipulated independently to investigate how leaderboards should be designed to support learning. Students played an educational

videogame especially designed for this research while being randomly assigned to a cell of a 2 (low vs. high difficulty) x 2 (with or without penalties) between-subjects design. Following, data on retention and detail knowledge, learning efficiencies and goal orientations were collected. Results revealed that participants with penalties scored higher on retention tests than participants without penalties. Additionally, detail knowledge is enhanced by a low difficulty in contrast to a high difficulty. Furthermore, students within the penalty condition were more outcome-efficient. An additional explorative analysis of goal orientations revealed several significant connections between individual dispositions and affective responses. In addition, several positive correlations with performance goals could be observed. Finally, with the impacts of gameplay characteristics and individual gameplay experiences, the connections of learning outcomes and individual traits highlight the significance of this study, the potential of educational videogames in general and the need for further research in the field.

Instruction after problem solving: Learning by elaborating on errors

Keywords: Educational Psychology, Experimental studies, Instructional design, Mathematics

Presenting Author:Katharina Loibl, University of Education Freiburg, Germany; **Co-Author:**Timo Leuders, University of Education Freiburg, Germany

Students, who engage in problem-solving activities targeting yet to-be-learned concepts, usually generate erroneous or incomplete solution attempts. These erroneous student solutions can form the basis for acquiring valid target concepts during subsequent instruction. Literature on conceptual change as well as studies on 'Productive Failure' and 'Inventing to prepare for future learning' indicate that elaborating on typical errors and comparing these erroneous solutions to canonical solutions may be crucial for learning in settings that set problem solving prior to instruction. In an experimental study with 200 students, we investigated the effect of elaborating on erroneous solutions when learning fractions by comparing three conditions: Students of all conditions first engaged in an identical problem-solving activity (problem-solving phase). Afterwards students worked on elaboration tasks that introduced canonical solutions (instruction phase). In this phase, students worked with a) only canonical solutions (control condition), b) canonical and typical erroneous solutions without prompts, c) canonical and typical erroneous solutions with prompts to compare these solutions. The comparison prompts aimed at focusing students' attention on relevant aspects. Results indicate that including erroneous solutions is beneficial for learning. However, only students who were prompted to compare the erroneous solutions to the canonical solutions significantly outperformed students in the control condition on posttest.

Developing a framework for the teaching of collaborative talk

Keywords: Peer interaction, Qualitative methods, Secondary education, Teaching / instruction

Presenting Author:Ruth Newman, University of Exeter, United Kingdom

ABSTRACTThis paper draws on the findings of an ESRC and British Telecom funded study which investigated the efficacy of an instructional intervention designed to support the development of collaborative talk in the secondary (L1) English classroom. The intervention adopted dialogic principles and, drawing on research in educational linguistics, emphasised the role of metatalk in developing students' awareness of the interpersonal processes of collaborative talk. Underpinning the 3-week intervention and informing subsequent data analysis, a framework was devised which described collaborative talk as a process of *participating, understanding and managing*. The intervention was implemented in two secondary schools: in one year 9 class (age 13-14) of 28 pupils and one year 10 class (age 14-15) of 32 pupils. For the duration, pupils were audio and video recorded in the same groups of 4, enabling a temporal investigation of their talk. 135 hours of video data was analysed systematically to examine the development of students' collaborative and meta-talk and the efficacy of instructional dialogue. Using transcript data, this paper will illustrate how the framework strands are enacted in students' collaborative talk. It will also show how the framework can be utilised as a pedagogical tool to support metatalk about collaborative talk processes, drawing attention to the role of metalinguistic understanding in talk development.

Pedagogical Usability Assessment of Digital and Non-digital Learning Objects

Keywords: Assessment methods and tools, Content analysis, Educational Technology, Instructional design

Presenting Author:Leonardo Madariaga, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Isabelle Burq, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Faustino Marañón, Pontificia Universidad Católica de Chile, Chile; **Co-Author:**Miguel Nussbaum, Pontificia Universidad Católica de Chile, Chile

Usability evaluation in education has been mostly devoted to the study of transactional artifacts such as websites, mobile and desktop applications, on-line learning systems, among others. Little attention has been given to evaluation of traditional information items provided to students like study guides, podcasts, demonstrations, step-by-step solutions and any other supporting materials. Furthermore, a considerable interaction between educators and students occurs in the process of usage of these conventional digital and non-digital learning objects. The Usability study of these items becomes a primary objective in terms of supporting their effective use, redesign or eventual process of discard. In this research, we developed a model in which Usability is not only an inquiry process directed from the information provider to the user, but rather a process of contrast between the Usability goals of the educator with the perceptions of the students. The first evaluation, deploys a contextualized Usability benchmark allowing the measurement of the possible Usability gap. We developed an on-line platform to assess the Usability of lecture materials provided to engineering students enrolled in a physics course in a Chilean university. The study involved 5 lecturers and 150 students. We observed that the model was able to respond to different types of study materials (conceptual through a podcast versus a problem solving paper guide). Analysis shows that the model clearly identifies the dimensions where the gap is present; this gap defines the redefinition of the learning

objects.

Teachers' insights on connected learning networks: Emerging activities and forms of participation

Keywords: Inquiry learning, Out-of-school learning, Qualitative methods, Social aspects of learning and teaching

Presenting Author:Henriikka Vartiainen, University of Eastern Finland, Finland; **Co-Author:**Saara Nissinen, University of Eastern Finland, Finland; **Co-Author:**Sinikka Pöllänen, University of Eastern Finland, Finland, Finland; **Co-Author:**Petteri Vanninen, University of Eastern Finland, Finland

The aim of this socioculturally informed study is to explore teachers' insights on connected learning activities and networks. An instructional approach based on design-oriented pedagogy (DOP) was carried out on a teachers' in-service project in Finland, which aimed to connect teachers, researchers, and experts to advance students' meaningful participation and inquiry activities around forest-related phenomena. An open-ended design task for the participating teachers and educators from kindergarten (N = 27), primary school (N = 2), and secondary school (N = 3) was to design, implement, and document a forest-related learning project with their own students or kindergarten children. In total, 11 learning projects were implemented with the support of the in-service project and shared in an OpenForest wiki environment. A deductive content analysis of openly published project presentations revealed that the teachers and educators working with children and youth of various ages all harnessed learners' interest as a basis for connecting with extended learning networks. Learners' interest and questions were cultivated by connecting with peers, family, external experts, and extended environments through diverse physical and digital information resources, tool-mediated activities, and by the externalization of evolving object-oriented ideas. In this study, the teachers' insights on emerged learning activities are bridged to form a more expanded notion of the extended participatory learning system.

Prerequisites of Primary School Students' Attitudes Towards Peers with Social or Emotional Disorders

Keywords: Attitudes and beliefs, Learning and developmental difficulties, Primary education, Teacher Effectiveness

Presenting Author:Marwin Felix Löper, Paderborn University, Germany; **Co-Author:**Frank Hellmich, Paderborn University, Germany

In the present study N=743 third and fourth grade primary school students' attitudes towards peers with emotional or social disorders and towards peers with learning disabilities were examined. The attitudes towards peers with special educational needs were assessed by using a short version of the "Chedoke-McMaster attitudes towards children with handicaps scale" (Bossaert & Petry, 2013). The results indicate neutral to slightly positive attitudes towards peers with special educational needs. In detail, primary school students' attitudes towards peers with emotional or social disorders are significantly less positive than towards peers with learning disabilities. Furthermore, the outcomes of a structural equation model in Mplus reveal that children's attitudes towards peers with social or emotional disorders can be explained by their perceived teacher behavior towards children with special educational needs, their contact experiences and their self-efficacy beliefs concerning their interpersonal skills. The effects of the perceived teacher behavior on children's attitudes towards peers with emotional or social disorders are mediated by their self-efficacy beliefs.

Scaffolding Mathematics Discussion vs Conventional Teacher Help in a Collaborative Setting

Keywords: Collaborative Learning, Mathematics, Secondary education, Teaching / instruction

Presenting Author:Sharon Calor, University of Amsterdam, Netherlands; **Co-Author:**Rijkje Dekker, University of Amsterdam, Netherlands; **Co-Author:**Jannet van Drie, University of Amsterdam, Netherlands; **Co-Author:**Bonne Zijlstra, University of Amsterdam, Netherlands; **Co-Author:**Monique Volman, University of Amsterdam, Netherlands

Scaffolding enhances learning outcomes. However, how teachers can scaffold small groups and how scaffolding of small groups affects mathematical learning, has not yet been investigated. We investigated whether scaffolding small heterogeneous student-groups at group level in a collaborative setting would have a greater effect on students' mathematical knowledge than conventional support. A quasi-experimental study (pre- and post-test) was conducted in four 7th grade classes. Participants were four teachers and 109 students working collaboratively in 28 small heterogeneous student-groups on the topic of Algebra. Two classes (14 groups) were scaffolded according to a Small-Group Scaffolding Model (SGS Model). The lessons were designed (in a previous study) with the specific aim to invoke mathematical discussions and raise the level of mathematical knowledge (Math Discussion Lessons). Results showed a larger difference

in mathematical knowledge gain for the Scaffolding condition. Interaction processes in four groups were analyzed. Analysis showed that approximately half of all group interactions in both conditions consisted of task-related utterances. One fifth of all group interaction in the Scaffolding condition existed of mathematical discussions and more mathematical discussions took place in the Scaffolding condition. Activities that are known to contribute to mathematical level raising took place relatively more in the Scaffolding condition. Scaffolding small heterogeneous student-groups at group level during Math Discussion Lessons in the 7th grade seems to result in more mathematical level raising and more mathematical discussions.

Nature as a Setting and Resource to Promote Learners' Agency and Competences in Education

Keywords: Competencies, Environmental education, Out-of-school learning, Primary education

Presenting Author:Marjaana Kangas, University of Lapland, Finland; **Co-Author:**Hanna Vuojärvi, University of Lapland, Finland; **Co-Author:**Pirkko Siklander, University of Lapland, Finland

Educational reform in Finland is concerned with how to shift school practices to foster students' agency and active participation. We investigated how nature, specifically a hiking course in Finnish wilderness, can enable students' agency and how it promotes their skills and competences. Agency is considered a social action that emerges in relation to associating with other people, including peers and teachers. Twenty-one eighth-grade upper secondary students and their two teachers participated in the research. All participants and a researcher hiked 35 kilometers during the hiking trip that lasted for three days, including two nights outdoors. Various qualitative research data were gathered: unstructured student and teacher interviews, audio-recorded field notes and photos, and the students' digital diaries. The focus of the analysis was on the descriptions and representations of activities that reflected agency, and the various competences needed for the learning activities. The findings indicate that the students' agency emerged as *accountability, resiliency, collectivity* and *success*. The students were responsible for their own and others' well-being; they were highly satisfied with the experience although the hiking activity was very tiring; they collectively contributed on common activities, which became evident in reciprocity and equality; and they felt a joint satisfaction and joy resulting from their success. In terms of competence areas, the hiking trip in nature enabled the students to exercise collaboratively skills for negotiation, problem-solving, and personal and social responsibility. Pedagogically, critical methods based on giving students freedom, ownership, and trust enabled a sense of agency for the students.

A Phenomenographic and Variation Theory Study of Lower Secondary Students' Personal Finance

Keywords: Attitudes and beliefs, Conceptual change, Phenomenography, Student learning

Presenting Author:Hua Loon Ling, The University of Hong Kong, Hong Kong

This study aimed to understand the financial education needs of ethnic minority (non-Chinese ethnicity) lower secondary students in Hong Kong. Improving the financial well-being of students has been recognised as an important endeavour. But beyond teaching knowledge and skills, it has been suggested that financial education should be focused on values and behaviours. Values can be understood as the evaluative and prescriptive beliefs wherewith individuals see the decision-making process and make judgments to guide behaviours. As discussed in phenomenographic theory, more powerful ways of seeing can lead to more powerful ways of acting. In this study, 99 Secondary 1 students (24 intervention group; 75 control group) from one secondary school in Hong Kong took part in a one-year longitudinal mixed-methods design study with three phases: baseline, intervention, and follow-up. At the baseline, all students completed a self-completion questionnaire with quantitative and qualitative components. The intervention group students were interviewed. Phenomenographic analysis was carried out on the qualitative data and findings of the critical aspects and features informed variation-theory design of financial education lessons that were taught to the intervention group students. Data was collected through student work, audio-recordings of class discussions, and interviews. At the follow-up phase, all students answered a similar questionnaire survey again. Findings were compared and contrasted between groups through quantitative statistical analysis of the phenomenographic outcome spaces and self-reported financial behaviours to evaluate effectiveness of the lessons to develop more powerful ways of seeing personal finance in the intervention group.

Describing the internal and external horizons: evidence from graduates' conceptions of price

Keywords: Conceptual change, Phenomenography, Teaching / instruction, Teaching approaches

Presenting Author: Guy Durden, University College London, United Kingdom

In Phenomenography/Variation Theory (PVT), most research has focused on identifying differences in conceptions of phenomenon *within* the internal horizon, without making explicit reference to the context, or external horizon (e.g. Pang & Marton 2003). The interaction between the external and internal horizons (Marton & Booth, 1997) could mean that this has limited the power of these research findings in applications to student learning. This study presents evidence of graduates' conceptions of the phenomenon of price in terms of a combination of aspects of the external and internal horizons. The study found that the external horizon was structured in terms of qualitative differences, in the same way as the internal horizon. These findings allow educators to more crisply delimit the context from the phenomenon, and to focus on a more clearly defined object of learning (Kullberg, Mårtensson & Runnesson, 2015). The importance of this is indicated in the study's findings that the external horizon has a powerful effect on revealed conceptions. The study raises questions about the nature of the relationship between aspects of the internal and external horizons in terms of the phenomenon of price, and the 'correct' way to sequence variation in order to trigger conceptual change.

The Accuracy of Teacher Expectations: Implications for Equal Educational Opportunities

Keywords: At-risk students, Attitudes and beliefs, Primary education, Social aspects of learning and teaching

Presenting Author: Christine Rubie-Davies, University of Auckland, New Zealand; **Co-Author:** Kane Meissel, University of Auckland, New Zealand

The accuracy of teacher expectations is important because when expectations are inaccurate, teachers plan inappropriate learning experiences for students; some are given challenging tasks and whereas others receive lower level assignments. In two samples, this study explored the accuracy of teacher expectations in a number of ways. First, whether expectations were accurate overall was examined. Second, whether some teachers were more accurate than others was explored. Third the accuracy of teacher expectations for different groups (ethnicity, SES and gender) was explored. Finally, whether teacher inaccuracy predicted end-of-year mathematics achievement was investigated. Only one-third of expectations for students were accurate and some teachers were more accurate than others. Ethnic minorities and those from low socioeconomic backgrounds were more likely to be underestimated. Teacher inaccuracy predicted end-of-year achievement such that those who were overestimated achieved at higher levels and the opposite. The educational and theoretical implications of the findings are discussed.

School Stress among Sixth-Grade Students – Associations with Academic Buoyancy and Temperament

Keywords: Attitudes and beliefs, Educational Psychology, Emotion and affect, Self-regulation

Presenting Author: Riikka Hirvonen, University of Jyväskylä, Finland; **Co-Author:** Laura Yli-Kivistö, University of Jyväskylä, Finland; **Co-Author:** Timo Ahonen, University of Jyväskylä, Finland; **Co-Author:** Noona Kiuru, University of Jyväskylä, Finland

The aim of the study was to examine to what extent sixth-grade students' academic buoyancy and temperamental effortful control and negative affectivity predict their experiences of school-related stress, after controlling for gender, GPA, and previous stress level. A total of 678 students (55% girls; mean age 12.3 years, SD = 0.33) participated in the study. The students rated their school-related stress in the fall and spring of the sixth grade. In the fall, they also rated their academic buoyancy and reported GPA from their most recent school report. Students' temperament was rated by their parent. A set of hierarchical regression analyses was conducted to examine the research questions. The findings showed that high academic buoyancy predicted low stress level after controlling for previous stress level, gender, and GPA. Moreover, high negative affectivity was related to a high level of stress after controlling for previous stress level, gender, and GPA. Effortful control and its interaction with negative affectivity did not predict students' stress. The findings suggest that interventions aiming at supporting students' academic buoyancy could also reduce their experiences of stress at school. Training of coping strategies and stress management techniques could be beneficial already among sixth-graders, especially among those with high negative affectivity.

When parents support students' choices: Parents' role in students' choice of a high school major

Keywords: Educational Psychology, Motivation, Parental involvement in learning, Motivation and emotion

Presenting Author: Idit Katz, Ben-Gurion University of the Negev, Israel; **Co-Author:** Moran Green-Cohen, Ben-Gurion

University of the Negev, Israel; **Co-Author:**Rinat Cohen, Ben Gurion University of the Negev, Israel; **Co-Author:**Suzi Morsiano-davidpur, Ben-Gurion University of the Negev, Israel

The goal of this longitudinal study is to examine how parents' involvement in the decision making process of choosing a high school major, is associated with the type of motivation, wellbeing and success of their children in studying the major. The study employs Self-Determination Theory as the theoretical framework for the investigation. Two hundred and twenty-nine 10th-grade students completed questionnaires at the very beginning and at the end of the school year. Through path analysis, the findings indicated that students' who perceived their parents as supportive during the process of choosing, chose a subject for autonomous rather than controlled reasons, had autonomous rather than controlled motivation to learn the subject, and had higher well-being, higher self-perception of ability and higher grades. The results highlight the positive role that parents can play in their children's choices in order to enhance autonomous motivation, wellbeing, and success.

Is Confusion leading to frustration or engagement? An emote-aloud study on achievement emotions

Keywords: Assessment methods and tools, Emotion and affect, Motivation and emotion, Multimedia learning

Presenting Author:Hannes Muenchow, University of Würzburg, Germany; **Co-Author:**Christoph Sonnenberg, University of Würzburg, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

Learning-related achievement emotions appear frequently and change dynamically while learning (e.g. D'Mello, 2013). According to the cognitive disequilibrium framework proposed by D'Mello and Graesser (2012), the learner's perceived confusion due to obstacles while learning can lead to feelings of eureka and engagement if the obstacle was overcome. Otherwise, the model assumes that ongoing confusion can enhance feelings of being frustrated or bored. The present study examines the model's assumptions by the help of process analyses. Because of difficulties in measuring emotional dynamics while learning sufficiently using retrospective questionnaires, an emote-aloud procedure in which learners had to verbalize emotional states during periods of learning was used (D'Mello, Craig, Sullins & Graesser, 2006). A total of N = 20 university students were asked to freely express changes of their emotional experiences during a 30-minute learning phase on 'probability theory'. As a guide, the participants were given a list of 13 learning-related emotional states that were derived from the literature. Other emotional states should also be verbalized. The statements were recorded and classified categorically (Cohen's kappa = .75). Descriptive results show that confusion (19%), boredom (15%) and frustration (15%), but also joy (11%) and Eureka (10%) were verbalized most frequently. Process mining analyses taking into consideration the sequential order of the verbalizations indicate important relations between confusion and eureka as well as frustration. These findings are in line with the cognitive disequilibrium framework. Additional analyses for conformance checking will be presented.

Developmental Interplay of Temperament and Motivation During the Early School Years

Keywords: Educational Psychology, Goal orientation, Motivation, Motivation and emotion

Presenting Author:Anna Rawlings, University of Helsinki, Finland; **Co-Author:**Anna Tapola, University of Helsinki, Finland; **Co-Author:**Markku Niemivirta, University of Oslo, Norway

As yet, little is known about the antecedents to inter-individual differences and change in students' goal orientations over the school years. While approach and avoidance temperaments are known to predict students' achievement goals, research into the effects of temperament on the development of goal tendencies remains sparse. This study examined the development and reciprocal predictions of temperamental reward and punishment sensitivities and achievement goal orientations, in a longitudinal framework over three years. Participants were students from 16 elementary-school classes (N = 286, 52.4% girls). In the spring of the 1st, 2nd, and 3rd grades, class teachers rated the students' reward and punishment sensitivities, and achievement goal orientations on four dimensions (mastery, performance-approach, performance-avoidance, avoidance). An autoregressive cross-lagged panel model was used to examine the development of the latent constructs and their reciprocal predictions over time. Findings showed relatively high stability over time for all constructs. Reciprocal negative predictions were found between reward sensitivity and mastery orientation, and positive between performance-approach orientation and reward sensitivity. Reward sensitivity in the first and second grades predicted performance-avoidance orientation in the following year. Avoidance and mastery orientations were found to have negative reciprocal predictions. Our findings provide new knowledge on the development of students' temperamental sensitivities and motivation, and how they may become linked already in the early school years.

The effect of classroom processes on reading comprehension: the mediating role of mastery goals

Keywords: Competencies, Goal orientation, Motivation, Teaching / instruction

Presenting Author:Desiree Theis, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Natalie Fischer, Universität Kassel, Germany

Transition to middle school is generally associated to decreases in student motivation and achievement. The stage-environment fit approach postulates that the maladaptive development of students in middle school is due to a misfit between students' basic needs for autonomy, social relatedness, and competence and the school context. Research confirms that classroom processes significantly affect students' achievement and motivation. The aim of this study is to investigate the association between perceived need fulfillment during German lessons, students' reading motivation (namely mastery goals) and performance. Moreover, we investigate whether the adoption of mastery goals mediates the effect of perceived quality of instruction on reading performance. 2.105 fifth grade students answered questionnaires about their mastery goals and the amount of perceived autonomy, competence and social support by the teacher as indicators of

quality of instruction in German lessons. Reading performance was assessed by a reading comprehension test. The association between perceived quality of instruction, students' mastery goals and reading performance was tested by latent regression analysis. Perceived need fulfilment was positively related to students' mastery goals. Mastery goals, perceived support by the teacher predicted higher values on the reading test. In terms of perceived autonomy and competence the effect on academic achievement was mediated by the students' mastery goals. Our findings underline the importance of the students' basic needs and their support and indicate that perceived classroom processes are mediated by the students' motivation.

On the path to dialogic teaching: Learnings from action research

Keywords: Action research, Reflection, Teacher Professional Development, Teaching / instruction

Presenting Author: Klara Sedova, Masaryk University, Czech Republic; **Co-Author:** Roman Švaříček, Masaryk University, Faculty of Arts, Czech Republic; **Co-Author:** Zuzana Šalamounová, Department of Educational Sciences, Faculty of Arts, Masaryk University, Czech Republic

The paper summarizes the results of an action research project focused on the implementation of dialogic teaching practice. The participants were eight Czech teachers in lower secondary schools who took part in a one-year intensive teacher development programme. *Dialogic teaching* is based on the thesis that spoken language should play a central role in teaching, since it provides an opportunity to influence students' thought processes through their involvement in classroom discourse. The participating teachers attended workshops centred on the indicators and principles of dialogic teaching. A series of nine video recordings of lessons were made for each participant, aimed at analysing whether any gradual change in classroom discourse may be identified. Video-stimulated reflective interviews were conducted in between individual lessons. An analysis of data from the video recordings revealed that the teachers and their classes underwent transformation towards dialogic teaching. At the same time, it showed that the process of change was non-linear. It included stages of regression and stages of progress. Data from reflective interviews demonstrate that these interviews played a key role in the process of change, since they became a vehicle for overcoming the regression and directing the change.

Pedagogy under pressure? Primary school teachers' perceptions of their pedagogical actions.

Keywords: Educational policy, Primary education, Teacher Professional Development, Teaching / instruction

Presenting Author: Michelle Gemmink, University of Groningen / Katholieke Pabo Zwolle, Netherlands; **Co-Author:** Marjon Fokkens-Bruinsma, University of Groningen, Netherlands; **Co-Author:** Jetje Pauw, Katholieke Pabo Zwolle, Netherlands; **Co-Author:** Klaas van Veen, University of Groningen, Netherlands

In Dutch primary schools, pedagogical actions seem to receive much less attention than content knowledge. This is the consequence of several developments and innovations that aimed at enhancing pupils' learning outcomes and at improving teachers' content knowledge and didactic actions. This results in a multitude of tasks and responsibilities for teachers around didactics and seems to constrain time and attention for pedagogical actions. This research explores whether the pedagogical actions of primary school teachers are indeed under pressure in the current educational climate. The goals of this study were threefold; (1) to examine teachers' perceptions regarding their pedagogical actions, (2) to examine how teaching experience, age of the students and the specific school context influence these perceptions, (3) to determine which needs for professionalisation teachers have to increase their pedagogical actions in the classroom. A survey was conducted among a sample of 261 Dutch mainstream primary education teachers in the northern part of the Netherlands. Data were collected with a questionnaire, which consisted of fifteen open and closed questions. Teachers were asked about their perceptions of pedagogical actions in the classroom, the school's vision of pedagogy, their personal vision of pedagogy and background variables of the respondents. Half of the responding teachers (47.5%) indicate that pedagogical actions of primary schools are under pressure. Over 60% of teachers indicated that they would like to pay more attention to this issue. Pedagogical actions of primary school teachers are indeed under pressure in the current educational climate.

Changing pedagogies and practices with digital storytelling: from teachers' perspective

Keywords: Educational policy, Educational Technology, In-service teacher education, Teacher Professional Development

Presenting Author: Marianna Vivitsou, University of Helsinki, Finland; **Co-Author:** Hannele Niemi, University of Helsinki, Finland; **Co-Author:** Veera Kallunki, University of Helsinki, Finland

This study aims to investigate four Finnish primary school teachers' views of how pedagogical and instructional practices change when digital storytelling is the teaching method. Digital storytelling is a new pedagogy aiming for student-driven knowledge creation by making and sharing online stories in video format. In order to meet this end, teachers need to introduce, support and facilitate student collaborative work in groups and/or pairs. In addition, they need to introduce the use of web-based environments, adapt their teaching plan accordingly, and enrich existing instructional material. As this process involves applying new ideas at work, making decisions on the ways of teaching, and developing own work, both the social and material aspects of teaching change (Biesta & Tedder 2007, Priestley et al. 2012). In addition, teacher professional agency also changes (Eteläpelto et al. 2015, Eteläpelto et al. 2013, Vähäsantanen et al. 2009). The focus of this study is to find out how teachers apply new pedagogies and how they expand the teaching plan and own practices in order to deal with the change. To analyze data resulting from teacher interviews we used qualitative methods. The analysis indicated three main categories in teacher definitions of change in their professional agency: contextualization of science-related learning; enabling collaborative work for knowledge building; and expanding available resources.

Making sense and enhancing teachers' collaborative expertise of school well-being

Keywords: Action research, Collaborative Learning, In-service teacher education, Teacher Professional Development

Presenting Author: Tuija Ukskoski, University of Jyväskylä, Finland

This action research examines an intervention aiming to develop teachers' expertise collaboratively. The context of the expertise is focused promoting educational well-being for preventing bullying. The intervention was implemented in two Finnish comprehensive schools, and as teachers' in-service training at workplace. Teachers (n=44) were informants, and the data has been gathered before, during, and at the end of the intervention. The intervention was based on integrative pedagogy. The themes of the training sessions constituted on the theories of well-being and bullying. Theoretical foundation lies here on the socio-cultural theories and studies of expertise, collaborative leadership and the sensemaking process. The mixed-method analysis was on the other hand a deductive, theory-based analysis, and on the other hand an abductive, thematic step-by-step analysis along the process of systematic coding. The process enhanced the collaborative expertise of well-being and revealed the main elements of this sensemaking process. Also, it generated new understanding about bullying from the perspective of the school personnel, and possibilities and limitations of promoting well-being. The research presents an example for organizing teachers' in-service training and novel practice in order to develop the school culture from the perspective of the organizational theory of collaborative leadership and sensemaking process.

Team learning and innovative work behaviour in vocational teacher teams

Keywords: Collaborative Learning, Social interaction, Vocational education, Workplace learning

Presenting Author: Andreas Widmann, University of Regensburg, Germany; **Co-Author:** Regina Mulder, University of Regensburg, Germany

In workplaces, innovations are required to address emerging problems and challenges. Also in vocational education there are many challenges in meeting the demands of students, of the labour market and society. In order to meet these demands, teacher teams need to work and learn together to develop innovative solutions such as products, processes and strategies. Research indicates that IWB can be fostered with individual learning processes, but insight in the relation between team learning processes and IWB is lacking. Team learning is defined as a compilation of processes that circularly generate changes for teams, team members or organizations. Inputs from multiple levels can influence team learning processes: structural and cultural work condition, which produce in turn team learning outputs at multiple levels. We examined the relations between team learning inputs, processes and IWB as behavioural output. We conducted a longitudinal survey study with three waves using questionnaires with 315 vocational teachers of 87 interdisciplinary work teams. The results indicate a positive relationship between team learning processes and IWB (ranging from T1: $r=.27$ to $.51$; T2: $r=.27$ to $.56$; T3: $r=.29$ to $.55$, p

Intergenerational relationships in elementary school teams. A social network approach

Keywords: Informal learning, Social aspects of learning and teaching, Teacher Professional Development, Workplace learning

Presenting Author: Kendra Geeraerts, University of Antwerp, Belgium; **Co-Author:** Jan Vanhoof, University of Antwerp,

Belgium; **Co-Author:**Piet Van den Bossche, University of Antwerp, Belgium; **Co-Author:**Nienke Moolenaar, University of Antwerp, Belgium

This paper examines the extent to which teachers' work-related social networks are affected by different generations of teachers. Data were gathered through a survey with socio-metric questions among 301 school team members in 15 elementary schools in the Netherlands ($n=301$). Using social network analysis, in particular p2 modelling, we analysed the effect of being part of a generation on teachers' probability of having relationships in networks such as discussing work, asking and providing advice, and collaboration. Findings indicate that generational cohorts based on chronological age do matter in the formation of work-related ties. These findings also support the importance of focusing on different instrumental networks since different age dynamics can be at play. Our findings also show that school team members of the youngest cohort tend to form intra-generational ties, whereas older generational cohort members form inter-generational ties.

Images of the possible: Leaders' effective interpersonal behaviours in difficult conversations

Keywords: Cognitive skills, Conversation / Discourse analysis, Qualitative methods, Teacher Professional Development

Presenting Author:Frauke Meyer, University of Auckland, New Zealand; **Co-Author:**Deidre Le Fevre, University of Auckland, New Zealand

Principals commonly struggle to have effective conversations about staff performance issues and parental complaints (Authors, 2011, 2014; Cardno, 2007; Yariv, 2009). They tend to tolerate and work around performance issues, sometimes even protecting staff members from further scrutiny, rather than effectively address issues (Bridges, 1992). Principals often avoid dealing with such difficult issues, because they lack the interpersonal skills to have effective conversations addressing these issues (Authors, 2011, 2014, Argyris & Schon, 1974). An earlier paper outlined a model of six specific values and skills that a group of 30 beginning principals struggled with when having effective conversations about performance issues. The model of 'Open-to-learning Conversations' was based on empirical evidence reported in studies of effective and ineffective negotiation, complaint interactions, interpersonal problem-solving and dilemma management. Questioned how exemplary practice in these values and skills would look like, we returned to the data to seek cases that exemplified effective practice. We drew on the analysis of 60 conversations based on two standardised scenarios in which a principal had to address a parental complaint about a teacher's performance or classroom management. Principals were rated on each of the six skills by means of five behavioural indicators which described a progression of effectiveness for each skill. This paper provides examples of principals' behaviour that exemplified the highest level of progression in the given skill. In describing these authentic examples along with key phrases we hope to provide guidance for practitioners themselves and those training and mentoring educational leaders in interpersonal effectiveness.

The role of physicians' experience in experiencing gut feelings in diagnosing ambiguous cases

Keywords: Problem solving, Professions and applied sciences, Reasoning, Workplace learning

Presenting Author:Margje W.J. van de Wiel, Maastricht University, Netherlands; **Co-Author:**Erik Stolper, Maastricht University, Netherlands

Medical expertise is the result of cognitive processes in which patient information and knowledge and experience of physicians interact. Gut feelings may arise from automatic, non-analytical processes and help physicians to navigate in complex and uncertain diagnostic situations. It is unknown in what way gut feelings develop with experience. The present expertise study shed light on this issue by comparing three groups of participants with different experience in general practice (16 experienced physicians, 16 trainees, and 16 clerks) while they diagnosed six patient cases. All cases were considered ambiguous, based on real patients, and elicited different types of gut feelings (sense of reassurance and/or sense of alarm). A clear expertise effect was found for elaborateness of case processing (i.e., clerks were more elaborate), but not for diagnostic accuracy and the gut feelings experienced. The cases were rather hard to diagnose and elicited different types of gut feelings for all participants. Case effects were strong while manipulations of patient information had minor effects and did not interact with participants' experience. This corroborates the case-specificity of knowledge in diagnostic reasoning. The study underscores that the interactions between the available patient information and the knowledge and experience of a physician determine the cognitive processes and outcomes. For training and continuous development this means that physicians must be made aware of their cognitive processes, act upon their uncertainty and sense of alarm, and need to seek feedback on their gut feelings in order to learn from their experiences.

Physiological synchrony during monitoring in collaborative learning

Keywords: Collaborative Learning, Metacognition, Mixed-method research, Self-regulation

Presenting Author: Márta Sobocinski, University of Oulu, Finland; **Co-Author:** Jonna Malmberg, University of Oulu, Finland; **Co-Author:** Sanna Järvelä, University of Oulu, Finland

Recent studies have focused on capturing processes of self- and socially shared regulation of learning in a contextualized manner, using novel methods and data sources. This study explores how different group members' cardiovascular signals synchronize during a collaborative learning, with a focus on monitoring activities. High school students worked face to face in groups of 3 during an advanced physics course. Video data and physiological data was collected from 6 lessons. The video data was analyzed using qualitative methods, and instances of monitoring were coded. Using the cardiovascular data, indexes of physiological synchrony were calculated. Physiological synchrony indexes are compared for instances of monitoring, and a timeline of the lessons is presented to contextualize when periods of strong physiological synchrony occur.

Teachers' awareness of students' misconceptions in astronomy. A qualitative analysis in Belgium

Keywords: Geography, Misconceptions, Secondary education, Teaching approaches

Presenting Author: An Steegen, KU Leuven, Belgium; **Co-Author:** Marjolein Cox, KU Leuven, Belgium; **Co-Author:** Mieke De Cock, KU Leuven, Belgium

Where previous studies have shown the existence of misconceptions in astronomy, this research focuses on the level of awareness that teachers have of these misconceptions and the possible strategies they use to change the students' mental models. Through focus group interviews with secondary school teachers and semi-structured interviews with teacher managers, this latent knowledge is made more explicit. The main findings suggest that the level of awareness about misconceptions varies considerably among the teachers. In general, the same pattern is found for the teacher managers. Some mental models, as for example the distance model, are known by all teachers whereas others models are not known at all. Even though teachers acknowledge the importance of students' preconceptions in general, they have difficulties using the students' prior knowledge in an effective way in their teaching practice. According to the teachers, this is mainly due to a lack of time and to difficulties experienced with differentiation. Awareness on misconceptions might therefore grow by organising different teacher training programs for preservice or inservice teachers, and by avoiding further misconceptions via a proper use of images in textbooks.

Designing videos for learning: Separating the good from the bad and the ugly

Keywords: Educational Technology, Experimental studies, Student learning, Multimedia learning

Presenting Author: Jason Lodge, The University of Melbourne, Australia; **Co-Author:** Jared Horvath, University of Melbourne, Australia; **Co-Author:** Alex Horton, University of Melbourne, Australia; **Co-Author:** Sven Venema, Griffith University, Australia; **Co-Author:** Gregor Kennedy, University of Melbourne, Australia; **Co-Author:** Shane Dawson, University of South Australia, Australia

Videos are increasingly being used in all levels of education. Despite this, much of what is thought of as best practice is based on heuristics over evidence from rigorous experimental or quasi-experimental studies. The two studies reported here are an attempt to provide further evidence about what video production methods (if any) actually influence student learning. In two large-scale experiments conducted online, overall video type (text, static image, image and presenter face and full animation) and video design elements (static slides, digital ink, Socratic dialogue) were compared. The results of the two studies suggest that it is features of video design as opposed to overall video type that most influences student learning. These results have implications for video production approaches and for further research examining video use in education. The implications for research and practice will be discussed in relation to Multimedia Learning Theory.

Digital procrastination in secondary schools: triggers and enabling conditions

Keywords: Educational Technology, Secondary education, Technology, Multimedia learning

Presenting Author: Thomas Arnesen, Western Norway University of Applied Sciences, Norway; **Co-Author:** Eyvind Elstad, University of Oslo, Norway; **Co-Author:** Elaine Munthe, Stavanger University College, United States

Youth spend a considerable amount of time every day surfing the internet, and some of the interest-driven activities are arguably educationally desirable (Ito, 2010; Buckingham, 2007). In an effort to capitalize on youth's digital strengths, a growing number of schools offer open net-access. Digital procrastination, however, might undermine any educationally productive potential. In an effort to understand the generative mechanisms of digital procrastination, we explore in depth *the factors that trigger and conditions that enable students' digital procrastination in a Norwegian secondary school classroom with open internet access*. Based on critical realist ontological and epistemological assumptions, we conducted a qualitatively driven, mixed methods sequential design consisting of a small-scale survey (N=108), classroom observations and focus-group interviews. The findings indicated five triggers (net-attraction, loss of subject matter task value, vicarious procrastination, transitions, perceived break entitlement) and six enabling conditions (extensive digital access, extensive student freedom, teacher abdication of responsibility, digital norms adjusted to students' patterns of procrastination, student lack of self-regulatory strategies and efficacy). We argue that at the heart of digital procrastination lies the behavioral design of digital distractions that constantly offers and facilitates educationally debilitating behavior. Further, we categorized

students' delay behaviors as either passive or active in relation to the degree of conscious planning and time management. Whereas passive procrastinators were more or less helpless victims of digital distractions' behavioral design, active procrastinators were instrumental in their behaviors intent on maximization of utility. Implications for policy, practice, and further research is discussed.

Coordinated Assessment Design to Explore the Relationship of Teacher Knowledge to Teaching Quality

Keywords: Assessment methods and tools, Educational policy, Science education, Teacher Effectiveness

Presenting Author: Drew Gitomer, Rutgers University, United States; **Co-Author:** Courtney Bell, Educational Testing Service, United States

A substantial body of research has examined the relationships among different measures of teaching quality, including teacher knowledge, classroom observations, classroom artifacts, and student achievement growth. These studies typically have employed a traditional multi-trait, multi-method approach in which correlational analyses are used to examine the extent to which scores on a measure of one construct are related to scores on measures of other constructs. We argue that the methods used to study teaching quality may, in part, account for what are often weak observed relationships. Most studies can be characterized by both a relatively weak theoretical connection among measures and sampling designs that do not support inferences about the nature of relationships among scores on different measures. To support our argument we report the results of a study that uses measures with more explicit theoretical connections and a design that examines knowledge, classroom practice, and student learning within a narrow instructional domain. Specifically, we explore the fundamental question that underlies the construct of content knowledge for teaching (CKT)—what does a teacher know about teaching a particular content area, and how does that knowledge relate to instructional quality and student learning in that content area? Using a theory-based evidence-centered assessment design process (ECD), we develop a broad network of measures, including knowledge assessments, classroom observations and artifact protocols, and measures of student learning, all within the same construct domain, to create and evaluate a coordinated validity argument of CKT.

Thin-Slice Judgements as a Measurement of Instruction Quality

Keywords: Assessment methods and tools, Quantitative methods, Teaching / instruction, Video analysis

Presenting Author: Lukas Begrich, Goethe-Universität Frankfurt, Germany

A drawback of established video-based analysis of teaching lies in its high cost in terms of time and money. The present research examines the possibility of assessing instructional features on the basis of very short observations, respectively first impressions. This procedure which uses judgements based on first impressions has shown high reliability and validity in the assessment of various psychological constructs. In our study untrained raters judged 37 elementary school teachers regarding three dimensions of instructional quality based on 30-second randomly selected sequences from full classroom videos. Both showed very high interrater reliabilities. Further there were significant correlations with ratings of instructional quality given by trained raters based on the full classroom videos. While descriptive analyses indicate a rather undifferentiated judging process, multilevel regression analyses predicting students' achievement gain via ratings of instructional quality indicate a certain predictive validity of first impressions.

How is performance assessment in education set out and its quality measured? A systematic review

Keywords: Assessment methods and tools, Competencies, Higher education, Secondary education

Presenting Author: Liesje Coertjens, Université catholique de Louvain (UCL), Belgium; **Co-Author:** Karen Verswijvel, University of Antwerp, Belgium; **Co-Author:** Alexia Deneire, Antwerp University, Belgium; **Co-Author:** Jetje De Groof, University of Antwerp, Belgium; **Co-Author:** Sven De Maeyer, University of Antwerp, Belgium

To assess students' competences, today's educational institutions increasingly rely on performance assessment. For such performance assessment, students are for example asked to create a product, such as a portfolio, or a presentation. From an educational practice point of view, developing such performance assessment and ensuring its quality is frequently perceived as challenging. A systematic overview of literature on performance assessment and their quality indicators would be suitable to inform educational practice, but is up to present lacking. The present study provides such a systematic literature review of empirical studies on summative performance assessment in primary, secondary and higher education and on the quality indices provided in these studies. From a search in Ebsco and PsychInfo which delivered 4226 unique

articles, 44 were retained. Results indicate a predominance of studies in higher education, on medical education and using Objective Structured Clinical Evaluations or internships. Regarding the quality indices, half of the studies only included indices on reliability, while 36% provided backing for both validity and reliability of the performance assessment.

Accuracy of teachers' judgments of students with consistent and inconsistent profiles

Keywords: Assessment methods and tools, Intelligence, Teaching / instruction, Motivation and emotion

Presenting Author: Anna-Katharina Praetorius, German Institute for International Educational Research (DIPF), Germany;

Co-Author: Anna Suedkamp, TU Dortmund University, Germany; **Co-Author:** Birgit Spinath, Heidelberg University, Germany

Teachers' judgment accuracy is known to differ across teachers, student characteristics and accuracy measures. To what extent teachers' judgment accuracy is stable across sets of student characteristics (i.e., profiles) remains, however, open so far. This is an important question as teachers take a combination of multiple student characteristics into account when fostering student learning, e.g., when choosing instructional activities and material for individual students. In a first step, we analyzed whether groups of students with different ability and motivational profiles can be identified among elementary school children. In a second step, we studied whether teachers judged students with a consistent ability and motivational profile more accurately than students with an inconsistent profile. Overall, $N = 757$ elementary school children and their $N = 41$ classroom teachers participated in the study. Data on students' intelligence, academic self-concept, motivation, and test anxiety as well as teachers' judgments of these student characteristics were available. Using latent profile analyses, we identified two cognitive-motivational profiles. In contrast to our expectations, multi-group regression analyses showed no differences in teachers' judgment accuracy of students with consistent and inconsistent profiles.

Interpersonal skills in CSCL-environments: Do they predict student individual and group performance?

Keywords: Computer-supported collaborative learning, Conversation / Discourse analysis, Emotion and affect, Problem-based learning

Presenting Author: Bert Slof, Utrecht University, Netherlands; **Co-Author:** Jeroen Janssen, Utrecht University, Netherlands; **Co-Author:** Danique Nijdam, University Utrecht, Netherlands

The effectiveness of Computer-Supported Collaborative Learning (CSCL) heavily depends on whether its members function effectively as a group. Dealing with barriers, such as free riding social loafing, requires the utilization of interpersonal skills. Based on the interpersonal theory, the skills were operationalized in terms of communion (displaying empathic behaviour, e.g., being helpful) and agency (displaying dominant behaviour, e.g., leadership). In this paper we examined to what extent students' utilized and perceived interpersonal skills predict individual and group performance. Secondary education students (87) were, within classes, randomly assigned to 29 triads and had to solve a business-economics problem. The utilized interpersonal skills were measured by coding the chat-utterances of the group discussions. A questionnaire was administered, after task completion, to measure the perceived interpersonal skills. A pre-test and a post-test were administered to measure individual performance. Group performance was measured by coding the quality of the problem-solution. Multi-level analysis, corrected for pre-test performance, revealed that the utilized agency and communion skill positively predict individual performance. Multiple regression analysis revealed that the group level scores for utilized and perceived interpersonal skills and pre-test performance did not significantly predict group performance. The results suggest that students' utilized interpersonal skills significantly predict the degree to which CSCL has an impact student individual performance. Furthermore, possible explanations for the non-significant results for the perceived interpersonal skills as well as the lack of significant findings for the effects on group performance are provided.

The road to hell is paved with good intentions, but what happens to them along the way?

Keywords: Achievement, E-learning / Online learning, Informal learning, Motivation

Presenting Author: Maartje Henderikx, Open University of the Netherlands, Netherlands; **Co-Author:** Karel Kreijns, Open University of the Netherlands, Netherlands; **Co-Author:** Marco Kalz, Open University of the Netherlands, Netherlands

Currently success measurement of MOOCs is certificate- and completion-centric and fails to take student intention into account. While this view of success has been criticized by the research community, no suitable alternative has yet been developed. This study addresses this gap and proposes a theoretically grounded model for measuring success and dropout

in MOOCs. The reasoned action approach (RAA) by Fishbein & Ajzen (2010), which centers around the formation of an intention to achieve certain goals, serves as a theoretical framework for our model, in particular the intention-behaviour gap. A new model for measuring success and dropout in MOOCs is proposed. This model redefines success in MOOCs as all MOOC-takers who achieve their individually intended goals are considered successful. The model also provides insight into the dynamics of the intention-behaviour process on an individual level and therefore into possible reasons that can cause the intention-behaviour gap.

Object-oriented learning activities to innovate Higher Education: a case-study

Keywords: Case studies, Computer-supported collaborative learning, Design based research, Knowledge creation

Presenting Author:Nadia Sansone, Sapienza University of Rome, Italy; **Co-Author:**Donatella Cesareni, University of Rome, Italy

This paper describes a case-study in which the Trialological Learning Approach (TLA) has been applied to a university course for Psychologists. Our aim was to observe how TLA impacts on students' participation, learning and appreciation of the course, thus gathering suggestions on how to improve it, in accordance with the Design-based Research methodology inspiring our study. To this end, it has been provided a double implementation of the course. Fifty-five students participated to the first course, divided in six groups of 9 students in average. Following TLA prescriptions, a set of individual and collaborative technology-supported activities was orchestrated, leading to the creation of a shared and meaningful object. Observational and ethnographic data has been collected so far: 969 web-forum posts; 44 pre-post questionnaire investigating students' perception about the acquisition of knowledge work competencies. On these data we have performed quali-quantitative analysis, by the use of specific codebooks for the content analysis. Preliminary results indicate a generally positive impact in terms of students' participation and satisfaction of the activities. Students of the first course have gradually learnt effective methods of discussion, capable of activating knowledge building and collaboration. However, the analysis allowed us to identify some areas for improvement and to redesign the course – currently ongoing - by reviewing a few activities and introducing new ones. Similarly, we have perfected the method. In the presentation, it will be shown the comparison between the two editions in terms of intervention, method and results.

Children's scientific thinking skills for programming a robotic car

Keywords: Assessment methods and tools, Computer-supported collaborative learning, Educational Technology, Inquiry learning

Presenting Author:Eva van de Sande, Radboud University Nijmegen, Netherlands; **Co-Author:**Tijs Kleemans, Radboud University Nijmegen, Netherlands; **Co-Author:**Ludo Verhoeven, Radboud University Nijmegen, Netherlands; **Co-Author:**Eliane Segers, Radboud University Nijmegen / University of Twente, Netherlands

Although the need and popularity for programming experiences in young children rapidly increase, it is by no means clear how children perform while programming. Moreover, very little empirical studies to date have focused on the widespread claim that programming is a rich learning environment to exercise scientific thinking skills. Such thinking entails the 21st century skills to discover, examine, and reflect during knowledge seeking. The present study therefore examined (1) the processes while children program a route for a Lego Mindstorms © car, and (2) how these processes relate to their scientific thinking. Scientific thinking skills were assessed in 292 children, who then programmed Lego Mindstorms© robots for a required route on a map. Children's programming behaviors were recorded on process and outcome variables, such as programming efforts, testdrives, and endpoint that was succeeded on the map. Results indicate that children used different strategies of varying efficiency to program the robotic car, and that these strategies related to children's scientific thinking skills.

Positive effects of physical and mindfulness training on children's attention and academic skills

Keywords: Cognitive development, Cognitive skills, Motivation, School effectiveness

Presenting Author:Christian Müller, Goethe-University Frankfurt, Germany; **Co-Author:**Sven Lindberg, Deutsches Institut für Internationale Pädagogische Forschung (DIPF), Germany; **Co-Author:**Viktoria Sawitzki, Goethe University Frankfurt, Germany; **Co-Author:**Priyanga Kanagalingam, Goethe University Frankfurt, Germany; **Co-Author:**Steffen Scherer, Deutsches Institut für Internationale Pädagogische Forschung (DIPF), Germany; **Co-Author:**Christoph Mickel, Goethe-

Universität Frankfurt, Germany; **Co-Author:** Julia Karbach, Goethe-Universität Frankfurt, Germany

The goal of this study was to investigate effects of a physical training and mindfulness training in the classroom on attention and academic skills of children. Both studies with pretest-training-posttest designs consisted of a ten-minutes-per-day for two weeks standardized intervention. An audio-CD with instructions and music was produced for both studies and played while research assistants of the university performed either physical training exercises (e. g. cardiovascular activation) or mindfulness exercises (e. g. body scans) with children together in the classroom. Different attention skills, one measure for reading and for mathematics and different motivational sub-scales were used as independent variables. The sample in study one consisted of 157 elementary school children aged between nine and ten years visiting urban elementary schools in Germany and the second study consisted of 101 school children aged between ten and twelve visiting fifth and sixth grade. Intervention and control groups did not differ in age, intelligence, sex or pre-test differences for independent variables. Moderate interaction effects between intervention and control group were found for attention speed and visual scanning speed in study one and for reading in study two. In sum results indicate that acute physical training as well as mindfulness training can improve cognitive performance in children and young adults. We will discuss implications of these findings and issues that should be addressed in future work for instance training regimes including both physical training and mindfulness training aspects.

Impact of parental beliefs and teacher expectations on mono- and multilingual students' achievement

Keywords: Achievement, Primary education, Quantitative methods, Social aspects of learning and teaching

Presenting Author: Edith Niederbacher, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland;

Co-Author: Markus P. Neuenschwander, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

The present research examines how the mother tongue, parental beliefs and teacher expectations influence the achievement development of mono- and multilingual children in primary education. The study investigates if a) the parents' perceived efficacy regarding the support of their child's achievement and teachers' achievement expectations are mediating the impact of the mother tongue on the students' achievement development and b) how those factors are interacting. The sample consists of 541 monolingual German speaking and 274 foreign-language speaking or multilingual students from three Swiss cantons. They completed questionnaires and achievement tests in the subjects Mathematics and German in the 5th and 6th grade of primary school. Questionnaires were also filled in by their parents and teachers. The findings reveal that the mother tongue influences the students' achievement development between the two measurements in the subject German, but not in Mathematics. The effect of the mother tongue on achievement development is significantly mediated by the parents' perception of efficacy regarding the support of their child's achievement, but not by teacher expectations. The direct effects of the parents' perception of their efficacy in school related supporting and teacher expectations on achievement development are significant in both subjects. Furthermore, the perceived support efficacy of parents is fully mediated by teacher expectations in Mathematics and partially mediated in German. Implications for educational practice of these mediation effects will be discussed.

It is great she is really checking she wants us to pass – Facilitating student project work

Keywords: Collaborative Learning, Conversation / Discourse analysis, Social aspects of learning and teaching, Teaching / instruction

Presenting Author: Anders Eklöf, Kristianstad University, Sweden; **Co-Author:** Tina Kullenberg, Kristianstad University, Sweden; **Co-Author:** Lars-Erik Nilsson, Kristianstad University, Sweden

All students in Swedish upper secondary school have to do one mandatory project work course aimed at developing general skills such as independence, initiative, creativity and imagination. The students have to pass the course to receive their upper secondary diploma. Our study aims to investigate how students talk about the task of doing 'independent' project works in the diploma course. Three focus group conversations of totaling twelve students are filmed and analyzed through topic analysis, an analytical approach based on dialogism as theoretical framework. The empirical material is analyzed from a perspective of how the design of the project course and the assessment regime influences the students work. Findings indicate that the students rely heavily on help and instruction from the teacher. They perceive of this help as a crucial asset in passing the diploma course. They state that the kind of help they receive are strongly focused towards the dividing line between pass and fail. Help is hardwired towards the scientific form and the content of their essays are treated as almost uninteresting. Support for independence therefore seems to be significantly restricted in practice. The teacher is in fact working as a facilitator guiding students towards dependence. This is accomplished through framing doing project work as doing template science.

Applying analytics to multimodal data: Methodological challenges and opportunities

Keywords: Computer-assisted learning, Conversation / Discourse analysis, Cooperative / collaborative learning, Learning analytics

Presenting Author: Jonathan White, Dalarna University, Sweden; **Presenting Author:** Sangeeta Bagga-Gupta, Jönköping University, Sweden; **Co-Author:** Giulia Messina Dahlberg, University of Skövde, Sweden

In this paper, we present analyses regarding some of the challenges and opportunities of applying learning analytics to multimodal online discourse. The data come from seminars held through the videoconferencing platform Adobe Connect on a beginners' course in Italian run by a Swedish university. Building on our previous analysis of the blurring of boundaries

between the oral and written modes, this presentation focuses on how this blurring affects students' noticing. What is the role of the written text in an otherwise oral discussion, and how do students notice textual comments? Silence is another issue that is relevant, as reading textchat bring additional instances of silence into the oral discussion. How is this navigated by students? Finally, we discuss issues arising from the methods of learning analytics. What normative challenges arise for the researchers in applying analytics to such a hybrid data form? We argue that analytics can bring a rigor to research into multi-model data, but that there are considerable challenges given that computer-mediated communication in general, and especially multi-modal communication, is changing the norms of research methodology and language use. Such data challenges us as researchers, but equally brings opportunities for insights into new media communication. We will present empirical examples using learning analytics based on discourse analysis, and preliminary findings show that a range of methodologies need to be put to work to create the learning analytics able to study the richness of multimodal environments, requiring in particular a dialogical approach to knowledge creation.

Shaping participation in vocational training interactions: the case of schisming

Keywords: Conversation / Discourse analysis, Social interaction, Vocational education, Workplace learning

Presenting Author: Laurent Fillietaz, University of Geneva, Switzerland; **Co-Author:** Vassiliki Markaki, University of Grenoble, France

This paper focuses on one empirical field of the school-to-work transition: that of the vocational training of students learning to become early-childhood educators. During internships in early childhood day care centers, students have the opportunity to experience educational activities involving children, under the close guidance of mentors, who are qualified staff members. The paper examines the sorts of interactional competences and institutional demands required from students as they engage in complex forms of participation combining educational and training purposes. In the paper, we focus on a series of empirical cases, recorded through video data and analysed in a conversation analytic perspective (Sacks, Schegloff & Jefferson, 1973; Schegloff, 2007), in which mentors make the decision to intervene, and therefore to guide or shape children's behavior, during a session moderated by the student. Such interventions do not interrupt the student's activity and lead to the emergence of two distinct but not impermeable interactional spaces. This complex participation framework, known as "schisming" (Egbert, 1993), contributes to overcome practical issues within multiparty settings. Our study shows how schisming constitutes a particular sequential phenomenon where participants re-organize the interaction and co-construct a social and cognitive interactional space, thus enabling a shared understanding of the specific training context.

Exploring How Wiki-blogs are constituted as Learning Resources in a Science Project

Keywords: Science education, Secondary education, Social interaction, Video analysis

Presenting Author: Astrid Camilla Wiig, University College of Southeast Norway, Norway; **Co-Author:** Anne Line Wittek, University of Oslo, Norway

Exploring how Wiki-blogs contribute to structuring learning activities, the paper draws on data from an empirical, longitudinal study in a lower secondary school in Norway to analyze dialogues and interactions in a science project lasting for 2 months. The analysis is based on sociocultural and dialogical approaches to learning with mediational means, in which video data, Wiki-blogs and students written laboratory reports is subjected to interaction analysis. The focus of the analysis is on episodes where the teacher encounter the Wiki-blog as a resource for learning and meaning-making. The findings show that the Wiki-blogs to a significant degree structure the learning activities. In line with Wegerif (2010), our findings illuminates that while the Wiki-blog is not itself a dialogic space, it appears to make possible opening, expanding and deepening dialogic space. However, the results show that the potential of the Wiki-blog must be considered in light of several crucial issues. The constitution of the Wiki-blog invites to certain types of activities such as a normative way to construct laboratory reports in a digital manner. In addition, our findings illuminates that the learning activities encountering the Wiki-blog make possible dialogues of what is considered as accountable to the learning community such as sharing and copying. The accountability to knowledge that is accurate and relevant and the accountability to accepted standards of reasoning is negotiated in the classroom dialogues, and make visible *the thinking* with the Wiki-blogs as learning resources.

Integration and language acquisition: a link built by governmental program's makers and other actors

Keywords: Educational policy, Language (Foreign and second), Qualitative methods, Social interaction

Presenting Author:Stéphanie Bailat, University of Lausanne, Switzerland

Adopting a sociocultural approach in psychology, the paper presents a research on a governmental program, which aims to increase the quality of language courses for immigrants in Switzerland. Many studies on legal frameworks of European countries have highlighted a strong relationship between language education for immigrants and their "integration". The public policies and governmental programs, which result from this context, are built on a tension between the will to give access to language learning to immigrants and the will to use their linguistic abilities to evaluate the "level of integration". According to the perspective that designing a governmental program of language education and learning French are not only cognitive processes, but engaged also socio-cognitive processes and processes of meaning making, this paper tries to better understand: 1) how the governmental program's designers define and negotiate the identity of this program, its boundaries, and their own role in it and 2) how they perceive and construct a representation of the French teachers and the immigrants. By recorded and non-recorded observations, interviews and analysis of documents written by the program's designers, the analysis of the discourses and practices seems to show that the designers construct and negotiate among themselves and with other institutional actors the meaning of the program, of their role and of the practices of French teachers. Furthermore, while the program announces the immigrants as principal beneficiaries, they seem seldom take into consideration the immigrants' perspective in the implementation of the program.

Professional identity management in a thematic Facebook group

Keywords: Cooperative / collaborative learning, E-learning / Online learning, Social interaction, Teacher Professional Development

Presenting Author:Louise Peterson, University of Gothenburg, Sweden; **Co-Author:**Annika Lantz-Andersson, University of Gothenburg, Sweden; **Co-Author:**Thomas Hillman, University of Gothenburg, Sweden; **Co-Author:**Annika Bergviken-Rensfeldt, University of Gothenburg, Sweden; **Co-Author:**Mona Lundin, University of Gothenburg, Sweden

Recent research has suggested that it is becoming more common for teachers to participate in social media groups as spaces for collegial discussions. This study examines ways a controversial issue raised in a large self-organised Facebook group of professional character is continued in the discussion that follows. The aim is to study how social support is performed through moment-by-moment online interactions based on empirical data from a large corpus assembled through the Facebook Application Programming Interface. Findings are based on computational content analysis of the corpus of group activity, accompanied by in-depth examination of the communication in one selected discussion thread, initiated by a post describing a critical incident in a teachers' professional practice. Detailed analysis of the selected thread is carried out using the Goffmanian interactional, dramaturgical approach with the notions of *performance team*, together with *supportive* and *remedial interchanges* used as orienting concepts. The findings illustrate how the performance of social support in the thread includes both *supportive* and *remedial interchanges* that reveal an emergent impression management and a mutually shaped professional teacher identity. They suggest that member *performance*, generally relatively neutral in non-controversial discussion threads, changes in relation to the controversial post that challenges the groups collective identity. It engenders cooperative and supportive interchanges that occasion members to perform as a team and cooperate as supportive team-mates.

Confidence- and conflict-based regulation in individual and collaborative learning

Keywords: Computer-supported collaborative learning, Learning approaches, Metacognition, Self-regulation

Presenting Author:Lenka Schnaubert, University of Duisburg-Essen, Germany; **Co-Author:**Daniel Bodemer, University of Duisburg-Essen, Germany

The regulation of learning processes is a requirement for individual as well as collaborative learning. While metacognitive research is mainly concerned with metacognitive regulation (i.e., based on confidence or judgments of learning), collaborative learning settings include study decisions based on social information, e.g., conflicting assumptions or opinions. Visualising learning-relevant information may foster individual as well as collaborative learning and may support learning processes by signalling relevant information and guiding learning. Thus, over a series of studies (individual study:

$N = 63$; individual study: $N = 61$; collaborative study: $N = 130$ dyads) we investigated the impact of visualising cognitive and / or metacognitive self- and partner-information in individual and collaborative learning settings to assess its impact on metacognitive and conflict-based regulation. We found that visualisations had a strong impact on the usage of the visualised information for regulating learning in both settings with metacognitive self-information fostering metacognitive regulation and cognitive partner-information fostering conflict-based regulation. While the interaction mechanisms of cognitive and metacognitive self- and partner information remain widely unclear, the results suggest that learners attend to metacognitive and conflict-based information independently and to a similar extent.

Modelling the Dual Nature of Epistemic Beliefs

Keywords: Attitudes and beliefs, Metacognition, Pre-service teacher education, Quantitative methods

Presenting Author:Samuel Merk, University of Tübingen, Germany; **Co-Author:**Tom Rosman, Leibniz Institute for Psychology Information, Germany

In the past two decades, there has been a growing interest in investigating beliefs about knowing and knowledge - so called epistemic beliefs. Amongst others, there has been a virulent discussion about the domain-specificity of these beliefs: While some theoretical frameworks and empirical results suggested that there is no within-person variance in epistemic beliefs (in other words, that epistemic beliefs are not domain-specific) other researchers published findings and proposed frameworks that include domain-specificity. Nowadays, a broad consensus has emerged that epistemic beliefs are “dual” (or multilayered) in nature, meaning that they include both domain-general and more specific aspects. However, one may criticise that the corresponding frameworks did not find their way into actual empirical research. In fact, epistemic beliefs are still mainly operationalized as either domain general or more specific (i.e., domain- or topic-specific). We expect that multilevel modelling designs are ideally suited to respect the theoretically proposed dual nature of epistemic beliefs since they can handle within-person variation and between-person differences simultaneously. The paper presentation tests this expectation and exemplifies two applications of the suggested modelling technique. To do so, we assessed topic-specific, domain-specific and domain-general epistemic beliefs of pre-service teachers in two separate studies ($n_1 = 232$, $n_2 = 323$). Results show that the main fraction of variance in topic-specific epistemic beliefs is located at the topic-level and that epistemic beliefs assessed at higher levels predict topic-specific epistemic beliefs. In sum, our results can be interpreted as further evidence for a dual nature of epistemic beliefs.

A Cognitive Diagnostic Model: High-order Thinking and Metacognition involved in Mathematics

Keywords: Cognitive skills, Mathematics, Metacognition, Psychometrics

Presenting Author:Tahsin Oğuz Başokçu, Ege University, Turkey; **Co-Author:**M. Akif Guzel, Middle East Technical University Northern Cyprus Campus, Turkey

The study aimed at identifying the levels of metacognitive skills in the tests that are prepared to facilitate high-order thinking abilities. It specifically retained a goal to empirically assess the level of consciousness that the respondents have on their knowledge in the context of mathematics of both PISA and TIMSS tests. The study, designed as a pre-test of a large-sample study ($N=3684$), tested 224 12 year-old students in total. The study measured the content knowledge of the students as well as their mathematical capabilities. The analyses on the obtained levels of content knowledge and mathematical capabilities were run by utilizing Cognitive Diagnostic Model (CDM). Rejecting the assumption rained in conventional assessments that each item (i.e., question) measures a single attribute only, CDM however allows to associate an item to multiple attributes. Therefore, both content knowledge and fundamental mathematical capabilities can be assessed via using the same items simultaneously. It is also suggested herein that the metacognitive abilities of the latent classes determined by CDM can also be measured by the methods of Type-II Signal Detection Theory (SDT) (i.e., response contingent SDT). The study overall disentangles as well as points out the vitality of revealing not only the cognitive abilities both also the metacognitive ones of the respondents simultaneously, which seems to be neglected in various assessment tools, just like in PISA and TIMSS tests until recently.

Challenges in an Online Collaboration: Effects of Scripting Shared Task Perceptions

Keywords: Collaborative Learning, Computer-supported collaborative learning, Metacognition, Self-regulation

Presenting Author:Aishah Bakhtiar, University of Victoria, Canada; **Co-Author:**Allyson Hadwin, University of Victoria, Canada; **Co-Author:**Mariel Miller, University of Victoria, Canada; **Co-Author:**Rebecca Edwards, University of Victoria, Canada; **Co-Author:**Todd Milford, University of Victoria, Canada

The mark of successful regulation is strategic adaptation in response to challenging situations. In group work, the research to date points to at least five broad types of challenges experienced by groups across a variety of settings: motivational, socio-emotional, cognitive, metacognitive, and environmental (e.g., McCardle, et al., 2011). SRL theory posits that planning, especially having shared perceptions about the collaborative task, is critical in ameliorating group work challenges. Hence, the purpose of this study was to examine the effects of providing different types of planning support—numeric, non-numeric, and no-visualization— on group members’ reported challenges. Transitional probabilities revealed dominant differences across support conditions. Individuals belonging to groups that received some form of planning visualization (either numeric or non-numeric) were more likely to choose appropriate strategies than those given no-visualization planning support. Findings attest to the need to support awareness of group processes for collaborative teams at planning.

Is democratic agency possible? How an international school network puts its 'IDEALS' into practice

Keywords: Citizenship education, Mixed-method research, Values education, Multicultural education

Presenting Author: Rupert Higham, University of Cambridge, United Kingdom; **Co-Author:** Natalie Djohari, Visiting Research Fellow, Goldsmiths' College, University of London, United Kingdom

Round Square is a worldwide network of 170 independent schools committed to promoting the values of Internationalism, Democracy, Environmentalism, Adventure, Leadership and Service, founded in the philosophy of Kurt Hahn. The researchers critically investigated how these IDEALS are interpreted by students, teachers and parents. An extensive survey received 4020 student and 863 teacher returns; data was analysed through theme exploration and comparative ranking. Five case study schools from different continents were chosen: from each, Heads and Round Square leaders were interviewed, pairs of senior students were trained to run two focus groups, and parents engaged in email exchanges. Stakeholders agreed that the IDEALS are interconnected, important to them personally and to their schools, with remarkable consistency across gender, region, age and role; this suggests relative homogeneity of values across this geographically diverse but socioeconomically privileged network. Stakeholders saw the IDEALS as providing students a moral foundation for life, against a perceived cultural tide of competitiveness, selfishness and gratification; they told remarkable stories of children's transformation, particularly through engaging in international projects, conferences and exchanges. They also highlighted tensions. 'Democracy' was rated very important, but poorly implemented; we found it thinly understood by many, intertwined with insular and role-dominated understandings of leadership, and particularly focused on student elections to representative roles. We suggest that Hahn's focus on adolescents' individual moral development is too individualistic; instead we proposed a dialogic, interpersonal, neo-existentialist focus on authentic responses to difference. Round Square is now exploring our suggestions for strengthening the IDEALS through student-led research.

A comprehensive framework for assessing college students' reactions to faculty incivility

Keywords: Content analysis, Higher education, Mixed-method research, Morality

Presenting Author: Dorit Alt, Kinneret College on the Sea of Galilee, Israel; **Co-Author:** Yariv Itzkovich, Kinneret College on the Sea of Galilee, Israel

Incivility in the academic arena elicits a wide range of reactions: it interferes with learning, increases stress, feelings of disrespect and helplessness. Although reactions to incivility were mainly tested in workplaces, an extensive, robust framework to explain and measure responses to faculty incivility (FI) is yet to be offered. This study used facet theory (FT) approach with smallest space analysis (SSA), as well as confirmatory factor analysis (CFA) to corroborate the theoretical structure of reactions to FI. In accordance with the FT strategy used in this study, a mapping sentence was constructed expressing the composite of three individual facets based on the theoretical framework: Facet A including four types of reactions (1)Exit (2)Voice (3)Loyalty and (4)Neglect (EVLN); Facet B reflecting the *destructiveness – constructiveness* theoretical dimension, and Facet C illustrating a dimension ranging from *passive* to *active* responses. Data were gathered by a scale measuring students' reactions to FI, and finally, a multidimensional statistical technique of SSA was applied. According to the findings, the CFA result presented four relatively interpretable factors (EVLN) while the SSA allowed for the examination of these factors as well as additional facets (B and C). The findings clearly indicated that the latest theoretical variation of the EVLN model is valid as a framework for explaining and measuring reactions to FI. Methodologically, the use of the SSA unrestrictive approach in this exploratory study helped revealing insights that the CFA technique has not revealed.

Shaping the Resilient Subject: Professional Interventions, Culture and Politics in Israeli Schools

Keywords: Citizenship education, Culture, Morality, Quantitative methods

Presenting Author: Galia Plotkin Amrami, Ben-Gurion University of the Negev, Israel

While the concept of resilience has attracted a great deal of academic interest, less attention has been paid to the particular traits of the resilient subject. In this presentation I extract the prototype of the resilient student as constructed through mental health projects that build resilience in Israeli schools in the context of the Israeli-Palestinian conflict. Drawing on sociological scholarship that interweaves the domains of therapeutic discourse and cultural context, I describe the resilient subject not only as a psychological but also as cultural prototype. Based on analysis of the manuals of resilience building projects that were designed and implemented by leading mental health centers in Israeli schools, I demonstrate that the design of the resilient student is actualized primarily through emotional, physical and cognitive work.

The professional practices foster the ability to process feelings, think rationally and control instinctive and potentially damaging emotional reactions. I argue that the prototype of the resilient subject emerges as one characterized by the avoidance of violent behavior. This ethics of non violence draws on the western cultural ideal of a normative personality and status of emotions in western therapeutic culture rather than on a particular political context. However the impact of professional interventions on the design of students' civil beliefs regarding the conflict might warrant consideration.

Children's epistemic beliefs for moral reasoning in elementary school: a longitudinal study

Keywords: Attitudes and beliefs, Citizenship education, Cognitive skills, Values education

Presenting Author:Jo Lunn Brownlee, Queensland University of Technology, Australia; **Co-Author:**Susan Walker, Queensland University of Technology, Australia; **Co-Author:**Eva Johansson, University of Stavanger, Norway; **Co-Author:**Laura Scholes, Queensland University of Technology (QUT), Australia; **Co-Author:**Donna Berthelsen, Queensland University of Technology, Australia

In recent years, issues related to citizenship education and values for democracy have been emphasised in educational policies worldwide. In promoting children as active citizens, we need to understand how children reason about social and moral values. The capacity to reason about others' perspectives reflects individuals' epistemic beliefs, which are the beliefs we hold about knowing and knowledge. The study investigated changes in children's epistemic beliefs in the context of moral reasoning for active citizenship. Scenario-based interviews explored children's epistemic beliefs across the early years of elementary school (Years 1, 2, and 3) in 10 independent and public schools in Queensland, Australia. Children provided their perspectives in response to conflicting opinions expressed in three scenarios across domains requiring judgements about moral values, ambiguous facts, and personal taste. The use of three judgement domains enabled comparisons to be drawn between moral values and the other domains of reasoning. The data showed changes in epistemic beliefs occurred between Year 1 and 2 for personal taste and between Year 2 and 3 in the moral and ambiguous judgment domains. The findings showed that children were more likely to accept that people can hold different beliefs about personal taste at an earlier age than for ambiguous facts and moral judgements in which there is only one correct answer. We argue that it is important for teachers to pay attention to children's beliefs about knowledge and knowing in the process of scaffolding their reasoning, especially in domains related to moral values for active citizenship.

Misconceptions Impede Text Comprehension and Metacomprehension Accuracy in the Domain of Statistics

Keywords: Metacognition, Misconceptions, Reading comprehension, Self-regulation

Presenting Author:Anja Prinz, University of Freiburg, Germany; **Co-Author:**Stefanie Golke, University of Freiburg, Germany; **Co-Author:**Joerg Wittwer, University of Freiburg, Germany

Prior research shows that misconceptions have detrimental effects on text comprehension. However, whether misconceptions also impair metacomprehension accuracy, that is, the accuracy with which one self-assesses one's own text comprehension, has received far less attention. Yet, this ability usually affects whether learners engage in further learning activities to eliminate problems of understanding. We conducted a correlational study with $N = 49$ university students with varying levels of statistical misconceptions and examined the extent to which their misconceptions affected their comprehension and metacomprehension accuracy when reading an expository statistics text. Comprehension and metacomprehension accuracy referred to both conceptual and procedural aspects of statistics. The results showed that misconceptions not only impaired students' conceptual text comprehension but also prevented them from accurately self-assessing their text comprehension as indicated by overconfident predictions of their conceptual and procedural comprehension. This finding suggests that students with misconceptions would fail to engage in further learning activities that would correct and enhance their text comprehension. The results call for methods to overcome misconceptions in the service of improving text comprehension and metacomprehension accuracy.

Does visualization affect text comprehension monitoring, restudy choice, and comprehension scores?

Keywords: Cognitive skills, Comprehension of text and graphics, Metacognition, Self-regulation

Presenting Author:Danny Kostons, University of Groningen, Netherlands; **Co-Author:**Björn de Koning, Erasmus University Rotterdam, Netherlands

In the present study, we investigated how 116 fourth and fifth grade students' monitoring skills were associated with restudy

choices and explored whether drawing was a useful intervention to improve monitoring accuracy, restudy choice, and reading scores. During the first session, all students read a text, judged their comprehension of the information within that text, selected paragraphs to reread, reread those parts, and then made another judgment of comprehension before doing a post-test. Positive correlations were found between the posttest and Judgments of Learning, posttest and JOL-accuracy, and number of paragraphs reread and JOL-accuracy, as well as negative correlations between effort and JOLs, and JOLs and number of chapters reread. For the second session, students were split-up into three conditions: a control condition and two drawing conditions. In the long-drawing condition, students were allowed to draw throughout the whole second session, including post-test. In the brief-drawing condition participants only got to draw the first time they read the second text. We did not find the expected differences between conditions on the post-test. And contrary to our findings, having the drawing available all the time, led to significantly lower accuracy on judgments of learning and higher mental effort compared to the other two conditions. Drawing more elements was positively correlated with the posttest scores and JOLs, whereas drawing more details was negatively correlated with posttest scores and did not correlate with JOLs.

Immediate and Long-Term Effects of Training in 'Learning by Teaching' on Knowledge of Cognition

Keywords: Cognitive skills, Pre-service teacher education, Teaching approaches, Technology

Presenting Author: Mary Gutman, Efrata College, Israel

Learning By Teaching (LBT) programs for pre-service teachers in two different environments (technological and face-to-face) were compared using 100 pre-service teachers as subjects. Both programs were based on the IMPROVE instructional method (Mevarech & Kramarski, 1997) which provides explicit metacognitive steps for LBT with a dual perspective (2P): that of teacher and that of learner. The dependent variables Knowledge of Cognition (KC) in learning and teaching were tested for their immediate and long-term effects in a technology-based system group (TBS+2P), and Face-to-Face group (F2F+2P). Post-test results of KC indicate that the TBS+2P group showed a higher level of conditional and procedural knowledge of teaching. The TBS+2P group also outperformed in measures of long-term effects of declarative knowledge in teaching. Both theoretical and practical implications of this study are discussed.

Help-seeking and private speech during a problem-solving task in 2-5 year olds

Keywords: Early childhood education, Metacognition, Motivation, Self-regulation

Presenting Author: Loren Marulis, Connecticut College, United States; **Co-Author:** Lindsey Nelson, Connecticut College, United States

Private speech and help-seeking behaviors have found new traction through Zimmerman's conceptualization of self regulated learners as "metacognitively, motivationally, and behaviorally active participants in their learning....and are aware when they know a fact or possess a skill and when they do not and, unlike passive classmates....proactively seek out information when needed and take necessary steps to master it" (1990, p. 4). Likewise, Vygotsky noted that young children use private speech while trying to understand new situations, problem-solve, and plan. Essentially, young children's private speech is an early type of self-regulation (Manning et al., 1994; Winsler et al., 2005). The current study is a follow-up of Metacognitive Processes in Development [MinD], through which we analyzed metacognitive skills (i.e., knowledge; behavior) using a puzzle task in a College lab school (2-5 year olds), by examining associations to executive functioning (EF) and motivation. Many of the children used private speech during the puzzle task, particularly when it got challenging to self soothe, problem-solve, and speak about prior experiences/ knowledge.

We propose that expressive language (to self or others) is a critical mechanism enhancing self-regulated learning particularly for children at risk for learning difficulties. Specifically, we are investigating private speech and help-seeking behaviors as predictors of metacognitive skills, EF, motivation, and task performance and examining whether demographic variables (e.g., SES, race, family structure) moderate these learning-related skills. Preliminary results indicate that children who used more private speech during the puzzle task had higher metacognitive, EF, motivation, and performance skills.

The Argumentation Rating Tool: Supporting Systematic Reflection on the Quality of Classroom Talk

Keywords: Argumentation, Assessment methods and tools, Primary education, Teacher Professional Development

Presenting Author: Alina Reznitskaya, Montclair State University, United States; **Co-Author:** Ian A.G. Wilkinson, The Ohio State University, United States

This paper discusses the Argumentation Rating Tool (ART), an observational rating scale designed to help practitioners assess the quality of teacher facilitation and student argumentation during group discussions of texts in elementary language arts classrooms. Users of the ART watch short segments of videotaped discussions and apply a set of evaluation criteria. We describe the theoretical and empirical foundations of the ART and discuss several validation studies. In these studies, we analyzed teacher reactions to using the ART during a year-long professional development program designed to help teachers acquire knowledge and skills to facilitate discussions that engage students in collaborative and rigorous argumentation. We also examined the psychometric properties of the ART. The results show high inter-rater reliability and internal consistency of the ART scores. We also confirmed the ART's sensitivity to experimental manipulation of talk and documented medium-to-high correlations with scores on two criterion measures. In conclusion, we found the ART to be a promising assessment and instructional tool that can be used as part of a comprehensive professional development program to help distill research-based practices and support systematic reflection on the quality of classroom talk.

Effects of learning about evolution on religious belief: Israeli schools as a natural experiment

Keywords: Argumentation, Attitudes and beliefs, Culture, Social aspects of learning and teaching

Presenting Author:Eli Gottlieb, Mandel Leadership Institute, Israel

This year's EARLI conference theme challenges us to connect research on learning and instruction to contemporary political debates. Evolution is a key concept in biological sciences and yet, in many societies, also one of the most controversial. Several studies have examined how students' religious beliefs affect their learning about evolution. This study examines the effects of learning about evolution on students' religious beliefs. Israel is a natural laboratory for exploring these effects because its public school system includes both religious and secular schools, all of which are required to teach evolutionary theory as part of the national biology curriculum. In individual interviews, 200 fifth, eighth, and twelfth graders from religious and secular schools in Israel were asked to justify their beliefs about whether or not God exists. Many of the arguments that students offered referred explicitly to creation and evolution. Analyses of how these arguments were distributed across the sample indicate intriguing patterns of divergence between the two types of school, despite the fact that evolution is taught in both of them. These differences indicate that contemporary political debates about the teaching of evolution in public schools mistakenly cast scientific and religious thinking as polar opposites. In practice, students find a variety of ways to accommodate religious and scientific argumentation and to assimilate what they learn about evolution with their other beliefs.

The Development of Relational Reasoning in Children and Youth

Keywords: Cognitive skills, Developmental processes, Reasoning, Student learning

Presenting Author:Patricia A. Alexander, University of Maryland, United States; **Co-Author:**Sophie Jablansky, University of Maryland, United States

The purpose of this investigation was to explain the relational reasoning of 59 K-12 students in New Zealand engaged in the analysis of form and function of familiar and unfamiliar technological objects. These reasoning data were gathered at two time points. Time 1 was at the outset of these students' participation in a curricular innovation intended to increase their technological literacy. Time 2 took place almost two years later at the conclusion of the curricular program. For analytic purposes, the sample was divided into three groups (i.e., Early, Middle, and Late) corresponding to grade level. The longitudinal data for 59 students revealed the presence of relational reasoning at all grade levels for both time points. However, the frequency and form of that reasoning varied by group, and there were differential shifts in reasoning patterns over the period of this study. In addition, there were unique patterns in students' use of relational reasoning for familiar versus unfamiliar objects, although the role of familiarity was more influential for younger versus older students. The implications of this longitudinal investigation of relational reasoning will be considered.

A perfect match? Studying the role of source expertise and evidence type in claim evaluation

Keywords: Argumentation, Literacy, Reasoning, Science education

Presenting Author:Eva Thomm, University of Erfurt, Germany; **Co-Author:**Rainer Bromme, University of Münster, Germany

Laypeople increasingly need to reason about science-related knowledge claims. A prime example are claims about health-related topics. Prior research underscores the relevance of particularly two evidence types: both statistical and narrative evidence are shown to impact individuals' assessments of claims. However, facing complex health-related topics, laypeople usually lack expert knowledge to directly assess claim validity. Instead they need to consider the credibility of the claim's source. Accordingly they may assess evidence also in light of its origins. The present study aims to examine whether and how laypeople may link their understandings of evidence and of its source in order to make reasoned claim assessments. The study follows a 2x2 repeated-measures design with the within-participants factors source expertise and evidence type. In each condition undergraduates with low prior topic knowledge read an argument that consisted of a causal claim that was supported by either empirical or narrative evidence. Additionally each argument was said to be stated by either an expert or a layperson. Prior knowledge, claim credibility, claim agreement and source credibility are measured. The findings are analyzed regarding differences in assessments of claim credibility and source credibility depending on the interaction of evidence type and source expertise. Analogously differences in personal claim agreement are tested and related to credibility assessments. The findings contribute to current research which underscores the educational value for fostering individuals' science literacy as the means to evaluate both knowledge claims and their sources. Educational

implications will be deduced and discussed with regard to science education.

Do students' subjective theories agree with Boekaerts' Dual Processing Self-Regulation Model?

Keywords: Assessment methods and tools, Educational Psychology, Higher education, Self-regulation

Presenting Author: Sarah Grabler, Paris-Lodron University Salzburg, Austria; **Co-Author:** Jean-Luc Patry, University of Salzburg, Austria

In this paper the students' subjective theories about self-regulated learning when working on their Master's thesis will be compared with the Dual Processing Self-Regulation Model (DPSRM, Boekaerts, 2011). For most students, writing a Master's thesis is the first major piece of work which they have to do with only little support and supervision. Therefore, self-regulation is crucial to be successful. This can only be achieved if the students are aware of self-regulation principles, i.e., that they have concepts of self-regulation in their action-guiding subjective theories. In psychology and education, the DPSRM has been quite successful to account for such processes. The hypotheses state that (1) the elements in the students' subjective theories about the regulation of their work on the Master's thesis differ from those of the DPSRM and that (2) the relationships between these elements are comparable. The sample consisted of ten students in education who were working on their Master's thesis. This sample offers the possibility to investigate students at a very high level of self-regulation requirements and even students who have learned a lot about learning itself during their academic studies. The results show some correspondences and some differences between the core elements of the DPSRM and the students' subjective theories of. The students have a clear picture of the Well-Being Pathway and Growth Pathway in their subjective theories. Conclusions are that training students for their Master's thesis using Boekaerts' model might consist in further developing and differentiating their previous concepts.

Challenges of student leaders as facilitators in learning communities

Keywords: Communities of learners, Cooperative / collaborative learning, Out-of-school learning, Social interaction

Presenting Author: Spencer Carlson, Northwestern University, United States; **Presenting Author:** Daniel Rees Lewis, Northwestern University, United States; **Co-Author:** Matthew Easterday, Northwestern University, United States; **Co-Author:** Elizabeth Gerber, Northwestern University, United States

In schools, teacher-led learning communities (LCs) simulate communities of practice to provide students authentic experiences learning disciplinary practices. Undergraduate, student-led LCs might also enable student-leaders to develop leadership skills needed to participate in professional communities of practice. However, there is a paucity of research on student-led LCs. For student-led LCs to teach disciplinary abilities, student-leaders must diffuse—persuade and teach peers to use—new practices. How do student-leaders diffuse new practices in student-led LCs? In this ethnographic case study, we examined student-leaders' attempts to diffuse a professional project management practice in a student-led LC developed to teach design innovation project teams. To promote team progress, student-leaders introduced a new practice of brief weekly project updates so teams would plan, reflect, and seek help effectively. We analyzed leaders' diffusion attempt using a framework based on Rogers' (2003) model of diffusion of innovations, which we augmented with codes from Cialdini and Goldstein's (2004) review of factors that create social influence. We found student-leaders struggled to diffuse the project updates practice because they did not know how to persuade and teach peers to use it. Furthermore, while student-leaders capitalized on social influence to get teams to do project updates, teams also influenced leaders to abandon project updates by voicing negative opinions about the practice. By integrating these findings, we contribute a new causal model for understanding diffusion practices in student-led LCs that identifies key factors we must address to design student-led LCs that teach both disciplinary and leadership practices.

Combining campus education with a MOOC: the case of an Innovation Management course

Keywords: Case studies, E-learning / Online learning, Educational Psychology, Self-regulation

Presenting Author: Bas Giesbers, Rotterdam School of Management, Erasmus University, Netherlands; **Co-Author:** Serge Rijsdijk, Delft University of Technology, Netherlands; **Co-Author:** Sandra Langeveld, Rotterdam School of Management, Erasmus University, Netherlands

We investigated student evaluations and self-regulated learning ($N = 158$) in the context of a blended BSc course on Innovation Management, which combined campus education with a MOOC. Initial results show that there are no

differences in student performance compared to the previous instance of the course. Though students seem quite satisfied with the course, the perceived level of self-regulation is both seen as a merit as well as a threat to learning in such a blended context. Other points for improvement concern the quality of the learning material (namely the quality of narration in some of the videos), and the amount and quality of interaction with teachers and fellow students. The level of self-regulation seems not to have a large influence, though further analysis still is required.

Student Perspectives on the Transition to Proof in Collegiate Mathematics

Keywords: Argumentation, Higher education, Mathematics, Qualitative methods

Presenting Author: Mariana Levin, Western Michigan University, United States; **Co-Author:** John P. Smith, III, Michigan State University, United States; **Co-Author:** Younggon Bae, Michigan State University, United States; **Co-Author:** V. Rani Satyam, Michigan State University, United States

We report a qualitative analysis of 14 undergraduate students' experience in a semester long introduction to proof course in the United States. Half were mathematics majors. Our research aims to characterize, conceptually and empirically, students' transition from a focus on computation to proof in mathematics. Our analysis focused on how students saw the course as different from prior courses, how they described their work in it, and whether being successful in the course required new or different learning activity of them. This approach—targeting students' overall experience of the course—differs from prior research that has tracked students' challenges, focused on their work on specific proof problems, and explored how to support and improve their work (e.g., Selden & Selden, 2003). Our work has promise for informing the design of transition to proof courses and how those courses are organized and taught.

Emotional/moral episodes in university teaching: authenticity, authority, respect and loyalty

Keywords: Case studies, Emotion and affect, Higher education, Motivation and emotion

Presenting Author: Kathleen M. Quinlan, University of Kent, United Kingdom

Although teaching is emotionally and ethically demanding, university teachers' emotions and sense of moral purpose are under-researched. Assuming that teachers' emotions are bound up with their moral purposes, this study investigates emotional/moral episodes in university teaching. The study draws on Graham, Nosek, Haidt, Iyer, & Ditto (2011) moral foundations theory which posits that there are five main moral concerns found across cultures: Harm/Care, Fairness/Reciprocity, Ingroup/Loyalty, Authority/Respect, and Purity/Sanctity. There has been disproportionate attention to concerns related to Care/Harm and to Fairness/Reciprocity in existing literature in moral psychology. Moral foundations theory, therefore, expands research attention to include questions about Ingroups/Loyalty (to country, family and ingroups, which is vital for research on prejudice and identity), Authority/Respect (concerned with traditions, hierarchies, social roles and order), and Purity/Sanctity (concerned with standards of purity, decency, chastity, natural laws, disgust) as part of the moral realm. This paper examines a subset of 18 case examples of university teachers' moral/emotional moments (written as emotionally evocative poems) that deal with authority/respect (n=8), ingroups/loyalty (n=6), or a combination of these two (n=4), drawn from a larger sample of 66 case examples of emotions in university teaching. This pairing of two moral concerns was the most frequent combination found in the larger set, suggesting its importance to the practice of university teaching. These particular moral concerns are also important insofar as identity and respect are central to authentic leadership, a key element in supporting students' holistic development in higher education.

Task dependency of citizenship entitlement through education for responsible research and innovation

Keywords: Citizenship education, Morality, Quasi-experimental research, Science education

Presenting Author: Eleni Kyza, Cyprus University of Technology, Cyprus; **Co-Author:** Yiannis Georgiou, Cyprus University of Technology, Cyprus; **Co-Author:** Andreas Hadjichambis, Cyprus Center for Environmental Research & Education, Cyprus; **Co-Author:** Andria Agesilaou, Cyprus University of Technology, Cyprus

Moral reasoning is a crucial aspect of citizenship education and can contribute to the development of democratic citizenry. Nonetheless, little empirical research exists investigating secondary school students' moral reasoning. This study seeks to contribute to this gap, by examining the task dependency of moral reasoning in two different disciplines (chemistry, biology) at two education levels (lower and upper secondary education). A quasi-experimental design was adopted to investigate task dependency. Four-hundred and seventy-five students participated in this study. The intervention students (n=280)

used materials on complex, socio-scientific issues, which raised opportunities for highlighting and discussing the ethical, societal and scientific dimensions. The four sets of materials (one for each level and discipline) were developed by their teachers who worked in disciplinary co-design groups. The matched control students ($n=195$) did not use any of the new materials but were taught their standard curriculum. Students' moral reasoning was assessed using the validated Global Scientific Literacy Questionnaire (Mun et al., 2015) at two points in time. Statistical comparisons verified the equivalency of the two groups. Results after the implementations mainly indicated no or negative difference for the control group, and positive differences for the intervention students, which were, nonetheless, mediated by the context created by the learning materials. These results suggest that the development of moral reasoning is context-dependent. The analysis of the learning materials, in connection to these results, suggests design principles that can foster the development of moral reasoning in school contexts.

Environmental attitudes in parents and students – a cross-cultural comparison

Keywords: Attitudes and beliefs, Parental involvement in learning, Science education, Secondary data analysis

Presenting Author: Nina Roczen, German Institute for International Educational Research (DIPF), Germany; **Presenting Author:** Nina A. Jude, German Institute for International Educational Research (DIPF), Germany; **Co-Author:** Sonja Bayer, German Institute for International Educational Research (DIPF), Germany

Climate change is regarded as one of the central global challenges. To address this challenge, it is necessary to take action at the political and at the individual level. To advance behavior that aims at combating climate change, different preconditions of that behavior and their interrelations need to be understood. The Programme for International Student Assessment provides data to analyze these interrelations (considering both the family and the school perspective). Our analyses are built on PISA 2006 data from $N = 75.000$ students and parents from 16 countries. We consider questions addressing optimism, awareness and concern regarding environment-related issues as well as interest in the natural sciences. We examine whether these scales can be compared across countries. We furthermore test the anticipated structure of optimism, awareness, concern and interest in parents and students, respectively, using multi group structural equation modeling. Analyses of the intercultural invariance reveal that correlations may be compared between countries (metric invariance), however, it is not possible to compare mean values (scalar invariance). As regards the interplay between different environmental dispositions in parents and students, besides the already known positive correlation between students' and their parents' optimism as well as between interest and awareness and the negative correlation between students' awareness and their optimism, only small connections between students' and parents' optimism, awareness, concern and interest are found in most countries. By offering insights into the interplay between different environmental dispositions, we hope to provide information that helps to more effectively promote sustainable behavior in different contexts.

Assessing Moral Emotions and Moral Functioning - Moving beyond the Happy Victorizer Paradigm

Keywords: Emotion and affect, Mixed-method research, Morality, Motivation and emotion

Presenting Author: Eveline Gutzwiller-Helfenfinger, University of Teacher Education of Lucerne, Switzerland; **Co-Author:** Brigitte Latzko, University of Leipzig, Germany; **Co-Author:** Carmen Amrein, University of Teacher Education of Lucerne, Switzerland; **Co-Author:** Romy Schneider, University Leipzig, Germany; **Co-Author:** Lydia Küttner, University Leipzig, Germany; **Co-Author:** Anne-Mareike Möller, University of Leipzig, Germany

The present contribution discusses approaches for investigating moral emotions in adolescents and adults. Research on moral emotions and their development has followed several, often unrelated strands within various disciplines. In the developmental literature, one predominant approach has been the so-called Happy Victorizer Paradigm (HVP), encompassing the study of the relationship between moral rule knowledge and moral emotion attributions, mainly in young children. More recently, HV Research has been conducted with adolescents and adults, necessitating a re-consideration of the general measurement paradigm to explain the complexity of moral functioning in adolescence and adulthood. We discuss the need for (a) a developmentally appropriate, enriched measurement approach involving a more profound conceptualisation of the cognitive and emotional dimensions of morality as well as their interplay; and (b) the need of including the biological/physiological dimensions of moral experience and functioning in the context of naturalistic moral conflicts. We introduce two measurement approaches to address these considerations. The first relates to an enriched assessment of adolescents' moral functioning and was implemented in a qualitative interview study (study 1). The second approach focusses on physiological/biological dimensions in the context of naturalistic moral conflicts and is in preparation (study 2). By outlining the limitations of the predominant HVP, we discuss the potentials of enriched assessment methods allowing for a more holistic, developmentally appropriate measurement of adolescents' and adults' moral functioning. This is important for education and teacher education, as socio-moral and socio-emotional functioning has an impact on social relationships in the classroom and students' academic achievement.

Do Mathematically Skilled Adults Have a Sense for Irrational Numbers?

Keywords: Cognitive development, Cognitive skills, Mathematics, Numeracy

Presenting Author: Andreas Obersteiner, University of Education Freiburg, Germany; **Co-Author:** Veronika Hofreiter, Technical University of Munich, Germany

Number sense requires at least an ability to assess magnitude information represented by number symbols. Most educated adults are able to assess magnitude information of rational numbers fairly quickly, including whole numbers and fractions. It is to date unclear whether educated adults without training are able to assess magnitudes of irrational numbers, such as the cube root of 41. In a computerized experiment, we asked mathematically skilled adults to repeatedly choose the larger of two irrational numbers as quickly as possible. Participants were highly accurate when reasoning about the exact or approximate value of the irrational number components yielded the correct response. However, they performed at random chance level when these strategies were invalid and the problem required reasoning about the irrational number magnitudes as a whole. Response times suggested that participants hardly even tried to assess magnitudes of the irrational numbers as a whole. We conclude that even mathematically skilled adults struggle with quickly assessing magnitudes of irrational numbers in their symbolic notation. Without practice, number sense seems to be restricted to rational numbers.

Coherence in Pluralistic Societies and Public Education. A Framework Based on Rawls and Habermas

Keywords: Citizenship education, Reflective society, Religious studies, Values education

Presenting Author: Manfred L. Pirner, University of Erlangen-Nuremberg, Germany

The paper is based on the hypothesis that the question of social philosophy of “how citizens who remain deeply divided on religious, philosophical, and moral doctrines, can still maintain a just and stable democratic society” (John Rawls) corresponds with the question discussed in educational philosophy of how a consensus on major objectives of public education can be reached. It is demonstrated, how the two recently most influential social theories, those developed by John Rawls and Jürgen Habermas can provide guidelines for dealing with worldview and cultural diversity in the context of public education. Rawls’ concepts of “public reason” and “overlapping consensus” provide a framework for conceptualizing productive interrelationship between basic (‘thin’) political values, such as international human rights values, and strong (‘thick’) ethical values of particular worldview or religious communities that challenges and demands public education. With his concepts of “complementary learning processes” of religious and nonreligious citizens and inter-worldview “translations” Habermas further develops and concretizes Rawls’ ideas. Both philosophers’ vision of a pluralistic as opposed to a secularistic society and world can encourage the vision of pluralistic instead of secularistic public schools. On the basis of human rights values public education can be open to admit various worldview perspectives and promote critical as well as dialogical processes of learning from one another.

The Effect of an Integrated STEM Intervention on Attitudes towards STEM

Keywords: Attitudes and beliefs, Integrated learning, Quantitative methods, Quasi-experimental research

Presenting Author: Haydée De Loof, University of Antwerp, Belgium; **Co-Author:** Annemie Struyf, University of Antwerp, Belgium; **Co-Author:** Jelle Boeve-de Pauw, University of Antwerp, Belgium; **Co-Author:** Peter Van Petegem, University of Antwerp, Belgium

Despite the sufficient presence of students in STEM-oriented study programs in secondary education, few students are choosing STEM in higher education. Previous research has highlighted the importance of attitudes towards STEM when it comes to choosing a career or study. Research has demonstrated that an integrated approach to STEM-education could increase STEM-literacy, interest, and engagement. However, less attention has been given to attitudes towards STEM as an outcome measure. The goal of this study was to measure the effect of an integrated STEM intervention on attitudes towards STEM. The study involves a quasi-experimental design in which participants ($N = 979$, age = 14-15) attended secondary education in 38 different schools (26 experimental schools and 12 control schools). Outcomes were measured quantitatively through an online questionnaire using an adapted version of the validated PATT-survey, and the obtained data were analyzed relying on a multilevel approach. The multilevel analysis revealed that students in the experimental condition of integrated STEM-education reported more positive attitudes towards STEM than those in the control group. The effect sizes of type of STEM-education were medium to large. This study indicates that integrated STEM-education is an effective way to improve students’ attitudes towards STEM. Suggestions for future research are discussed.

Learning to know how many six are: a preschool intervention study about the relationship of numbers

Keywords: Design based research, Early childhood education, Numeracy, Phenomenography

Presenting Author: Camilla Björklund, University of Gothenburg, Sweden; **Presenting Author:** Angelika Kullberg, University of Gothenburg, Sweden

In this paper we report on results from a one-year intervention with preschool teachers trying to enhance children's knowledge of the first ten numbers and arithmetic skills. The aim of the research was to investigate preschool children's conception of number(s) and how these can be developed through participating in a theoretically driven pedagogical approach. Here we build on previous research and the idea that to avoid mathematics difficulties children need strategies that direct their attention to "manyness" of numbers and numbers' part-part-whole structure. The study consists of task-based interviews with 103 4-5-year-old children aiming to establish children's knowledge of numbers and strategies for arithmetic problem solving, and designed activities conducted by preschool teachers with 65 of the children during one preschool year. This particular paper focuses on the learning outcomes revealed among the participating children, e.g. how children experience the "manyness" of six and its part-part-whole relation before and after the intervention.

The impact of space on teaching - exploring ways to investigate teaching from a spatial perspective

Keywords: Attitudes and beliefs, Higher education, Qualitative methods, Teaching approaches

Presenting Author: Rie Troelsen, University of Southern Denmark, Denmark

Space works on its occupants and so both students and teachers are influenced by the physical contexts in which learning occurs. However, so far focus on the furnishing of classrooms (and built environment as a whole) in universities as being of importance to the student learning experience has not been overwhelming. In this paper findings from a small-scale research project are presented aiming at investigating the influence of spatial conditions on teachers' views on teaching and learning. The research method for this project builds on Lefebvre's (1991) spatial triad; the perceived, the conceived and the lived space. Semi-structured interviews with four teachers on their expectations, intentions and experiences with a certain learning space were conducted and as part of the interviews, the teachers were asked to describe the learning space by sketching it. Additionally, teaching situations in the learning space concerned was observed. The results show teachers including considerations on space in their planning and conducting of teaching. The four teachers interpret, however, the possibilities and limitations of the same space in very different ways. Some focus on the distribution between floor space and tables in the learning space while others focus on the space's technical devices as opposed to its whiteboards. The findings point to recommendations of creating ownership for teachers and students of a learning space and its resources in order to enhance teaching that uses the full potential of a given learning space.

Do Students' Understandings of Graduate Student Attributes align with Academics' Understandings?

Keywords: Attitudes and beliefs, Higher education, Qualitative methods, Student learning

Presenting Author: Heather Kanuka, University of Alberta, Canada; **Co-Author:** Samira ElAtia, University of Alberta, Canada; **Co-Author:** Summer Cowley, The University of Alberta, Canada; **Co-Author:** Jason Holmes, The University of Alberta, Canada

The purpose of this study was to gain insights on: (a) how academics and undergraduate students understand graduate student attributes and (b) the extent of agreement between undergraduate students and academics on attributes that are acquired in a university education. Using qualitative data collection techniques, this study conducted an open-ended interview with academics and students at a Canadian university ($n=40$). The results suggest that both students and academics have varied understandings of graduate student attributes. Academics in this study tended to believe that student attributes are useful in articulating the value of a university education, though most do not believe they can be measured as outcomes. Without evaluation and assessment data, most academics consider student attributes outside the scope of their mandate and expertise. Alternatively, the students tended to enthusiastically embrace the notion of attributes, believing their attributes are acquired as they progress through their undergraduate programmes. The differences observed between students and academics is important to note: (1) there is a rather wide range of differences in understandings of what student attributes are acquired in an undergraduate programme and (2) whether students acquire these attributes through the course of their programmes of study. Based on the findings of this study, future research needs to begin tackling the difficult issue of evaluating and assessing GSAs in Canada. Such a process might begin with a shared understanding of institutionally initiated GSAs with constructs that have clearly defined meanings and concrete examples of where, and how, GSAs are acquired in the curriculum.

Multi-drafting and procrastination in online learning among L1 and L2

Keywords: Higher education, Student learning, Technology, Writing / Literacy

Presenting Author:Miriam Sarid, Western Galilee College, Israel; **Co-Author:**Yehuda Peled, Western Galilee College, Israel; **Co-Author:**Vered Vaknin, Western Galilee College, Israel

The aim of the current research was to examine L1 and L2 college students' attitudes toward web-based method of learning (based multi-drafting) and the procrastination of academic assignments among Israeli Arab students for whom Hebrew is a second language (L2), compared with those of Israeli students for whose first language is Hebrew (L1). We assumed that on-line Multi-drafting would be more meaningful for students who study in a second language and are likely to have problems in the organization of discourse

Two hundred eighty-four college students participated in the study. Attitudes toward multi-drafting and procrastination were measured using self-report questionnaires.

Unexpectedly, results indicated that L1 are more likely to perceive on-line multi-drafting as a reasonable way of learning than L2 are, mainly in first-year of studies while L2 showed more positive attitudes toward on-line multi-drafting than did L1 in the second/third year. L2 procrastinated in the completion of tasks during their first year of study more than L1 did. The results suggest that in the first year of study L2 students face a language barrier and must adapt themselves to the new academic requirements of the college. Therefore, they cannot take advantage of on-line assistive devices (extra time or repeated submission of papers) to improve their grades.

Active learning methods in higher education (STEM): Systematic literature review

Keywords: Engineering, Higher education, Student learning, Teaching approaches

Presenting Author:Susanna Hartikainen, Tampere University of Technology, Finland; **Presenting Author:**Laura Pylväs, University of Tampere, Finland; **Co-Author:**Heta Rintala, Tampere University of Technology, Finland; **Co-Author:**Petri Nokelainen, Tampere University of Technology, Finland

This systematic literature review provides a current overview of the empirical research concerning active learning in the context of higher education. The study focuses on the EARLI domain of Learning and Instruction in higher education (SIG04) in the field of science, technology, engineering and mathematics (STEM). Active learning is a constructivist learning approach in which, instead of only absorbing knowledge from their teacher the students construct it themselves (Michael, 2006; Tynjälä, 1999; Prince & Felder, 2006). The growing focus on more general skills needed in the today's working life has challenged the higher education institutions to adopt and research new approaches to learning (Park & Choi, 2014; Tynjälä 1999). Altogether 82 peer-reviewed research articles (empirical qualitative and quantitative research) related to the research topic were chosen for complete reading. The initial results indicate that there is variety of different kinds of active learning methods or activities being used in STEM higher education and that in most of the cases active learning methods had a positive effect on student learning outcomes. STEM context in higher education where the traditions are on lecture-based methods, provide an interesting context to examine student learning outcomes in relation to active learning methods. The aim of the research is to provide new information and tools of active learning methods for practice but also to contribute for theoretical debate on new approaches to learning.

Evaluation of Complex Essay Writing Skills at Upper Secondary Level – Results from the MEWS study

Keywords: Language (Foreign and second), Second language acquisition, Secondary education, Writing / Literacy

Presenting Author:Oliver Meyer, University of Applied Sciences Northwestern Switzerland, Switzerland; **Presenting Author:**Maleika Krüger, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Stefan Keller, School of Teacher Education Basel, Switzerland

In this paper we present results from the MEWS project (Masuring English Writing at Secondary Level), a large-scale study of English writing competences currently in progress in Switzerland and Germany (N = approx. 3000; 11th school year). The presented data was collected at the first measurement point of this project, between September and November 2016 in Schleswig-Holstein (Germany) and in six cantons in Switzerland. Students were asked to respond to two composition tasks closely related to the writing section of the TOEFL test, representing an independent (argumentative essay) and an integrated writing task (summary of diverging arguments in a listening and a reading passage). Student responses were scored by two human raters on a 6-level holistic scale and, in addition, analyzed with „Automated Essay Evaluation“ (AEE). These analyses were conducted in co-operation with *Educational Testing Service* (ETS) in Princeton,

USA. Students were also tested on their reading, listening and cognitive skills and asked to answer a questionnaire about their family background and personality traits. In this paper, we show students' competence levels on the holistic scale and discuss the procedures in building the specific AEE evaluation model for this project. We also present some in-depth analyses of so-called "feature scores" concerning different aspects of learners' writing competences both for the independent and integrated writing tasks.

Student roles in effective and ineffective feedback

Keywords: Higher education, Learning approaches, Student learning, Survey Research

Presenting Author:David Boud, University of Technology Sydney/ Deakin University, Australia; **Co-Author:**Phillip Dawson, Deakin University, Australia; **Co-Author:**Michael Henderson, Monash University, Australia; **Co-Author:**Tracii Ryan, Monash University, Australia; **Co-Author:**Michael Phillips, Monash University, Australia

As a learning process, feedback is substantially dependent on what students do. Despite an extensive literature on feedback, including research into the effects of different types of feedback information on student performance, there is limited evidence on the student role in effective (or ineffective) feedback. We undertook a large-scale survey of students in two Australian universities and asked them to give examples in their very recent studies of feedback that was effective or ineffective. Responses were analysed against a framework derived from desirable roles of students identified in existing conceptual models of feedback. Most features of effective feedback were present to some extent in our data; however ineffective feedback was often characterised by poor quality feedback information or designs that inhibited students from taking on these effective roles. This study provides empirical support to existing conceptual models, such as Feedback Mark 2 and sustainable feedback.

Examining Dimensionality in Word Problem Performance and Difficulty of Word Problem Types

Keywords: Cognitive skills, Mathematics, Problem solving, Quantitative methods

Presenting Author:Nonmanut Pongsakdi, University of Turku, Finland; **Co-Author:**Anu Kajamies, University of Turku, Finland; **Co-Author:**Koen Veermans, University of Turku, Finland; **Co-Author:**Minna Hannula-Sormunen, University of Turku, Finland; **Co-Author:**Kalle Lertola, University of Turku, Finland; **Co-Author:**Marja Vauras, University of Turku, Finland; **Co-Author:**Erno Lehtinen, University of Turku, Finland

For many students, word problems are notoriously challenging to solve. In attempts to understand students' difficulties in solving word problems, several cognitive models that identify (required) processes that explain successful performance have been proposed. These models indicate that the processes of solving regular word problems require students to use not only mathematical skills, but also other cognitive skills (e.g., reading comprehension). In some of the more challenging word problems, students also need to apply realistic reasoning in the modeling process. Based on these models, it seems reasonable to assume that students' performance on word problems can be considered as multidimensional constructs, and difficulty level of word problems depends on how complex the cognitive skills required to use. The aim of the present set of studies was to (1) test hypotheses concerning dimensionality of students' performance on word problems, and (2) assess (order of) difficulty of three types of word problems: routine, non-routine, and application word problems by using item response theory (IRT) modeling. Surprisingly, tests of unidimensionality indicate that students' performance on word problems can be explained by one-dimensional construct. Moreover, the results of IRT model do not show a clear distinction among word problem types, and reject the hypothesis that the application word problems, theoretically demanding more complex solution processes, have a higher difficulty level than non-routine word problems.

Assessment and feedback in Higher Education: Findings from an empirical study in Portugal

Keywords: Assessment methods and tools, Higher education, Learning approaches, Self-regulation

Presenting Author:Diana Pereira, University of Minho, Portugal; **Co-Author:**Maria A. Flores, University of Minho, Portugal; **Co-Author:**Ana Veiga Simão, Faculty of Psychology, University of Lisbon, Portugal; **Co-Author:**Alexandra Barros, University of Lisbon, Portugal

This paper draws upon a broader piece of research on assessment in higher education, particularly focusing on issues regarding the fairness and effectiveness of the assessment methods and their implications for the learning process and the students' perceptions of the effectiveness and relevance of feedback in regard to assessment methods and self-regulation of learning. In total, 624 students participated in this study in five Portuguese Public Universities in different areas of knowledge and programmes. Data were collected through questionnaires. Findings suggest that assessment is seen as more effective and fairer when it is done through the use of learner-centred assessment methods rather than by traditional assessment (e.g. written tests or exams). The students also claim that they devote more time to study when assessment is performed through learner-centred assessment methods than by traditional ones. The most used assessment methods are written tests and oral presentations in group. Regarding feedback results revealed that feedback is perceived as more relevant, effective and in a more positive way by students who are assessed through learner-centred methods than by those assessed through traditional methods. Also, participants who are assessed through learner-centred methods or mixed methods perceived feedback as more effective in all phases of self-regulation learning than students who are assessed through traditional methods. Implications of the findings regarding assessment and feedback in Higher Education are discussed.

Embedding Literacy in Initial Teacher Education

Keywords: Literacy, Pre-service teacher education, Synergies between learning - teaching and research, Teacher Professional Development

Presenting Author:Kirsten Hutchison, Deakin University, Australia; **Co-Author:**Anne Cloonan, Deakin University, Australia; **Co-Author:**Louise Paatsch, Deakin University, Australia; **Co-Author:**Glenn Auld, Deakin University, Australia; **Co-Author:**Maria Nicholas, Deakin University, Australia; **Co-Author:**Andrew Eyers, Deakin University, Australia; **Co-Author:**Angela McNiven, Deakin University, Australia

Despite evidence that integration of theoretical and practical knowledge is essential to effective Initial Teacher Education (ITE), 'business as usual' in ITE continues to reinforce a theory-practice divide, with disciplinary studies predominantly located in universities and professional experience of teaching located in schools. The presentation addresses this crucial issue by exploring potentials and challenges of school-based ITE in literacy education and collaborative inquiry into literacy teaching and research between academics, teachers and Pre Service Teachers (PSTs). In Australia, preparation for literacy teaching has been identified as a particular concern by some stakeholders (National Inquiry into the Teaching of Literacy, 2005). As a relatively new area of research, evidence about the effectiveness of various ITE teaching practices is limited, with concerns regarding graduate teachers' capacities to design and implement research informed practices. With notions of effective literacy education changing to encompass traditional print and formal literacies required for schooling, together with understandings of the literacies entailed in engagement with digital cultures for increasingly diverse learners, this is a complex area. This project reports on research into renewed notions of literacy curriculum and pedagogy through innovative school based approaches to teacher education that align ITE with areas of school improvement and practitioner research.

Designing and evaluating content of physics instruction: Conceptual groundings of electric field

Keywords: Cognitive development, Pre-service teacher education, Science education, Teaching / instruction

Presenting Author:Terhi Mäntylä, University of Tampere, Finland; **Co-Author:**Maija Nousiainen, University of Helsinki, Finland

Electric field is an abstract and complex scientific concept, which is important to understand in the university physics. However, research has shown that the field concept is problematic and difficult to learn. In this study, we first introduce three conceptual groundings called force, energy and source grounding concerning electric field concept for purposes of gaining more coherent and organized view of the electric field concept. Then, the learning results of pre-service physics teachers' understanding of the conceptual development of electric field concept are discussed. The results are based on the content analysis of nodes and links of the pre-service teachers' concept networks presenting the development of electric field concept within and between the three groundings. Further, the connectivities of the pre-service teachers' concept networks was calculated based on the content analysis categories. The results show that students are most familiar with the force grounding and it forms a basis of introducing other groundings. The approach using conceptual groundings gives students structured surroundings in learning the various aspects and complexity of the electric field concept.

Mentor teacher's interventions during student teacher's lessons: Can we predict these?

Keywords: Pre-service teacher education, Primary education, Reasoning, Teacher Professional Development

Presenting Author:Frans Prins, Utrecht University, Netherlands; **Co-Author:**Marieke Jaspers, Utrecht University, Netherlands; **Co-Author:**Paulien Meijer, Radboud University Nijmegen, Netherlands; **Co-Author:**Theo Wubbels, Utrecht University, Netherlands

Abstract Recent studies showed that during student teachers' (STs') lessons, mentor teachers (MTs) intervene quite frequently, mainly by guiding the pupils. Fenstermachers' *practical argument*, consisting of situational, value, and empirical premises, and an intended or actual action (1986), was used to describe mentor teachers' reasoning process for their intervening. In the present study we examined the impact of the situational, value and empirical premises on MTs' intensity and target of intervening during student teachers' lessons. A total of 159 MTs participated in our study. MTs indicated for 12 vignettes, describing ST's teaching MT's pupils and in which the ordinary course of events is interrupted, their intention to intervene (or not). MTs' value and empirical premises were measured with a questionnaire. We analyzed the impact of situational premises (STs' study year, trigger type and trigger degree), value and empirical premises on MTs' intensity and

target (pupil or ST) to intervene. Results showed that STs' years of study, as well as the type and degree of the trigger impacted MTs' intensity and target to intervene. Additionally, MTs' values and empirical premises influenced MTs' intensity to intervene, but not the target. We conclude that MTs' intentions to intervene and the reasons for doing so might be explained by their ingrained habit as teacher of intervening to pupils, and by MTs' unawareness of their mentor role and STs' learning. When MTs become aware of their mentor role and of STs' learning, their ST guidance might improve, which might be beneficial to STs' development.

Pre-service students' reading trajectories

Keywords: Literacy, Pre-service teacher education, Student learning, Lifelong learning

Presenting Author: Anna-Karin Svensson, Malmö University, Sweden

Pre-service students reading trajectories *Anna-Karin Svensson Malmö University, Sweden*
Abstract The present work is an in-depth study of four pre-service teachers own experience of reading in different contexts and for different reasons. The aim is to analyze what the students express as significant on reading in a life history perspective by the use of narratives. The following questions were asked: · What aspects are expressed as significant in the students' narratives in a life perspective, from early reading to the encounter with reading in teacher education? · What aspects are expressed as significant in the narratives of the students' reading during their reading in teacher education? Initial pre-service students' narratives are analyzed in this study. A social-cultural perspective on reading is used in the narrative analysis. The analysis resulted in a description of the students' reading trajectories. As an over- arching result, the students' narratives revealed that reading is a relational process regardless of context and stage of life. In every context in a life perspective reading occurs with significant others. Significant others seems important in every literacy context from new readers in primary school to pre-service teachers' reading in teacher education. **Keywords;** narratives, pre-service teachers, reading contexts, reading trajectories, significant others

Symposium

Cognitive Science, Learning and Instructional Technology, Motivational, Social and Affective Processes

Analyzing and visualizing the dynamic aspects of affect and cognition across contexts

Keywords: Artificial intelligence, Emotion and affect, Interdisciplinary, Learning analytics, Learning Technologies, Metacognition, Multimedia learning, Self-regulation, Social aspects of learning and teaching

Interest group: SIG 27 - Online Measures of Learning Processes

Chairperson: Roger Azevedo, North Carolina State University, United States

Chairperson: Julien Mercier, Canada

Discussant: Reinhard Pekrun, Ludwig-Maximilians-Universität (LMU), Germany

Learning can be attributed to the cumulative effect of temporally fine-grained affective and cognitive events occurring over longer learning episodes. Optimizing learning efforts, for example by better pedagogical design or by improving learners' metacognitive skills, requires causal explanations linking learning with cognition and affect in correspondence with the rate of change of those processes. Current research on learning processes is severely limited by incomplete data of learners' cognitive processes and affective states that are contingent on context-specific factors (e.g., problem complexity, time constraints, situation dynamics, and external regulating agents). Participants in this symposium are invited to present an empirical study on the theme of "online measures of learning" which could contribute theoretical or methodological advances to an emerging research program oriented towards the concomitant behavioral and psychophysiological modeling of cognitive and affective aspects of learning in increasingly authentic contexts. The four presentations constituting this symposium address this issue by proposing theoretical frameworks, types of data, strategies for data analysis as well as technical tools to analyse and visualize process-oriented data about learning. This collection of work provides new insights regarding the notion that learners interact dynamically with aspects of the learning situation, such as the learning task itself, as well as with other agents such as co-learners or intelligent virtual humans. This fine-grained information will enhance our conceptual and theoretical understanding of learners' affect and cognition and subsequently provide evidence for optimizing learning across contexts.

Cognitive Metacognitive and Affective Processes during Learning with an Intelligent Virtual Human

Presenting Author: Roger Azevedo, North Carolina State University, United States; **Co-Author:** Nicholas Mudrick, North Carolina State University, United States; **Co-Author:** Michelle Taub, North Carolina State University, United States; **Co-Author:** Garrett C. Millar, North Carolina State University, United States; **Co-Author:** Amanda E. Bradbury, North Carolina State University, United States; **Co-Author:** Megan J. Price, North Carolina State University, United States

The evolution of learning technologies has led to the use of intelligent virtual humans (IVHs) to facilitate problem solving, reasoning, and learning across domains. Despite results in rapport building, cultural training, and informal science learning, IVHs have not been used to support learners' cognitive, affective, and metacognitive (CAM) self-regulation during multimedia learning. The objective of this study was to investigate how an IVH, capable of facially expressing emotions (e.g., confusion, joy, neutral), can trigger learners' ability to monitor and regulate their CAM self-regulatory processes and

therefore enhance their science learning with multimedia. Evidence from multichannel data (e.g., log files, eye tracking, facial expressions of emotion, physiological data, and screen capture of learner-system interactions) analyses indicates that the IVH's facial expressions triggered monitoring of students' CAM SRL processes during complex science learning with multimedia materials.

How physiological data visualizations can be used to track socially shared regulation of learning

Presenting Author:Jonna Malmberg, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Ilkka Juuso, University of Oulu, Finland; **Co-Author:**Iman Alikhani, University of Oulu, Finland; **Co-Author:**Tapio Seppänen, University of Oulu, Finland

A core of collaboration is a construction of shared understanding through interaction with others, where the participants are committed to or engaged in shared goals and problem solving. Learners also need to engage in socially shared regulation of learning (SSRL) to progress in their collaboration. What triggers socially shared regulation to occur is a result of individual monitoring, which is often invisible, but can be shared with the group members in a social plane. As a result of individual monitoring, learners have increased possibilities to change the course of their learning by engaging in regulation of cognition, motivation, emotions or behavior as a shared activity. New technological solutions on data collection and visualizations has opened up new ways to characterize the core mechanisms of SRL which are often invisible, and, therefore difficult to capture. In this study we explore how physiological data visualizations of one case group, that combines videodata codings on individual learners metacognitive monitoring and their physiological signals of affective reactions can be used to track socially shared regulation of learning in an authentic and challenging collaborative learning situation.

Visualizations to support Self Regulated Learning based on data from Adaptive Education Technologies

Presenting Author:Inge Molenaar, Radboud University Nijmegen, Netherlands

Many students in primary education regularly learn using adaptive educational technologies (AET) on tablets. Driven by developments in the emerging field of learning analytics, these technologies successfully adjust instructional events (instructional texts, assignments, tools) to learners' performance. Hence AETs support learning efficiency, but it is unclear how AETs influence learner effort, emotion and related learning effectiveness. An important concern is that AETs eliminate the need for learners to regulate their own learning. Research showed that learners' control and monitoring activities are an important driver for learner effort, which is essential for retention and transfer of knowledge (learning effectiveness). Thus adaptive learning technologies enable efficient learning, but are likely to be detrimental to learner effort, and consequently effectiveness. At the same time AETs gather vast amounts of data that can be used to support learners. In this contribution, I discuss how visualizations can be established using data from AETS and how this supports learners' self-regulated learning. The visualizations are specifically designed to adjust learner effort and to support learners to effectively regulate their own learning.

Conceptual & methodological challenges in studying the interplay of affect and cognition in learning

Presenting Author:Julien Mercier, University of Quebec (Montreal), Canada; **Co-Author:**Pierre Chalfoun, User Research Lab – Ubisoft Montreal, Canada; **Co-Author:**Babak Khosravifar, University of Quebec in Montreal, Canada; **Co-Author:**Kamran Shaikh, University of Quebec in Montreal, Canada

Learning involves cognitive and affective processes unfolding moment by moment over the entire activity. However, traditional data such as observations and self-report measures are not sufficient to accurately model how cognition and affect unfold in time. Self-report measures cannot be administered according to the rate of change of constructs of interest, while concurrent verbalizations are incomplete and can impede learning performance. To more fully explain the requirements for a successful learning episode, ways to measure and link those processes over time are needed, accompanied by an appropriate modeling of the learning context, which can also be seen as dynamic. The goal of this presentation is to illustrate an innovative cross-disciplinary methodology to measure aspects of affect and cognition as they unfold in time during an initial episode of play with a video game, which aims specifically at developing a minimal level of mastery of the game's various mechanics (combat, economy, etc.) while keeping the learner engaged in the activity at hand. The suggested methodology should inform the selection of appropriate constructs, provide adequate definitions and operationalisations, and enable the empirical study of how affect and cognition fluctuate over time and how they interact dynamically during learning efforts. Appropriate formalism for pertinent fixed and dynamic features of the context are also needed. The characterization of learning as the dynamic interplay of affect and cognition in a changing context that this approach should make possible could inform the design of multiple contexts of learning, including entertainment and education.

Symposium

Cognitive Science

The number line revisited: new insights into strategy use and training

Keywords: Cognitive development, Cognitive skills, Game-based learning, Mathematics, Numeracy

Interest group:

Chairperson: Anne van Hoogmoed, University of Groningen, Netherlands

Discussant: Evelyn Kroesbergen, Utrecht University, Netherlands

In the last decades, researchers have shown an increasing interest in number line estimation (NLE) and its development with age. Whereas much of this research has focused on performance on the NLE task, less attention has been paid to strategies used in NLE. New knowledge on strategy use can deepen our understanding of number processing in children and lead to new trainings and interventions using the number line. The current symposium will contribute to our knowledge of both strategy use and training in NLE. The first two papers by Simms et al. and Baten et al. will discuss strategies used in NLE by children. Both papers show that strategies can be promoted by specific instructions and labeling benchmarks. The third paper by Van Hoogmoed and Kroesbergen will discuss strategy use on different types of number lines in individuals with and without mathematical learning disability (MLD). This will give insight into which specific instructions may help those with MLD in number line estimations. The last contribution by Ninaus et al. will discuss the use of a game-based NLE task to assess knowledge of fractions. The papers will be discussed by Evelyn Kroesbergen, a well-known researcher in the area of number line estimations. Together, the contributions expand our knowledge on how individuals represent and process numbers. This can serve as a base for further research into applications of number lines to train components of mathematics, both at the lower level of number sense as well as the higher level of understanding fractions.

Number Line Estimations: An exploration of children's response strategies

Presenting Author: Victoria Simms, Ulster University, United Kingdom; **Co-Author:** John Towse, Lancaster University, United Kingdom; **Co-Author:** Kevin Muldoon, Herriot Watt University, United Kingdom

Research into number line estimation is burgeoning. Whilst most research focuses on estimation as a response, we consider the underlying process that yields response patterns. Twenty-eight children (mean age 73 months) completed both a 0-10 and 0-20 number line estimation task. We identified three entry point strategies that children spontaneously exhibit when making estimations; that is, the position on the number line where they first make a move from in order to give their response. We then examine children's flexibility by modelling the two most common of these strategies in a set of multiple task sessions over the course of a day. The data confirm the prevalence and frequency distribution of two spontaneous response strategies. Our interventions also confirm that these need not be immutable; we find that for different estimation ranges children do sometimes change their strategy having merely seen another use it. We conclude that number line estimations must be mediated by performance strategies as well as children's knowledge of the number system.

The effect of labeled benchmarks on number line estimations

Presenting Author: Elke Sekeris, KU Leuven, Belgium; **Co-Author:** Dominique Peeters, KU LEUVEN, Belgium; **Co-Author:** Lieven Verschaffel, KU Leuven, Belgium; **Co-Author:** Koen Luwel, KU Leuven, Belgium

Number line estimation (NLE) studies have shown that children can use benchmarks to position numbers on a number line (Barth & Paladino, 2011). Peeters et al. (2016) however demonstrated that the provision of additional benchmarks at 25% and 75% of the number line did not lead to better NLE performance in young children. In the present study we investigated whether labeling benchmarks (i.e. giving a numeric label to the benchmark) has an effect on children's NLE accuracy and benchmark-based strategy use, and whether this differs between grades. Eighty-three third graders and 72 sixth graders were randomly assigned to one of three conditions: (a) a *control* condition with labeled benchmarks at the origin (0) and endpoint (1000), (b) an *unlabeled* condition with additional unlabeled benchmarks at 25%, 50% and 75% of the number line, and (c) a *labeled* condition in which these benchmarks were labeled with, respectively, 250, 500 and 750. Findings showed that third graders estimated more accurately in the labeled condition than in the unlabeled one, while the estimation accuracy of sixth graders did not differ between these two conditions. Trial-by-trial verbal reports and model fits showed that the majority of third graders were fitted best with the four-cycle power model (i.e. using benchmarks at 25% and 75%) in the labeled condition only. Whereas the majority of sixth graders fitted best with this model in both the unlabeled and labeled condition. These findings have implications for the amount of support that should be provided to children learning NLE.

Strategy use in bounded and unbounded number lines in MLD

Presenting Author: Anne van Hoogmoed, University of Groningen, Netherlands; **Co-Author:** Evelyn Kroesbergen, Utrecht University, Netherlands

Number line estimation (NLE) tasks typically measure number placements on a bounded number line. Recently, the unbounded NLE task was introduced in which only the starting point of the number line and unit are given, but no endpoint. This type of task is thought to be a more direct measure of understanding numerical quantity. Performance, development, and strategy use differ between the bounded and unbounded NLE tasks in the general population. Research has shown that individuals with mathematical learning disability (MLD) lag behind in bounded NLE tasks. In the current research, we examined whether they also lag behind in the unbounded NLE task and whether they use different strategies as compared to individuals without MLD. In the first qualitative study, four strategies were identified for estimations on the unbounded NLE task. These strategies were used by adults with and without MLD. In the second study, performance and strategy use of children with and without MLD on the unbounded number line is compared. The results of these studies give additional

insights into the deficits in adults and children with MLD and possible strategies that may improve their number line estimations.

Using a game-based number line estimation task to assess conceptual fraction knowledge

Presenting Author:Korbinian Moeller, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**manuel Ninaus, Leibniz-Institut für Wissensmedien (IWM), Germany; **Co-Author:**Kristian Kiili, Tampere University of Technology, Finland; **Co-Author:**Jake McMullen, University of Turku, Finland

Serious games gain increasing research interest as tools to augment traditional instructional approaches on scholastic learning, especially in mathematics education. In the present study, we investigated whether a game-based approach may not only be useful to foster numerical learning but may also be valid as an assessment tool. Thus, a total of 54 Finnish fifth graders played a math game on tablet computers using tilt-control to maneuver an avatar along a number line for 30 minutes. Findings indicated that hallmark effects of fraction magnitude processing typically observed in basic research, such as the numerical distance effect, were successfully replicated using the game-based assessment. Moreover, in-game performance measures, such as fraction comparison performance as well as fraction estimation accuracy, correlated significantly with students' math grades. The results of the current study, thus, suggest that game-based learning environments for fraction education (even using tilt-control) also allow for a valid assessment of students' fraction knowledge.

Symposium

Higher Education

Research competence as part of scientific thinking in university education

Keywords: Higher education, Misconceptions, Researcher education, Student learning

Interest group: SIG 04 - Higher Education

Chairperson: Tuike Iiskala, University of Turku, Finland

Discussant: Heidi Hyytinen, University of Helsinki, Finland

University education aims at high quality thinking skills that aid students in their future working life. University students are, however, found to have various problems in their learning of these higher order thinking skills, especially on research methodology courses. This symposium focuses on students' learning of research competence and asks whether we have suitable theories for explaining students' development of higher order thinking skills. Our central claim to be discussed in the symposium is that the prior theories, such as the traditional theory of scientific thinking, critical thinking and epistemic beliefs, are too narrow alone in describing the breadth of higher order thinking skills needed in higher education. On the basis of the research findings of the individual papers, this symposium suggests that scientific thinking should be redefined for the purposes of higher education by including research competency and the theories of critical thinking and epistemic beliefs, and the traditional theory of scientific thinking. In addition we state that research education should not just cover the teaching of specific methods, but instead focus more on students' understanding of the "big picture" of research.

Undergraduates' Conceptions of Research Methods Learning

Presenting Author:Kieran Balloo, University of Roehampton, United Kingdom

A range of conceptions held about research methods learning have previously been identified. The current study aimed to examine in-depth shared conceptions among groups of undergraduate students, since individual conceptions are unlikely to exist in isolation. Utilising Q methodology, which links both quantitative and qualitative methodologies to uncover the subjective viewpoints that a group of individuals hold towards a particular domain, participants ranked statements reflecting different conceptions of research methods learning. Ranks were then factor analysed and seven distinct profiles of student conceptions were identified, labelled and described in qualitative detail: *Big Picture Students (Aspiring Researchers)*, *Big Picture Students (Non-Aspiring Researchers)*, *Other-Focused and Superficial Learners*, *Calm and Dismissive Learner vs. Anxious and Concerned Learner*, *Unconvinced Students vs. Converted Student*, *Side-choosing Researchers*, and *Relaxed and Reductionist Learners*. A significant association was found between these profiles and the students' year of study; final year students displayed more 'big picture' views of research, while first year students showed a more superficial understanding. There was also a significant association between profiles and performance on research assignments; students who exemplified 'big picture' narratives performed better than those who exhibited superficial perspectives. Findings are considered in terms of how some conceptions take longer to develop and appear to be more beneficial or problematic to hold than others.

First Year College Students' Emerging Understandings of Evidence

Presenting Author:Kieran Balloo, University of Roehampton, United Kingdom; **Co-Author:**Rebecca Shargel, Towson University, United States; **Co-Author:**Lisa Twiss, Towson University, United States

This qualitative research study examines first year college students' abilities to think critically in a large state university in the United States. By emphasizing a typology of evidence that includes both quantitative and qualitative research as

evidence, we track students' growth over the course of the semester to see in what ways their thinking develops. Findings included an increase in sophistication in preparing a research paper that included critically evaluating sources, combining types of evidence, increased skepticism towards online information, particularly social media sources. Most importantly, students shifted from seeing information as a commodity to be consumed, to them producing accurate information. This study adds to the field by examining students' perspectives on critical thinking and also shedding light on the complex process of teaching students to view information through more critical eyes.

Teacher education students' conceptions of theory

Presenting Author:Margaret Kiley, Australian National University, Australia; **Co-Author:**Heidi Salmento, University of Turku, Finland

Some University students have problems with understanding the concept of theory. This study explored teacher education students' conceptions of theory at the beginning and at the end of their five year master's education. In this study, 127 students' conceptions of theory were analysed and a six-category model of conceptions was created. The categories were named as (1) *Conceptions of theory as explaining practice*, (2) *Conceptions of theory as modelling phenomena*, (3) *Conceptions of theory related to research*, (4) *Subjective conceptions of theory*, (5) *Conceptions of theory as a fact or truth* and (6) *Conceptions of theory as separate from practice*. When comparing the student groups, first year student saw theory more often as explaining practise and as a fact or truth, while more advanced students saw theory as modelling phenomena and being related to research.

Towards a theory of scientific thinking in higher education including research competence

Presenting Author:Mari Murtonen, University of Turku, Finland

Development of higher order thinking skills is an important goal in university education. The question about higher order thinking skills has been studied, for example, under the concepts of scientific thinking, reasoning, critical thinking, and epistemological beliefs. We wanted to explore the question of higher order thinking skills from the perspective of students and teachers by asking them what they think scientific thinking is. University teachers ($N = 37$) and students ($N = 80$) in various disciplines answered the research question. On the basis of their answers, eight categories were formed: broad thinking, basic principles of science, discipline based world view, research skills, reasoning skills, generic skills, epistemic beliefs and technical view. The results expressed both contents of the former theories of higher order thinking skills, but also new, very important aspects, such as research skills. The results thus propose a new, wider theory of scientific thinking for the purposes of higher education that includes research competence in addition to the traditional natural science based scientific thinking and critical thinking factors.

Symposium

Understanding variability in math anxiety and its impact on math performance

Keywords: Achievement, Cognitive skills, Game-based learning, Mathematics, Motivation and emotion, Pre-service teacher education, Secondary education

Interest group:

Chairperson: Delphine Sasanguie, KU LEUVEN, Belgium

Discussant: Kinga Morsanyi, Queen's University Belfast, United Kingdom

Math anxiety (MA) and math performance are negatively associated (e.g., Hembree, 1990; Ma, 1999). However, evidence for the direction of this link is mixed. Variable results could be due to the fact that MA consists of different components and is related to other forms of anxiety (Dowker, Sarkar, & Looi, 2016). This symposium aims to address how MA and math performance are interrelated, when taking MA components and the specificity of MA into account. Paper 1 discusses the relation between implicit versus explicit MA and math performance and contrasts these types of MA to implicit and explicit English anxiety and trait anxiety. Paper 2 further illustrates that children with specifically elevated anxiety about math and tests performed worse on math and reading tests compared to those who had elevated MA and test anxiety alongside general anxieties. Paper 3 provides insight in the relation between the cognitive versus affective component of MA and math didactics in pre-service preschool teachers. Finally, Paper 4 addresses the causal link between MA and math performance with an intervention study in which children were trained with a math game. Together these papers provide insights into the different components and interrelations between MA and other forms of anxiety on the one hand and math performance on the other – information that is crucial with regards to the development of (educational) interventions.

Investigation of the specificity of math anxiety, using both implicit and explicit measures

Presenting Author:Eva Schmitz, University of Amsterdam, Netherlands; **Co-Author:**Brenda Jansen, University of Amsterdam, Netherlands; **Co-Author:**Reinout Wiers, University of Amsterdam, Netherlands; **Co-Author:**Elske Saleminck, University of Amsterdam, Netherlands

Math anxiety has been conceptualized as a negative emotional response evoked by (the prospect of) math-related situations that disrupts performance. Mathematics anxiety peaks in adolescence, a critical period in which it might

negatively influence career choices. Math anxiety is often assessed using explicit measures. Possibly, also implicit processes play a role and learn us more about the mechanism underlying the relationship between math anxiety and math performance. The first research question is whether an implicit association between math and anxiety exists and whether assessing this adds to predicting math performance. The second research question concerns the specificity of the association between anxiety and math in comparison to English and on a more global level to the self. In this study a sample of 189 secondary school students completed explicit (questionnaires) and implicit (Single-Category Implicit Association Task) measures on anxiety in three contents, that is math anxiety, English anxiety and trait anxiety. This multitrait-multimethod approach is used to investigate the relation between implicit association between math and anxiety in relation to explicit math anxiety and to investigate the specificity of implicit and explicit math anxiety in contrast to implicit and explicit English and trait anxiety.

Maths anxiety and other anxiety forms in secondary school performance

Presenting Author: Emma Carey, University of Cambridge, United Kingdom; **Co-Author:** Denes Szucs, University of Cambridge, United Kingdom

Individuals with high levels of mathematics anxiety are more likely to have other forms of anxiety, such as general anxiety and test anxiety, and tend to have some math performance decrement compared to those with low math anxiety. However, it is unclear how the anxiety forms cluster in individuals, or how the presence of other anxiety forms influences the relationship between math anxiety and math performance. We measured math anxiety, test anxiety, general anxiety and mathematics and reading performance in 913 secondary school students in the UK. We conducted latent profile analysis of students' anxiety scores in order to examine the developmental change in anxiety profiles, the demographics of each anxiety profile and the relationship between profiles and academic performance. We found that whilst girls exhibited higher scores on all forms of anxiety, boys were more likely to fall into a group whose academic anxieties were raised relative to their general anxiety levels. This suggests that whilst girls have higher absolute levels of maths anxiety, boys are vulnerable to anxiety specifically in the academic domain rather than more generally. Furthermore, we found that those whose academic anxieties were relatively high compared with their general anxiety had a more impaired academic performance than those who scored highly on all forms of anxiety, once accounting for the effects of maths anxiety. We suggest that this may be because there are different factors generating anxiety in these different groups of students.

Variability and Effects of Preservice Preschool Teachers' Math Anxiety during the Exam Period

Presenting Author: Lars Jenßen, Freie Universität Berlin, Germany; **Co-Author:** Oliver Thiel, Dronning Mauds Minne Hogskole, Norway

Studies reveal that math anxiety can be seen as a common phenomenon among preschool teachers. In the context of preschool teachers' professional competence in mathematics, especially their mathematics didactical knowledge, math anxiety is discussed as a meaningful negative aspect. Math anxiety is also theoretically assumed to consist of affective as well as cognitive components and to show occasion-specific variability when the occasion is systematically manipulated. Nevertheless, only few studies consider these characteristics of math anxiety, especially in relation to achievement in mathematics (didactics). The present study investigated these theoretically assumed effects by applying models in terms of Latent State-Trait Theory (LST). N=225 preservice preschool teachers from Norway were asked for their math anxiety with the Mathematics Anxiety Scale-Revised in a longitudinal design during their exam period. Based on LST, trait factors as well as occasion-specific factors for each component were modelled. Results indicate that no occasion-specific variability can be found and that only the cognitive component (trait factor) shows effects on the exam grade in mathematics didactics. The size of the examined regressive relation is in line with findings from other studies. Findings are discussed concerning the utility of LST, theoretical assumptions about math anxiety and their practical implications for possible interventions in the educational context.

The impact of playing a math game at home on children's math anxiety and math performance

Presenting Author: Delphine Sasanguie, KU Leuven, Belgium; **Co-Author:** Fien Depaepe, KU Leuven, Belgium

Recently it has been suggested that there might exist a bidirectional relationship between math anxiety (MA) and mathematics performance, in which MA and mathematics performance can influence one another in a vicious cycle (Carey, Hill, Devine, & Szűcs, 2016). Given this "Reciprocal Theory", we hypothesized that an intervention will evoke the largest outcomes when children train with math content while their math anxiety is reduced. In order to reduce MA, we made use of technology in the form of a math app. A pretest-posttest intervention study with an experimental and control group design was conducted to reduce children's MA and to examine whether training with this math app positively influenced their math performance. In the experimental group, children trained 4 weeks (min 15min/week) with a math app. In the control group, children trained similarly with an app, but not in the domain of mathematics, i.e. a word search app. Both groups registered how much time they played with the app. Pre- and posttest measures consisted of a MA questionnaire and a math performance test. In total, 100 (i.e. 50 per group) fifth graders (11 years) will be examined. Currently, we are halfway data collection (22 children per group) and preliminary results indicated significantly less reported MA and better math performance after the training in the experimental group whereas no significant differences were observed in the control group.

Session B 27

Closing the gaps? Differential Educational Effectiveness as a road to school improvement

Keywords: Educational attainment, Quantitative methods, School effectiveness, Teacher Effectiveness

Interest group: SIG 18 - Educational Effectiveness

Chairperson: Sigrid Blömeke, University of Oslo, Norway

Organiser: Sigrid Blömeke, University of Oslo, Norway

Discussant: Ronny Scherer, University of Oslo, Norway

Discussant: Trude Nilsen, University of Oslo, Norway

Differential effectiveness has been widely neglected in educational research for a long time but there is increasing evidence that the field is moving forward. Whereas research on school effectiveness and improvement has primarily been concerned with overall interactions between learning outcomes, institutional settings, and school environments, taking into account potential group differences can help promoting quality and equity in education. Differential effectiveness research provides thus new research perspectives. This symposium will offer a platform to learn from the international state of research. It has four main objectives: Summarizing the international evidence on differential accountability and effectiveness, creating an awareness of the methodological challenges involved, critically discussing implications of differential accountability and effectiveness as well as proposing suggestion for educational research and practices.

Differential Teacher and School Effectiveness Research: Implications for Promoting Equity

Presenting Author: Leonidas Kyriakides, University of Cyprus, Cyprus; **Co-Author:** Bert (Hubertus P M) Creemers, University of Groningen / GION, Netherlands

This paper provides a review of research investigating quality and equity in education within the field of Educational Effectiveness Research (EER). This review shows that EER gradually moved to giving more emphasis on the quality dimension with the argument that by promoting quality, equity may also be achieved. During the last decade, an emphasis to investigating differential teacher and school effectiveness was given and the extent to which this strand of research can be used to explore the relation between quality and equity is discussed. The paper presents the results of two effectiveness studies conducted to test the validity of the dynamic model of educational effectiveness. These studies were concerned with effectiveness in different phases of schooling (pre-primary and primary education) and revealed that teacher- and school- level factors of the model can explain variation in student achievement in two different subjects (Mathematics and Language). It was also found that the socioeconomic-gap in student achievement tends to be smaller in classrooms and schools which are more effective than others in promoting student learning outcomes. Such relation was not identified when searching for differential effectiveness in terms of gender and ethnicity. Implications for research on promoting quality and equity are drawn.

Evaluating teaching quality: The validity of differentiating performance using multiple measures

Presenting Author: Sandy Taut, Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Daniela Jimenez, Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Jorge Manzi, Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Diego Palacios, Pontificia Universidad Católica de Chile, Chile

Evaluating the quality of teaching has been an important focus of educational research and improvement efforts. While identifying teachers at the extreme ends of the performance distribution is possible at relatively high levels of validity and reliability, arriving at accurate distinctions between teachers in the middle of the distribution constitutes an important challenge. The present study addressed this issue in the context of the Chilean national teacher evaluation system, which has already been subject to extensive validation. A non-random sample of mathematics teachers – N=29 evaluated as “competent” and N=22 as “basic”, constituting the two adjacent middle performance evaluation categories – and their students (N=1781), were examined in the following ways: (a) teaching practices using three videotaped lessons coded with the Classroom Assessment Scoring System for Secondary School (CLASS-S), (b) student learning on standardized grade-level and specific unit tests, (c) students’ perceptions of their teachers, and (d) teachers’ self-perceived practices and self-efficacy beliefs. Although “competent” teachers outperform “basic” teachers on almost all criterion variables, the majority of these differences did not reach significance. However, we found medium effect sizes in favor of teachers evaluated as competent regarding a number of CLASS-S dimensions, student achievement on a unit-specific test, as well as for student perceptions regarding constructivist teaching practices and pedagogical support. Implications for educational research and teacher evaluation policies are discussed.

Combating Disadvantage in the Early Years: Evaluating the impact of Children’s Centres

Presenting Author: Pamela Sammons, University of Oxford, United Kingdom; **Co-Author:** James Hall, University of Oxford, United Kingdom; **Co-Author:** Rebecca Smees, University of Oxford, United Kingdom; **Co-Author:** Jenny Goff, University of Oxford, United Kingdom; **Co-Author:** Kathy Sylva, University of Oxford, United Kingdom

Children's centres are intended to support families with young children in disadvantaged communities in England. They are intended provide integrated and high quality family services and opportunities for children's play and be locally responsive to neighbourhood need. The Evaluation of Children's Centres in England (ECCE 2009-2015) provides evidence about the

delivery of services and families' use of children's centres between 2011 and 2013. The paper focuses on the Impact strand of the evaluation which investigated the effects of families engagement with Children's Centres and their services. The evaluation used a mixed methods design and the Impact strand adopted quantitative approaches (including multilevel modelling) to investigate changes in a range of child, parent and family outcomes across three time points. The study involved over 2600 families and 117 Children's centres. It addressed two overarching research questions (RQs). Does engagement with children's centres improve child, parent and family outcomes? Which aspects of children's centres promote better child, parent and family outcomes? Engagement with children's centres was linked to better outcomes especially in terms of family functioning, including improvements in the quality of the early home learning environment. Analyses by level of family disadvantage (High and Medium versus Low disadvantage groups) indicate children's centres have the potential to lessen the effects of social disadvantage and promote equity.

When does(n't) collaboration work? Evidence on school-to-school collaboration as a strategy

Presenting Author: Daniel Muijs, University of Southampton, United Kingdom

Increasingly, policymakers across the world are looking to school-to-school collaboration as a means of improving schools that is neither top-down, nor leaves school improvement at the mercy of individual schools. In a number of countries in Europe and beyond, including the UK, Belgium, the Netherlands and Spain, government initiatives have promoted the development of networks of school intended to foster collaboration. This of course does beg the question of the extent to which such approaches actually work. In this paper, we will therefore explore the impact of collaboration on school improvement, using analysis from a range of research and evaluation studies carried out in England between 2008 and 2016. These 7 studies have used quantitative and mixed methods approaches to look at the relationship between collaboration and school improvement, as well as at factors that may explain any relationship (or lack thereof). All have used propensity score matching to create a quasi-experimental design, using existing secondary data sources, in some cases combined with surveys and case studies. Findings show differential effects, in that some studies showed a positive relationship between school-to-school collaboration and pupil attainment, while others showed no relationship. The studies did, however, point to a number of factors that could explain this differential effectiveness, which are linked to theories of school improvement and school effectiveness.

Session C 1

30 August 2017 08:30 - 10:00

Main Building E - E221

Poster Presentation

Teaching and Teacher Education

PO: Teacher Professional Development

Keywords: Achievement, Attitudes and beliefs, Case studies, Cognitive development, Content analysis, Developmental processes, Knowledge creation, Learning disabilities, Qualitative methods, Quasi-experimental research, Reading comprehension, Secondary education, Teacher Effectiveness, Teacher Professional Development, Teaching / instruction

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Jelena Radisic, University of Oslo, Norway

The projection of the past in the identity formation of teachers with learning disability

Keywords: Attitudes and beliefs, Content analysis, Learning disabilities, Qualitative methods

Presenting Author: Regina Benchetrit, Ben Gurion University / Kaye Academic College of Education, Israel; **Co-**

Author: Idit Katz, Ben-Gurion University of the Negev, Israel

This study aims to understand how past experience projects in the professional identity formation of teachers diagnosed with learning disabilities. Twelve teachers diagnosed as having learning disabilities were interviewed. The data was analyzed using qualitative method within the phenomenological constructivist tradition with narrative elements. The analysis suggests that positive and negative social encounters with peers as well as meaningful meetings with teachers in the past, have shaped the memory of the teachers and have influenced their choice of teaching as a profession. Their experiences have also affected the formation of their professional identity and their approach to teaching and education, as is reflected in their practice. Their presence, as teachers in the classroom, brings the interviewees back to their personal experiences as students. By sounding their current voice as teachers, which is somewhat mixed with their childhood silenced voices, they try to create a different discourse in the teachers' room, one that leads to acceptance and inclusion of students with LD. Now, when they have the power and can influence, the teachers see themselves as agents of social change. They seek to change other teachers' view and practice concerning students with learning disabilities.

Learning to cultivate creativity: a dual perspective of student- teachers' and pupils' learning

Keywords: Achievement, Cognitive development, Qualitative methods, Teaching / instruction

Presenting Author: Paulien Meijer, Radboud University Nijmegen, Netherlands; **Co-Author:** Ida Oosterheert, Nijmegen University, Netherlands

A challenge of (Western) education is support learners to (re)discover and cultivate their creativity. As a consequence, in current teacher education student teachers and their pupils virtually learn jointly. This study combines the learning of

student teachers as teachers/learners and that of their pupils. A course based on this 'dual approach' was tried out in Dutch teacher education. After the course, student teachers demonstrate more trust in pupils' ability to learn creatively. Their awareness of learning experiences and activities related to creative functioning increased, particularly in the affective and regulative domain. Also, several learning activities associated with creative functioning have become (more) meaningful to them. This is largely confirmed by pupils' experiences.

Coherence in mathematics teacher education

Keywords: Qualitative methods, Teacher Professional Development, Teaching / instruction, Knowledge creation

Presenting Author: Andreas Ostermann, University of Education Freiburg, Germany; **Co-Author:** Timo Leuders, University of Education Freiburg, Germany; **Co-Author:** Michael Besser, Leuphana University of Lüneburg, Germany

p { margin-bottom: 0.25cm; direction: ltr; color: rgb(0, 0, 10); line-height: 120%; text-align: left; }p.western { font-size: 11pt; }p.cjk { font-size: 11pt; }A deficit of traditional teacher education, however, is the fragmentation of teachers' professional knowledge in single disciplines. While general measures from questionnaires are available, there is only little knowledge about student teachers' perception of the complex interplay of their study areas, i.e. their perception of coherence. The present interview study investigates student teachers' perception of coherence in mathematics teacher education. While recent studies report findings about coherence between theory and practice, we focus on coherence between *mathematical content knowledge* and *pedagogical content knowledge*. We firstly identify inductively fields of knowledge that student teachers consider as relevant for their future profession as mathematic teachers. By means of qualitative content analysis we confirmed this category system deductively. Secondly we investigate existing or required coherence relations of these categories in teacher education. On the basis of these studies and further theoretical knowledge known from literature, we intend to develop a quantitative instrument to survey student teachers' perception of coherence in teaching.

Effectiveness of researcher- and teacher-trained teachers in the domain of reading

Keywords: Quasi-experimental research, Reading comprehension, Secondary education, Teacher Effectiveness

Presenting Author: Jacqueline Evers-Vermeul, Utrecht University, Netherlands; **Presenting Author:** José van der Hoeven, CED Groep, Netherlands

Observational learning seems to be a successful approach for improving students' performance. For pre-university education, it resulted in positive effects on writing performance: students learn by watching and reflecting on the teacher's or a peer's task performance. This pedagogy seems promising for reading strategy education for pre-vocational students as well. In the current research a first group of pre-vocational teachers were trained by researchers in how to put observational learning into practice in the teaching of reading. These teachers in their turn each trained one or more colleagues in how to apply this approach. Using a cross-legged panel design, we studied the effects of both training conditions on teacher approach and on reading proficiency of pre-vocational students.

From Lone Wolf to Team player: Co-Constructive Cooperation between Teachers in Personalized Teaching

Keywords: Case studies, Developmental processes, Qualitative methods, Teacher Professional Development

Presenting Author: Marco Galle, University of Zurich, Switzerland; **Co-Author:** Rita Stebler, University of Zurich, Switzerland

This study, which is a part of the longitudinal research project on schools with personalized learning concepts in Switzerland, investigates the cooperation between teachers in 10 schools. As a result of various social changes (e.g. heterogeneous pupils), the schools modify their 'grammar of schooling' (Tyack & Tobin, 1994) to implement personalized learning (Prain et al., 2015). Teachers are changing from 'lone wolf' to 'team player' in the course of these developments. The nature of cooperation of teachers may vary. Gräsel, Pröbstel, Freienberg and Parchmann (2006) are three distinguished types of cooperation: first, the *exchange* of professional materials and ideas without a common goal and resource enhancement; second, *work sharing cooperation*, in which tasks are shared under a common objective to make work processes more efficient and third, *co-construction* as an intensive exchange aimed at a common goal to relate knowledge to a common problem solution. The transcribed and semi-structured guidance interviews are analysed with a structured content analysis (Kuckartz, 2016). The survey shows that teachers often report about co-constructive cooperation. Teachers agree that co-construction is a significant factor for personalized teaching. In addition, the co-constructive cooperation objectives show diversity and involve not only developmental tasks but also the day-to-day work of teachers, such as teaching preparation, teaching, and evaluation of teaching.

Towards Personalized Learning – School and Teaching Development in one State School

Keywords: Case studies, Developmental processes, Qualitative methods, Teacher Professional Development

Presenting Author: Marco Galle, University of Zurich, Switzerland; **Co-Author:** Kurt Reusser, University of Zurich,

Switzerland

In the German-speaking region, school development is often initiated at the macro level of the school system. Developments from the micro level, that is, from teachers and school leaders, is rare. Even rarer in state schools are resource-intensive school developments targeted directly at teaching. This contribution presents results part of the longitudinal research project on schools with personalized learning concepts in Switzerland. The development processes in eleven schools are reconstructed and the case of one school is presented on the poster. The results of the qualitative data analysis show that all the schools in the study pursue resource-intensive school and teaching development to evolve school-specific, shared variants of personalized learning concepts and to integrate these into the school and teaching structures. What is required is not only an altered 'grammar of schooling' (Tyack & Tobin, 1994), but also an expanded understanding of teaching and learning as well as new forms and contents of cooperation between teachers. The teachers at the state school have not yet established a significant increase in student performance as a result of the personalized learning concepts, but do report that the students have comparatively high learning motivation, especially in the last school year, to an extent that the teachers had not previously experienced. Likewise, the teachers were able to observe increased autonomy in the students' learning.

Perception of the Contribution of the Mindfulness Program to Class Climate in Elementary School

Keywords: Developmental processes, Educational attainment, Self-regulation, Motivation and emotion

Presenting Author: Esther Grobgeld, Achva Academic College, Israel; **Co-Author:** Shirley Gelman, Achva Academic College, Israel; **Co-Author:** Ariela Teichman-Weinberg, Achva Academic College, Israel

Mindfulness is the awareness that arises out of paying willful attention, at the present moment, and in a non-judgmental manner. The present study examined the perception of the contribution of the Mindfulness Program to class climate in elementary school. Semi-structured interviews were held with fifth and sixth graders who have been practicing mindfulness for the past two years. The students perceive the mindfulness language as a tool that enables them to delay their reaction, cope with conflicts in a non-violent manner, cooperate and feel efficacious and safe. These skills contribute to the creation of a pleasant and safe climate for the students in the class.

Mediating Role of Need Satisfaction between Classroom Goal Structures and Educational Functioning.

Keywords: Educational Psychology, Higher education, Motivation, Motivation and emotion

Presenting Author: Aysenur Alp, Middle East Technical University, Turkey; **Co-Author:** Aikaterini Michou, Bilkent University, Turkey

The goal-related messages in a classroom are associated with students' experiences and functioning in learning. In the present study, we investigated in a sample of 171 Turkish university students (60% females; $M_{age} = 19.79$, $SD = 1.68$), the relation of classroom goal structures to students' educational satisfaction and state flow through their experience of need satisfaction. Hierarchical regression analysis showed that mastery-approach (MAp) goal structures (i.e., classroom environment focuses on learning and self-improvement) and performance-approach (PAp) goal structures (i.e., classroom environment focuses on normative success) were positively and negatively related to need satisfaction respectively. Hierarchical regression analyses also showed that need satisfaction was related to educational satisfaction and flow in class-related tasks. Bootstrap analyses, finally, indicated the mediation of need satisfaction in the relation of MAp and PAp goal structures to educational satisfaction and state flow. Understanding need satisfaction as a mediator of classroom goal structures and educational outcomes help teachers to reconsider their goal-related messages in the classroom.

Quality of motivation in Japanese secondary school: The first in a three-year cohort study

Keywords: Achievement, Developmental processes, Motivation, Secondary education

Presenting Author: Quint Oga-Baldwin, Waseda University, Japan; **Co-Author:** Luke Fryer, University of Hong Kong, Hong Kong

Background While the literature internationally and in Japan suggest negative or flat trajectories across the rest of compulsory education, recent studies in Japan have shown positive trends in quality of motivation to learn foreign

languages in upper elementary school. However, the question remains whether this trend continues across the transition into secondary school. **Aims** In this longitudinal cohort study, we investigate the antecedents and relationships between three different school subjects (Math, Japanese, and English) as well as students' perceptions of their classroom climate in order to create a model of school motivation in Japan. **Methods** Students' quality of motivation and perceptions of the classroom climate for Japanese, Math, and English were measured at two time points during the 2016 school year. Longitudinal structural equation modeling and person-centered profile analyses will be used to analyze changes over time. **Results** Preliminary results show acceptable internal validity and reliability for the scales. Final results will be presented in light of achievement results at the end of the school year.

Studying the Role Depictions of Academic Information Play in At-Risk Students' Motivation to Succeed

Keywords: At-risk students, Educational Psychology, Educational Technology, Motivation

Presenting Author: Stephen Aguilar, University of Southern California, United States; **Co-Author:** Neil Jacobson, University of Southern California, United States

Spurred on by the growth of data analytics technologies designed to detect, predict, and/or intervene on student learning (i.e., learning analytics), students are increasingly being presented with performance-related information in graphic form. In contrast to traditional modes of academic feedback (e.g., grades), such information is designed to be both personal and information rich. Yet, is more information always better, or can it pull students toward understanding their progress in ways that are motivationally counterproductive? The research on student motivation largely emphasizes detecting the relationships between students' motivational beliefs and their academic outcomes, and suggests that beliefs centered around mastering tasks are more beneficial to learning when compared to those which emphasize peer comparisons. Yet, few studies have examined the role depictions of academic information play in shaping motivational beliefs—especially for students who are academically at-risk. This paper addresses the gap in the literature by examining the various sense-making practices utilized by at-risk students when presented with depictions of academic information. Results of our mixed-methods study found, indeed, that students with higher achievement goal orientation predicted they would perform at lower levels when presented with visually presented information that compared their performance to class averages. No relationship was found between achievement goals and graphs depicting only individual performance. Thus more information is not necessarily better, which has implications for how achievement-related graphic information should, or certainly for some individuals, should not be provided.

Academic stressors and ways of coping: a qualitative approach

Keywords: Assessment methods and tools, Content analysis, Qualitative methods, Motivation and emotion

Presenting Author: Maria Teresa Goncalves, Polytechnic Institute of Viana do Castelo, Portugal; **Co-Author:** Fritz Mende, University of Porto, Portugal; **Co-Author:** João Leite, University of Porto, Portugal; **Co-Author:** Márcia Carvalho, University of Porto, Portugal; **Co-Author:** Marina Lemos, University of Porto, Portugal

Besides negative major life events people have to cope regularly with critical normative developmental stressful events within the various life domains. Within a research project on academic motivational resilience the present study used a qualitative approach to identify, within a specific cultural context: i) the main stressors that children and adolescents face in everyday life and more specifically to obtain their descriptions of stressors in the academic context; and ii) the most typical ways of academic coping. Participants were 30 Portuguese students from 4th, 6th and 8th grades. A semi-structured interview was used to gather descriptions and meanings of children experiences of everyday stressors and more specifically of academic stressors. The interview was based on the principles of the cognitive interviewing using verbal probing techniques and consisted of a set of open-ended questions and a concurrent verbal interviewing while students answered the Multidimensional Measure of Coping (Skinner, Pitzer, and Steele, 2013). Findings confirm the centrality that children attribute to stressors in the academic domain, and contribute to the categorization of types of stressful events in the academic domain, their differential frequency, and the emotional reactivity and perceived controllability associated to the various stressors. The study also contributes to a conceptual analysis of stress and coping in a specific cultural context based on the cognitive interviewing.

Starting a PhD: significant events and the role of the associated emotions along PhD trajectories

Keywords: Doctoral education, Educational Psychology, Emotion and affect, Higher education

Presenting Author: Crista Weise, Autonomous University of Barcelona, Spain; **Co-Author:** Mariela Aguayo, Universitat Ramon Llull, Spain

This research contributed to the understanding of the role of the emotions in the process of becoming a PhD, suggesting that focusing on both in negative and positive emotions in the context of the PhD trajectory is possible to understand better the engagement and involvement of the students. In the sample, the emotions are quite variable, they change along the trajectory, even though some of them remains and appears repeatedly in different SE. The most important are related to specific research factors. The findings showed that students have a positive experience when doing their PhD courses. Most of them associate their experiences with positive emotions rather than negative ones, although they faced challenges with high levels of emotional intensity. It was used a qualitative approach, based on the analysis of 10 semi-structured interviews applied to PhD students from Catalan Universities. Also were used an episodic interview and a journey plot identifying the main significative events they went through during their PhD. Becoming a researcher is an enormous challenge that requires accumulation of experience, specific skills, and formation. People who decide to follow an academic

career should consider that higher cognitive, emotional, personal competencies are needed to deal with a Ph.D. career. The objectives of the study are to identify the emotions that SE embraces, along with Ph.D. trajectories, highlighting the aspects they relate to analyze the dynamics of the PhDs' students emotions along with their trajectory and the role they play when facing the required tasks.

Teachers' growth or fixed mindsets and the appraisal of achievement in the context of feedback

Keywords: Attitudes and beliefs, Qualitative methods, Secondary education, Video analysis

Presenting Author: Emmy de Kraker-Pauw, VU University Amsterdam, Netherlands; **Co-Author:** Lydia Krabbendam, Vrije Universiteit Amsterdam, Netherlands; **Co-Author:** Nienke van Atteveldt, VU University Amsterdam, Netherlands; **Co-Author:** Floryt Van Wesel, Utrecht University, Netherlands

Abstract

The pedagogical beliefs (e.g., beliefs or 'mindsets' concerning the malleability of intelligence) that teachers hold may have a far-reaching impact on their teaching behaviour. In general, two basic mindsets can be distinguished with regard to the malleability of intelligence: fixed (entity) and growth (incremental). In this proposal we present two studies investigating the associations between teachers' mindset and 1) their appraisal of students' achievements and 2) the feedback they provide. Study 1 focuses on the associations between mindset and appraisal. The findings reveal an association between growth mindset and the appraisal of increasing student achievements. Study 2 investigates the impact of teachers' mindset on the amount and type of oral feedback they provide to their students. Contrarily to expectations, the findings reveal a significant negative correlation between mindset and the amount of growth-oriented feedback. Additionally, the findings reveal that gender affects both mindset and appraisal.

Using self-evaluation in post-observation conferences between museum educators and museum docents

Keywords: Assessment methods and tools, Reflection, Teacher Professional Development, Lifelong learning

Presenting Author: Mark Schep, University of Amsterdam, Netherlands; **Co-Author:** Carla Van Boxtel, University of Amsterdam, Netherlands; **Co-Author:** Julia Noordegraaf, University of Amsterdam, Netherlands

In this study we investigated how a self-evaluation instrument contributed to a post-observation conference of museum docents (tour guides) and museum educators. First, out of a list of 45 competencies (organized in four categories), defined in a previous study, a self-evaluation instrument and an observation instrument were constructed. Fifteen museum docents, working in an art museum or a history museum, filled in the self-evaluation questionnaire in which they had to rate themselves on all competencies. The docents could use these scores to answer subsequent questions about their strengths and points for improvement, for all four main categories of competence. In the same period an educator observed two tours of the docent, using an observation instrument that focused on the same competencies. Next, the educator and the docent engaged in a (video-recorded) post-observation conference. During the conference the docent was asked to put forward his/her strengths and points for improvement, which deviates from the educator (observation) directed conferences that are prevailing in the participating museums. Afterwards, all participants were interviewed about their experiences with the instruments and the post-observation conference(s). Analysis of the interviews and preliminary analysis of the video-recordings show a perceived agency by the docents, the perceived equality between the participants of the conference, and the reported sense of 'objectivity' as a result of the list of competencies that was used. The instruments can help docents to further professionalize their practice, and help educators to structure post-observation conferences.

Teacher-student relationships: comparing Dutch academic and nonacademic primary school teachers

Keywords: Pre-service teacher education, Primary education, Social interaction, Teacher Professional Development

Presenting Author: Sanne Dijkema, University of Groningen, Netherlands; **Co-Author:** Simone Doolaard, University of Groningen, Netherlands; **Co-Author:** Roel J. Bosker, Rijksuniversiteit Groningen, Dept of Education and GION, Netherlands

In the Netherlands an academic Bachelor's degree program was developed, in 2008, preparing for the profession of primary school teacher. This Bachelor's degree program integrates the traditional higher vocational education program and the academic program of educational sciences and pedagogy. Teachers graduating from this academic trajectory hold a double Bachelor's degree in both higher vocational education and university. Establishing this new degree resulted in

primary school teachers with different educational backgrounds working in the field. This study compared teacher interpersonal behavior, in terms of agency and communion, of beginning academic and nonacademic Dutch primary school teachers. Teacher interpersonal behavior was measured using the Questionnaire on Teacher Interaction for Primary Education (QTI-PE). Both student (N= 1162) and teacher perceptions (N=74) were collected. Since data-collection is ongoing (to be finalized in May 2017), preliminary results provide a first exploration of the development of teacher interpersonal behavior in primary education for teachers with different educational backgrounds.

Profiles of Teachers' Conceptions of the Purposes of Assessment

Keywords: Assessment methods and tools, Attitudes and beliefs, In-service teacher education, Teacher Professional Development

Presenting Author:Helenrose Fives, Montclair State University, United States; **Co-Author:**Nicole Barnes, Montclair State University, United States

AbstractTeachers' conceptions about assessment influence their classroom assessment practices. In this investigation, we examined 179 K-12 teachers' conceptions of the purposes of assessment from a person-centered perspective. An exploratory factor analysis of teachers' responses to the Conceptions of Assessment Instrument yielded a three-factor model: assessment as valid for accountability, assessment as irrelevant, and assessment improves teaching and learning. Next, we used cluster analysis to identify belief profiles of teacher groups: Cluster-1: Moderate, Cluster-2: Irrelevant, Cluster-3: Teaching and Learning. Within and across cluster comparisons revealed significant differences indicating that these are distinct belief profiles thereby suggesting that teachers can, and do, hold multiple beliefs about assessment simultaneously.

Exploring reflective practice in mentor teacher and teacher trainee relationship

Keywords: Higher education, Pre-service teacher education, Reflection, Teacher Professional Development

Presenting Author:Kinga Kaplar-Kodacsy, Eötvös Loránd University, Hungary; **Co-Author:**Helga Dörner, Central European University, Hungary

This paper outlines findings from a research project on mentor teachers' conceptualizations and strategies of mentoring pre-service teachers for reflective practice. The study was conducted with the aim to explore the qualitatively different ways in which mentor teachers conceive of mentoring for reflective practice and also how they translate this into actual mentoring strategies. We interviewed 6 senior mentor teachers who are certified mentors at Hungarian primary and secondary schools. The transcripts were analysed using a phenomenographic approach. Mentor teachers were found to oscillate between fragmented and cohesive conceptions of 'mentoring for teaching' with varying levels of integrating the notion of reflective practice. Based on the results a system of conceptualisations and strategies was created. These findings provide directions for designing a survey tool that will be used in a large-scale research study scheduled for 2017-18.

Evaluating Professional Competencies of Science Teachers Pertinent to Elementary Particle Physics

Keywords: Competencies, Pre-service teacher education, Science education, Teacher Professional Development

Presenting Author:Michaela Oettle, University of Education, Freiburg, Germany

The project aims at designing an instrument suitable for assessing professional competences of science teachers pertinent to elementary particle physics. Motivated by the huge discrepancy between the planned incorporation of particle physics in scholar curricula and the previously lacking effort in exploring the corresponding domain-specific professional competences required by science teachers, the study seeks to give deeper insight into possible issues arising when the topic becomes firmly established in school classes. By portraying the level and nature of those competences, the project targets to establish the status quo as well as an in-depth look into the preconceptions teachers might have themselves. In order to conceptualize the relevant categories subject matter knowledge and pedagogical content knowledge, two different strategies were pursued: The subject matter was modeled by an acquisition of expert knowledge through an online survey and follow-up interviews. The results were analyzed in terms of qualitative explorative and quantitative aspects and provide the basis for the construction of performance test items. The pedagogical content knowledge was conceptualized pursuing a theory-based strategy relying on well-established models in science educational research. The combined results provide the basis for a testing instrument for teachers who have addressed particle physics within their school classes. The research focusses initially on the German-Speaking world. The study design and results on the modelling of the competence fields are being presented and discussed. We expect to define well distinguished categories in the subject matter and pedagogical content knowledge field as well as design testing items accordingly.

Metacognitive control in a memory task in elementary school children

Keywords: Cognitive development, Cognitive skills, Metacognition, Primary education

Presenting Author: Claudia Roebers, University of Bern, Switzerland; **Co-Author:** Natalie Guggisberg, University of Bern, Switzerland; **Co-Author:** Martina Steiner, University of Bern, Switzerland; **Co-Author:** Mariette van Loon, University of Bern, Switzerland

In elementary school children are more and more required to self-regulate their learning, and in order to do so effectively, they have to be able to recognize their errors and correct these to ensure effective learning and good performance. This research examined metacognitive control in elementary school children, and addressed whether children are able to recognize their errors, and control learning by withdrawing incorrect responses and maintaining correct responses. Three age groups were tested, 2nd, 4th and 5th graders learned the meaning of Japanese characters (Kanji), and afterwards they took a recognition test. At the end the children had the possibility to control their own learning. On the basis of traffic lights, they could press the green traffic light to maintain their answer or the red traffic light to withdraw their answer. Findings show a positive relation between response accuracy and control (maintenance or withdrawal) in all three age groups, such that the children accurately adapted their control behavior to their test responses. There were no age-related differences in the metacognitive control, suggesting that 2nd grade children are already capable to accurate control their learning when given the chance to withdraw incorrect answers.

Investigating implicit theories of ability and its relationship to students self-regulated learning

Keywords: Attitudes and beliefs, Goal orientation, Self-regulation, Writing / Literacy

Presenting Author: Yves Karlen, University of Zurich, Switzerland; **Co-Author:** Carmen Hirt, University of Zurich, Switzerland; **Co-Author:** Katharina Maag Merki, University of Zurich, Switzerland; **Co-Author:** Francesca Suter, University of Zurich, Switzerland

Implicit theories of ability highly impact our actions, emotion, motivation, and how we perceive knowledge and ourselves in everyday situations. Research showed that implicit theories about the stability (entity theory) and the malleability of abilities (incremental theory) are of particular relevance (Dweck & Master, 2008). In school and academic contexts, they are especially important in situations where students have to self-regulate their learning (SRL). This study explores the role of implicit theories of writing ability in cognitive, metacognitive, and motivational SRL processes of students who write their first academic paper. N ≈ 1200 students from the upper secondary education level completed an online self-report survey that included measures on implicit theories of their ability in academic writing, achievement goal inventory, and strategy use. Results indicated that the students' individual implicit theory of their writing ability is an important predictor for strategy use. The effects held stable after including achievement goals as moderators. The implications of these findings for research and instruction are discussed.

Outcome Feedback and Reflection to Improve Calibration of High School Students: A Longitudinal Study

Keywords: Instructional design, Metacognition, Reflection, Self-regulation

Presenting Author: Marloes Nederhand, Erasmus University Rotterdam, Netherlands; **Co-Author:** Huib Tabbers, Erasmus University Rotterdam, Netherlands; **Co-Author:** Remigius (Remy) Rikers, UCR / Utrecht University, Netherlands

In this longitudinal study we investigated whether calibration accuracy of high school students could be improved by providing them with outcome feedback and encouraging them to reflect on the (mis)match between their estimated performance and actual outcome. Students of four experimental groups were compared. First a group of students who only had to estimate their performance on each exam (Practice group). Second, a group of students who needed to estimate their performance on each exam just as the Practice group. However, after receiving outcome feedback (how well they performed on the exam) students also had to write down the difference between their estimation and actual exam score (Bias group). The third group of students followed the same procedure as the Bias group, but besides only writing down the difference between their estimation and actual performance, these students also reflected on causes for their mismatches (Reflection group). These three groups were compared to a control group with students who only estimated their performance on the first and the final exam during the experiment. Data are being gathered at the moment and results will be discussed during the symposium.

The effectiveness of journals in educational settings. A review study

Keywords: Metacognition, Quasi-experimental research, Self-regulation, Student learning

Presenting Author: Sabine Fabriz, Goethe-Universität Frankfurt, Germany; **Co-Author:** Charlotte Dignath, Goethe-University Frankfurt, Germany; **Co-Author:** Franziska Perels, Saarland University, Germany

In a literature review of 52 studies, the effectiveness of learning journals as tools to foster self-monitoring in learning is explored. The literature search included records from 2000 to 2016 from several databases (e.g. PsycARTICLES; PsycINFO) and with different denotations (e.g. learning diaries, learning journals). After screening the records and

assessing for eligibility criteria (including pre-post design, control group and a minimum group size of 10), 52 studies remained. We developed a coding scheme to assess the study characteristics and allow for the identification of possible predictors for the effectiveness of the Intervention. The poster will present the developed coding scheme used for the review and a meta analysis to follow as well as the results of the review and their implications.

Development of tools for identifying teacher metacognition

Keywords: Mathematics, Metacognition, Teacher Effectiveness, Teaching / instruction

Presenting Author:Emine Erkin, Bogazici University, Turkey; **Co-Author:**Gursu Asik, Bahcesehir University, Turkey

Teachers' metacognition is principal for both developing students' metacognitive knowledge and skills, and to apply metacognition to their own instruction. In order to develop metacognitive skills and use these skills effectively in educational settings, teacher training needs to focus on three aspects of teachers' professional description: the use of metacognitive skills in teachers' professional development, in teachers' teaching processes, and in how metacognitive processes can be taught to students to improve their learning. This study is an attempt on the development of assessment tools to examine teacher metacognition underlying the instructional practice in mathematics. To this end we have planned to develop three instruments each corresponding to a different aspect of teacher metacognition. 1) For teachers' general metacognitive habits a self-report questionnaire is developed. 2) An observational tool that allows for a systematic examination of teacher's instruction in the classroom is designed. The observation tool is in a checklist format, which allows researchers to assess both the frequency of metacognitive acts and the quality of metacognitive actions during the instructional process. 3) An observation tool for examining the students' metacognition will be the final step. The methodology of the study is based on a design-based research and development of the observation checklist is considered as to be a starting point for the improvement of teachers' metacognition. The data will be collected through observing instructions of middle school math teachers and their students.

Socially Shared Regulated Learning with MetaTutor

Keywords: Computer-assisted learning, Computer-supported collaborative learning, Peer interaction, Self-regulation

Presenting Author:Jolique Kielstra, Radboud University Nijmegen, Netherlands; **Co-Author:**Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:**Michelle Taub, North Carolina State University, United States; **Co-Author:**Roger Azevedo, North Carolina State University, United States

This poster describes a new study to be executed this winter into how pedagogical agents in MetaTutor can support socially shared regulated learning through reciprocal peer tutoring. In this 2-day study students will be working together in dyads on a shared assignment in a computer based learning environment. The first day students will be trained and informed about the assignment they will be working on in MetaTutor the second day. During the second day the dyads will each execute the role of tutor and tutee while working together on the assignment. Data will be collected through multiple datachannels, such as pre- and posttest measurements, logfiles, eyetracking, video- and audio recordings. This data will provide more understanding on the influence of socially shared regulated learning within a computer based learning environment with and without pedagogical agents. Based on current literature expectations are that reciprocal dialogs between tutor and tutee on the shared assignment will stimulate metacognitive processes. The influence of pedagogical agents within computer based environments on reciprocal dialogs is missing and data from this study will provide more insight on these interactions within such a computer based learning environment.

Instructional preferences and learning (transfer) in further education - a longitudinal study

Keywords: Quantitative methods, Vocational education, Workplace learning, Lifelong learning

Presenting Author:Michael Goller, University of Paderborn, Germany; **Co-Author:**Christoph Fischer, University of Paderborn, Germany; **Co-Author:**Christian Harteis, University of Paderborn, Germany

This contribution analyses determinants that predict learning in formal training courses as well as the potential transfer of the learned knowledge and skills into the workplace. A main focus lies on the effects of a fit between individuals' instructional preferences and the instructional methods that are actually applied in the training courses. A good fit between both is assumed to predict high learning outcomes by being positively related to an increased subjective enjoyment of the

training course as well as a higher perceived usefulness of the training as such (matching hypothesis). An increased knowledge gain is then assumed to predict learning transfer at work as long as the individual is sufficiently supported by both colleagues and supervisors. These theoretically and empirically grounded hypotheses were translated into a mediated and moderated path model. To test this model a two-wave longitudinal study was conducted. Over a time frame of one year each employee of a German university that participated in an in-house training course filled in two separate questionnaires (one directly after the course and one four month after the first one). This contribution presents and discusses the core findings of this study. Practical implications for the implementation of training courses will be given.

Innovative mathematics curriculum and its influences on teachers' knowledge and beliefs

Keywords: Attitudes and beliefs, Mathematics, Primary education, Teacher Professional Development

Presenting Author:Laurinda Lomas, Australian Catholic University, Australia; **Co-Author:**Doug Clarke, Australian Catholic University, Australia

Research focused on the classroom application of a teacher's mathematical knowledge and beliefs and the effect of this on student understanding has highlighted the need for further investigation into professional development strategies which promote deep and flexible teacher understanding of curricular content. As teaching is a cultural activity embedded in a unique context, such opportunities for teachers may be best placed amid the relevance of everyday classroom practice, and supported by curriculum which promotes such change. This paper reports on data collected as part of a doctoral study aimed at observing the changes in mathematical knowledge and beliefs of three Grade 5/6 teachers as they implemented a four-week, innovative curriculum unit based on the tenets of Realistic Mathematics Education (RME). Case study methodology within a constructivist epistemology and an interpretivist theoretical perspective promoted deep understanding of complex classroom interactions. The Interconnected Model of Teacher Professional Growth (Clarke & Hollingsworth, 2002) supported interpretation of growth and change mechanisms. Analysis of the teachers' implementation of this Fractions unit revealed the pivotal influence of teacher's stated and inferred beliefs about mathematics and mathematics teaching on classroom practice. The foregrounded content and pedagogical content knowledge evident in the teachers' pre and post-intervention lessons, their reflections on practice, and the vagaries of didactic contracts in a change environment have the potential to contribute to current research on professional learning in mathematics. Emergent themes about curriculum fidelity, authority and task implementation promote further consideration of the support needed to sustain teacher learning.

Knowledge restructuring through case-processing; a review of studies in three professional domains

Keywords: Cognitive development, Meta-analysis, Professions and applied sciences, Reasoning

Presenting Author:Els Boshuizen, Open University of the Netherlands, Netherlands; **Co-Author:**Hans Gruber, University of Regensburg, Germany; **Co-Author:**Josef Strasser, University of Augsburg, Germany

With increasing levels of expertise development work and learning become more and more intertwined. Processing of cases is the core of much expert work; it heavily depends on activating and applying relevant prior knowledge, and seeking new knowledge when prior knowledge is not sufficient. It was conjectured that this case processing plays a crucial role in connecting working processes and learning. The concepts of knowledge encapsulation and (illness) script development, brought together in a theory of Knowledge Restructuring through Case Processing, emphasize the importance of these processes that would result in a knowledge base that is better tuned to case processing and allows better and faster reasoning/ problem solving. This theory was developed for the medical domain, but researchers in other fields also apply the concepts in their work. We did a review study in which we investigated whether similar effects of case processing can be found in other fields that are also characterized by working with cases, i.e., counselling, business and law. We found 30 studies in counselling, 8 in business and 12 in law. Many studies concerned the quality of the diagnosis or decision, its relation with experience, associated difficulties with information processing and/or knowledge application. In all domains indications for script development and knowledge restructuring were found. Deliberation, reflection and not seeing work as routine had positive effects on present and future decision quality.

Entrepreneurial failure: Is it possible to prevent it?

Keywords: Cognitive skills, Competencies, Vocational education, Workplace learning

Presenting Author:Fritz Oser, University of Fribourg, Switzerland; **Co-Author:**Susan Müller, University of St. Gallen, Switzerland; **Co-Author:**Lara Forsblom, University of Fribourg, Switzerland

Based on the fact that the number of start ups in European countries is quite substantial (especially in Switzerland with more than 40'000 a year) we were looking on failure rates of companies, the psychological meaning of failure and the possible/not possible rescue from failure. Our research project aims to make a contribution to overcome the danger of failure, or to initiate a recovery. In a fine-tuned intervention study we work with a randomized field-design, treating four groups of secondary-II-students, namely a) one with entrepreneurial techniques and failure cases, b) one with entrepreneurial techniques and success cases, c) one with entrepreneurial techniques and no cases, and d) a control group without any pedagogical influence. Since the intervention study lasts until August 2017, we would like to present here the measurement instruments with the respective validation results and their hidden treatment relationships.

Alumni Perspectives on Entrepreneurial Success in Vocational HE

Keywords: Cognitive skills, Competencies, Higher education, Workplace learning

Presenting Author:Timo Nevalainen, Tampere University of Applied Sciences, Finland; **Co-Author:**Pia Hautamaki,

Tampere University of Applied Sciences, Finland; **Co-Author:**Petri Nokelainen, Tampere University of Technology, Finland

In our paper, we present the preliminary analyses and findings from a qualitative study based on narrative interviews conducted with alumni members (n = 15) of a degree programme in entrepreneurship, Proakatemia. Proakatemia is an entrepreneurship education unit and a learning community in Tampere University of Applied Sciences (TAMK) in Tampere, Finland. The study focuses on the experiences of Proakatemia alumni members before, during and after their studies. We were particularly interested in those experiences that the alumni members saw as meaningful in connection with their later success as entrepreneurs. Collected data was analysed collaboratively by using the methods of narrative analysis (Andrews et al., 2013) and descriptive phenomenological analysis developed by the psychologist Amedeo Giorgi (2009). Narrative analysis was done to study events that were experienced as moments of significant learning by the participants and descriptive phenomenological analysis was used to inquire into the structure of those experiences. We also contrasted the findings with the 3-P model of workplace learning (Tynjälä, 2012).

Feedback of pupils as a starting point for teacher reflection – First results of an empirical study

Keywords: Higher education, Pre-service teacher education, Reflection, Teacher Professional Development

Presenting Author:Corinne Wyss, Zurich University of Teacher Education, Switzerland; **Co-Author:**Simone Biaggi, Zurich University of Teacher Education, Switzerland

Feedback from students is an essential, yet rarely used method for teaching development (Kämpfe, 2009). However, the ratings of students are significant since they represent an internal view of the teaching and can thus be very valuable for the reflection of teaching, the teaching quality and the professional competence of the teacher (Hattie, 2009). The intervention project “Student feedback to support teachers’ reflection” at Zurich University of Teacher Education investigates the effectiveness of student feedback for promoting pre-service and in-service teachers’ quality of and attitude about reflection of their lessons. During two terms 200 – 240 students aspiring to become teachers for the first level of secondary education (grades 7 to 9) are advised to get student feedback during their practical training and to work with it in three different ways: The first intervention group a) uses the student feedback to reflect about its own teaching together with a peer, the second group b) uses it to reflect together with an experienced teacher while a third group c) uses the student feedback to reflect by writing a reflective journal. The oral and written reflections are analysed with respect to the three different settings of reflection. In addition, the changes of motivation and volition to work with student feedback were measured pre-post using a written test. The findings of the study can give valuable inputs for teacher education and teacher professional learning concerning the use of student feedback and teacher reflection.

Mathematics in Latin American Primary Education: diverse contexts, different results

Keywords: Educational policy, Learning and developmental difficulties, Mathematics, Numeracy

Presenting Author:Beatriz Vargas Dorneles, Federal University of Rio Grande do Sul - UFRGS, Brazil; **Co-Author:**Luciana Corso, Federal University of Rio Grande do Sul -UFRGS, Brazil

The primary aim of this paper is to analyze the mathematical performance of students from some Latin American countries and, secondly, identify policies designed to attend the needs of low achievers in mathematics. As Latin America comprises twenty one very different countries, excluding Caribbean countries, with diverse languages, cultural traditions, educational systems and policies, we summarize the situation in the eight Latin American countries (Argentina, Brazil, Chile, Colombia, Costa Rica, Mexico, Peru, and Uruguay) that participated in PISA, in 2012, the latest assessment available at the time of writing. We describe part of the results available in OECD documents, discuss some of the policies in the region, and conclude that the situation varies across the Latin American countries, for example, in Chile approximately 50% of students are very low-achievers in mathematics, while in Peru the figure is 75%, and highlight the Brazilian results in mathematics, which significantly improved from 2000 to 2012. The change resulted from a broad range of policies including investments in improving both teacher quality and resources. Throughout Latin America there are no national documented policies to specifically attend low achievers in mathematics. We conclude that most Latin American students are incapable of using basic mathematical concepts, procedures or rules to solve simple basic number problems, despite the improved results

obtained in mathematics education in recent years.

Exploring informal learning and integration of foreign nurses in Finnish workplaces

Keywords: Communities of practice, Content analysis, Informal learning, Workplace learning

Presenting Author:Pauliina Alenius, University of Tampere, Finland; **Co-Author:**Päivi Vartiainen, University of Tampere, School of Education, Finland; **Co-Author:**Marja Koskela, University of Tampere, School of Education, Finland

The aim of the study was to examine the informal learning experiences and integration of foreign nurses into Finnish social and health care work communities. In recent years nurses have increasingly been recruited to Finland, particularly from the Philippines and Spain. Yet there are only a few studies examining the learning experiences and integration of foreign nurses at Finnish workplaces. International recruitment of foreign health care personnel is increasing also in other European countries. The study applies theoretical concepts and perspectives from the situated learning theory, for example, concerning learning trajectories (Wenger 1998). The data were gathered on the MULTI-TRAIN project funded by the Academy of Finland, and consists of 35 interviews with foreign employees (19 Estonian, 7 Filipino, 9 Spanish) working in five social or health care workplaces in Finland and 59 interviews with their Finnish co-workers and superiors. All interviews were analyzed using qualitative content analysis. The results showed that the foreign nurses' socio-cultural learning and integration into Finnish workplaces was challenging due to formal and informal hierarchies. The nurses' previous education or professional experiences were not fully recognised. The Estonian nurses followed mainly insider learning trajectories and those Estonian nurses working as trainees followed inbound trajectories with the prospect of becoming full participants. However, Spanish and Filipino nurses often remained in peripheral positions in their work communities, following peripheral learning trajectories.

How to arouse the interest of all students in the intercultural EFL classroom

Keywords: Cultural diversity in school, Language (Foreign and second), Teaching / instruction, Multicultural education

Presenting Author:Svenja Vieluf, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Kerstin Göbel, University of Duisburg-Essen, Germany

The present study aims at contributing to our knowledge base on intercultural teaching and learning in EFL classrooms. Taking account of the importance of motivational processes in this context, it examines which kinds of intercultural EFL lessons are evaluated by students as being interesting. Analyses are based on data from a German video-study of EFL teaching with a sample consisting of 93 EFL classrooms with 2,047 students. Videos were rated by experts with regard to three broad dimensions of teaching quality (classroom management, motivational support, and cognitive activation) including 11 sub-dimensions. Associations of these ratings with students' evaluations of the lesson were analyzed by means of two-level regression analysis, including interactions between lesson features and student competencies. Findings suggest that students judged those lessons as being more interesting in which a positive social climate was realized. The quality of classroom management did not appear to be relevant in this context. The role of the lesson's potential for cognitive activation depended on students' prior level of intercultural sensitivity: Students at higher stages of intercultural sensitivity development evaluated lessons in which a reflection of cultural differences was initiated as being more interesting than less reflective lessons, whereas no such links were observed for all other students.

Opportunities and challenges for a STEM interdisciplinary agenda

Keywords: Educational policy, Interdisciplinary, Mathematics, Science education

Presenting Author:Russell Tytler, Deakin University, Australia; **Co-Author:**Vaughan Prain, Deakin University, Australia

There is increasing global concern about the engagement of students with the STEM subjects, and the need for students to acquire the STEM skills necessary for participation in 21st century societies. Calls for new directions in STEM education amount to a re-thinking of the STEM subject disciplines. Drawing on a comparison of STEM participation across 26 countries, and analysis of the discourse around STEM advocacy, this paper investigates the nature of drivers of a strong STEM interdisciplinary agenda, and the implications for school systems and for the STEM disciplinary subjects. An analysis of integrated STEM innovations in Australian schools raises questions about the relationship between authentic interdisciplinary STEM tasks and the nature of STEM subject epistemes. It is argued that the STEM subject disciplines in schools need to remain the basis of STEM learning, but need to be significantly re-thought if they are to answer the call for critical and creative thinking that underpins STEM advocacy.

Between Two Worlds: Identity Construction Among Haredi University Students in Israel

Keywords: Case studies, Culture, Ethnography, Social interaction

Presenting Author:Naomi Perl, Mandel Leadership Institute, Israel

This study investigates the integration of a social minority group in Israel within a mainstream academic institution, exploring processes of integration and identity. It focuses on the case Jewish-Israeli Haredi (ultraorthodox) students who are attending the specialized Haredi Leadership Development Program within a multicultural, secular university and examines the effects of academic studies and culture on Haredi students' construction of complex identities.

The study applies ethnographic tools to explore student experiences of the cultural clash between their community identity and the academic institution. The research seeks to map tensions and challenges that the students face; shifts in student self-concepts over the course of their studies; and students' strategies for coping with the tensions that arise as a

result. Data were collected and triangulated by: Observing classes that were designed especially for students in the program; analyzing students' writing assignments and digital communications at crucial points in their study program; and interviews with the students. Preliminary analysis revealed four main categories of response to tensions between students' conservative religious identity and their emerging academic and civic identity: 1. Compartmentalization, 2. Conversion, 3. Cynicism, 4. Complexity. The final category – complexity – may indicate the emergence of a threshold elite group with the potential to contribute to broader streams of social and civic integration of this minority group within mainstream Israeli society.

Exploring learning of Mathematics among immigrant youths in Vestfold Norway

Keywords: Cultural diversity in school, Learning approaches, Mathematics, Motivation and emotion

Presenting Author: Sikunder Ali, University College of Southeast Norway, Norway

Main purpose of this project is to understand the complexities of youths with different cultural backgrounds and how they are engaged in the processes of forming their futures through their engagements in educational acts (in schools and outside schools) with special focus on their engagement with learning of Mathematics in Norway. In specific, through this research project I wish to : to explore socio-cultural dimensions responsible for the formations of foregrounds of youths (and their engagement with learning of Mathematics) in Norway. to find out the dominant social representations that shape the lifeworld of these immigrants and subsequently their learning of Mathematics to explore the kinds of symbolic resources that immigrant youths or their parents(families) use in order to enhance their educational and subsequently life possibilities in Norwegian society To draw implications for teacher education (especially learning and teaching of Mathematics) from working on the notion of formation of foregrounds of youths in Norwegian society.

Students' textbook strategy use: Effects of utilizing textbooks in mathematics class:

Keywords: Collaborative Learning, Educational Psychology, Mathematics, Teaching / instruction

Presenting Author: Mari Fukuda, University of Tokyo, Japan

For self-regulated learning, it is important to use textbooks when an impasse is encountered. However, It has revealed that students do not use textbooks spontaneously and only use superficial information. This study investigated the effects of utilizing mathematics textbooks in class on students' spontaneous use of textbooks and quality of textbooks strategy use. Thirty-seven 8th-grade students were assigned to either an experimental group, in which they were shown which parts in a textbook were beneficial for overcoming misunderstanding and participated in collaborative learning using textbooks, or a control group (regular math instruction). The results showed marginally significant increase of the frequency of spontaneous textbooks use when an impasse in experimental group. The results also revealed that students in the experimental group reread information about concept knowledge to acquire deep understanding. The result suggested that students' quantity and quality of textbooks use was improved through experimental class. In both classes, teacher taught the effectiveness of textbooks use. It implied that instruction of effectiveness is not sufficient and teacher should utilize textbooks in the class to make students internalize textbooks use strategy.

Involving elementary and secondary school students in co-design: A systematic literature review

Keywords: Design based research, Instructional design, Primary education, Secondary education

Presenting Author: Andria Agesilaou, Cyprus University of Technology, Cyprus; **Co-Author:** Eleni Kyza, Cyprus University of Technology, Cyprus

This study presents a systematic review on the merits of co-designing with elementary and secondary school students. Co-design is an approach to designing and developing innovations that are tailored to the end users' preferences and needs, by involving them in various phases of the design process. Despite the fact that children have been reported to have been involved in various studies during the last twenty years, the literature lacks studies which systematically investigate students' involvement in co-design, including how this can be achieved and what benefits and challenges this process entails. The present study seeks to fill that gap by reviewing empirical studies of elementary and secondary school students, conducted during the last twenty years. Out of the sixty-eight retrieved publications, a total of thirty-three studies met the inclusion criteria. This review reports on: research areas and questions that are being pursued in co-design

studies; participation structures and roles; how the co-design process is organized and supported, and what lessons are learnt. Literature review leads to the conclusion that children's participation in co-design activities has the potential to: improve the current instructional practice; develop technologies that meet children's needs and improve children's collaboration, communicational, emotional and cognitive skills. The present review effort bears significant implications to the process of co-designing with children, as it draws on empirical evidence. Such a framework can contribute to the existing literature and provide implications and practical guidelines to instructional researchers and teachers who want to transform the top-down structures of education.

Do dyads increase the chances of coherence formation with multiple representation material?

Keywords: Collaborative Learning, Cooperative / collaborative learning, Peer interaction, Social interaction

Presenting Author:Christopher Williams, University of Ulm, Germany; **Co-Author:**Tina Seufert, University of Ulm, Germany

When learning with multiple representations, coherence formation is considered an essential cognitive process, which involves learners' attempt to make sense of various written and visual learning material. Working in dyads has shown to affect such cognitive processes such as coherence formation, because group learners have to externalize their comprehension processes and come to an overall common, hence coherent shared representation in a process of grounding. The question to be examined is what effects do dyads working with multiple representation learning materials have on the learners' coherence formation process. We assume better performance for recall and comprehension as well as for local and global coherence formation and we also expect longer time-on-task of dyads. In our experiment, 25 participants were either assigned to learn individually or in a dyad. They were asked to think aloud and were also video-recorded. Results showed that there is an effect of learning in dyads with better scores for almost all learning outcomes and longer time-on-task. Based on these initial results, a closer examination of the social interaction processes in dyads based on thinking aloud protocols and video data will be conducted. We will particularly focus on the learners' grounding process and their co-regulatory occurrences.

Fostering Teachers' Ability to Develop Learning Tasks and Establish Learning Tasks in their Lessons

Keywords: Student learning, Teacher Effectiveness, Teacher Professional Development, Teaching / instruction

Presenting Author:Gregor Damnik, TU Dresden, Germany; **Co-Author:**Antje Proske, TU Dresden, Germany; **Co-Author:**Hermann Körndle, TU Dresden, Germany

Effective teaching particularly means that students are engaged in higher-order thinking processes during the lesson. For this purpose, well-developed learning tasks are required. However, teachers are usually not trained to select and create learning tasks that foster students' engagement in higher-order thinking processes. In the present paper, it is investigated whether or not teachers' ability to develop learning tasks and establish learning tasks in a lesson can be fostered by training. In order to analyze teachers' ability, their knowledge as well as their developed tasks were examined and compared with a control group as well as with learning tasks which were created by an expert on task development. The preliminary results indicate that participants' ability to develop learning tasks can effectively be fostered. However, more analyses are required in order to compare participants' tasks with the tasks which were created by the expert.

Game-based learning arrangements in financial education: A design-based research approach

Keywords: Cognitive skills, Design based research, Game-based learning, Instructional design

Presenting Author:Carmela Aprea, Friedrich Schiller University Jena, Germany; **Co-Author:**Julia Schultheis, Friedrich-Schiller-University Jena, Germany; **Co-Author:**Kathleen Stolle, Friedrich-Schiller-University Jena, Germany

One shortcoming of traditional financial education programs is that they are usually centred on the acquisition of factual knowledge, whereas higher order learning goals are mostly omitted. They often also do not sufficiently consider students' motivation, needs and practices. Based on instructional research studies confirming the positive cognitive and motivational effects of game-based learning in other domains, we assume that serious games can offer one possibility to overcome these obstacles. However, these benefits do not come naturally but require careful design of respective learning arrangements (i.e., game design and design of game-related instruction). In addition, none of the studies has addressed financial education. Consequently, the aim of our study is to investigate how game-based learning should be designed in order to be successfully used in financial education. The study employed a design-based research approach. Among others, it included the formative evaluation of four game-based learning arrangements in a secondary school financial education program in Switzerland, which intended to test the practicability of these arrangements and to get a first impression on their effectiveness in terms of learning and motivation. The study supports the claim that well-designed and instructionally integrated serious game can support secondary school financial education, but that sufficient time is needed for students and teachers to familiarise with the requirements of this type of learning. Its findings can be used for further development of the game-based learning arrangements and for experimental research on their effectiveness. They also indicate a need for teacher education/development in this context.

Keywords: Collaborative Learning, Computer-supported collaborative learning, E-learning / Online learning, Lifelong learning

Presenting Author:Elsebeth Korsgaard Sorensen, Aalborg University, Denmark

Abstract Many flexible designs of online learning offer no possibilities for interaction and collaboration among students. Others do so, but have problems - even when interaction occurs – in qualifying a truly collaborative knowledge building dialogue. This paper deals with the question of how to qualify a knowledge building dialogue as a result of providing meta-awareness around the functions of comments in the dialogue. The paper suggests that meta-awareness around this actually contributes to qualifying a knowledge building process in online collaborative learning. The data and methodology used are hermeneutic-phenomenologic content analysis of student-generated knowledge building comments in evolving tapestries of dialogue. Wittgenstein's notion of language games is used as framework to capture and identify the analytical units of the dialogic threads. **Keywords:** collaborative learning, knowledge building, dialogue, meta-communication, reflection, inclusion, digital

Predicting learners' motivation from their typing behaviour in web based learning environments

Keywords: Learning analytics, Learning Technologies, Metacognition, Self-regulation

Presenting Author:Markus Hörmann, Technical University of Munich (TUM), Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

Adaptive learning systems support learning by fitting the presented environment to learners' diverse prerequisites. To make reasonable adaptations, valid sources should give us relevant and accurate information about learners. Capturing the typing behaviour while learners work on exercises offers an unobtrusive, non-reactive real-time source that could contribute such information. In a field study, we analysed the typing behaviour of 38 undergraduates who learned about programming with a web-based environment for 60 minutes. Typing behaviour was recorded while writing program-code (six coding-tasks) and regular text (recall-task). We linked different indices of typing behaviour (e.g. frequency of corrections or pauses) with measures of motivational states. Initial motivation was assessed before learning using the Questionnaire of Current Motivation (QCM, Rheinberg, Vollmeyer, & Burns, 2001) and current motivational state before each of the typing tasks using a short measure of three items. Results reveal significant correlations between different typing-indices and the motivational measures. Correlations were positive for typing in recall-tasks and initial motivation ($r = .374$). In addition, negative correlations were found for writing program-code and current motivation ($r = -.540$ to $-.354$). This indicates that typing behaviour has to be interpreted task-specifically. Following the indications of this study, mining the keyboard-data could be used to assess different learner states and hence to offer a range of possibilities to support learners in future adaptive learning environments.

The Relationships between Exploration and Learning Strategies in a Problem-Solving Environment

Keywords: Higher education, Learning approaches, Motivation, Problem solving

Presenting Author:Gyongyver Molnar, University of Szeged, Hungary; **Co-Author:**Eniko Bus, University of Szeged, Hungary; **Co-Author:**Erzsébet Korom, University of Szeged, MTA-SZTE Science Education Research Group, Hungary; **Co-Author:**Benő Csapó, University of Szeged, Hungary

In this paper, we examined the relationships between exploration strategies and different learning styles in a problem-solving environment. The aims of the study were to determine (1) qualitatively different exploration strategies by analysing log files and investigating the number of latent profiles into which first-year university students could be meaningfully divided and (2) the relationships between the quality and effectiveness of the exploration strategy used and different learning styles, including different learning strategies (memorization, elaboration and control), and levels of mastery motivation (task persistence, preference for challenge, task-related pleasure, self-efficacy, task absorption and motivation level during testing). The samples for the study were drawn from first-year university students ($N=1729$, $M_{age}=19.5$, $sd_{age}=1.87$). The instruments were a complex problem-solving test (20 items) and a learning style questionnaire (45 items, including questions on learning strategies and mastery motivation). Latent class analyses, ANOVA, factor analyses and bivariate correlations were used for the analyses. The reliability of the instruments is high ($\alpha_{CPS}=.90$;

$\alpha_{\text{learning_style}}=.92$). Four qualitatively different class profiles were identified: proficient explorers (65.6%), low-performing explorers (13.7%), rapid learners (9.9%) and non-persistent explorers (10.8%). Students who often use memorization strategies in their learning proved to be less developed explorers and problem-solvers ($r=-.20$, p

Electrodermal Activity Arousal throughout a Full Physics Course: A Clue for Learning Regulation?

Keywords: Collaborative Learning, Learning analytics, Self-regulation, Technology

Presenting Author:Héctor Javier Pijera Díaz, University of Oulu, Finland; **Co-Author:**Paul A. Kirschner, Open University of the Netherlands, Netherlands; **Co-Author:**Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Hendrik Drachler, Open University of the Netherlands, Netherlands

Self-regulated learning (SRL) research has been searching for data which is complementary to self-reports and simple digital traces, techniques recognized for their limitations in reliability and representative sufficiency. One approach gaining attention is physiological data. Electrodermal activity (EDA) is a physiological response indicating cognitive, affective and/or physical arousal (i.e., states of activation such as stress or anxiety). Peaks in EDA might indicate perceived challenges which are known to invite self-regulation activities. Although extensively used in psychophysiology, studies have rarely focused on EDA in authentic learning situations. This paper reports on one student (of 12) who was tracked in the 19 collaborative learning sessions of a regular high school advanced physics course, known to be cognitively demanding. EDA peaks showing arousal were detected. The number of peaks ranged from 12 to 337 per session and the amplitudes from 1.78 to 11.13 μ Siemens across sessions. Lower session values might indicate boredom or lack of interest while higher ones might show stress, engagement and/or high cognitive/emotional load in the respective sessions. These results point to a potential for teacher intervention and a more balanced instruction design across lessons.

Reading on Paper or on Tablet: An Eye-tracking Study

Keywords: Educational Psychology, Experimental studies, Learning Technologies, Reading comprehension

Presenting Author:Pablo Delgado Herrera, University of Valencia, Spain; **Co-Author:**Ladislao Salmeron, University of Valencia, Spain

While a wide-spread assumption considers that reading on digital mediums induces shallower processing than on paper (e.g. Ackerman & Lauterman, 2012), previous literature reveals inconsistent results regarding the effects of medium on text comprehension (e.g., Kretschmar et al., 2013). As a way to understand such effects, we analysed the on-line reading processes on the different mediums. We tested two complementary hypotheses: (1) Strategic hypothesis: Participants will show less strategic reading on tablet than on paper, specially when reading the structurally relevant parts of the texts, e.g. titles (Hyönä, Lorch, & Kaakinen, 2002); and (2) Easiness processing hypothesis: Participants will show a higher global reading rate on tablet than on paper (e.g. shorter fixation times, less number of fixations). In a within-subject study, 35 undergraduates read three expository texts on paper and three on tablet, while their eye-movements were tracked. For each text, they rated their expected comprehension scores and answered a set of multiple-choice comprehension questions. Even though eye-tracking data revealed no differences when looking at participants' reading of the text paragraphs, results indicated that participants' first-pass fixation time, first-pass number of fixations and lookback fixations on texts' titles were longer and higher when reading on paper than on tablet. We also found longer first-pass fixation duration when participants read the last sentence of each paragraph on paper. This pattern of results supports the strategic hypothesis. Notwithstanding, no differences between mediums were found in the scores in comprehension questions or in the metacognitive judgements.

Cue detection of emergency care clinicians during a simulation based critical incident

Keywords: Informal learning, Mixed-method research, Problem solving, Video analysis

Presenting Author:Anneke van der Niet, Maastricht University, Netherlands; **Co-Author:**Ellen Kok, Utrecht University, Netherlands; **Co-Author:**Jeroen Van Merriënboer, Maastricht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

The aim of this study is to examine the detection of relevant information by expert and competent non-expert emergency care clinicians during two simulated diagnostic scenarios. One scenario involves a situation that all clinicians encounter frequently and can be executed more or less routinely, while the other scenario will involve a critical incident that requires a more effortful mode of acting. In both scenarios, the information acquisition pattern of experts and competent non-experts will be examined using eye tracking, video observation and cued retrospective reporting. It is expected that during the routine scenario both groups of clinicians will display quite similar gaze patterns, due to the experience of both groups with this particular situation. Also, execution of the tasks will show similarities. However, during the scenario involving a critical incident, it is hypothesized that experts will show a different gaze pattern compared to the competent non-experts. Experts most likely will direct their attention to more relevant cues that will guide their actions.

Online learning students in Russia: who are they?

Keywords: E-learning / Online learning, Higher education, Student learning, Survey Research

Presenting Author:Polina Pekker, Lomonosov Moscow State University, Russian Federation; **Co-Author:**Lyudmila Popova, Lomonosov Moscow State University, Russian Federation

Massive open online courses (MOOC) have become popular around the world because they provide access to education to students from different social groups. Russian National platform «Open education» started to work in September 2015 and eight leading Russian universities downloaded 47 courses (107 courses in October 2016). We analyzed the reasons, why

students choose online-course and also identified average characteristics of Russian online students (Case of «Modern environmental problems and sustainable development»). This study was based on quantitative research, a freewill survey was used (156 respondents (59% of students who finished the online-course in 2015)). The results of the study showed that the majority of MOOC students were 21-25 years old (45%) and 26-30 years old (19%). The respondents were mostly women (75%) and significantly less men (25%). MOOC students were students from Russian universities (59%). Their purpose of learning was to get the course certificate and to credit course at their university. The course choice was determined by several factors: a professional interest, the ability to study online, the ability to take a course with professor from different university and to understand the actual problems. 28% of online students were employees and they trained to enhance their knowledge, despite the fact that they had no free time. The results of research showed that MOOC students were mainly from Moscow region (54%), while online learning provides equal opportunities to all residents from different social groups from any Russian region and all over the world.

Estonian pre-service teachers' evaluations on their knowledge areas according TPACK framework

Keywords: Competencies, Pre-service teacher education, Quantitative methods, Technology

Presenting Author: Piret Luik, University of Tartu, Estonia; **Co-Author:** Merle Taimalu, University of Tartu, Estonia

In this presentation we discuss about the pre-service teachers evaluations on their knowledge areas according to TPACK framework, which integrates content, pedagogy and technology. Longitudinal study was carried out in Estonia. The sample of this study consisted of 381 first year pre-service teachers, who filled in questionnaires. The second data collection was when the pre-service teachers started their second year studies. 123 students answered twice. CFA reached on three-factor model: integration of technology, pedagogy and content. Data was analyzed using MANOVA and t-test. Both the TPACK framework and this study help to develop teacher training curricula and indicates, that pedagogical knowledge needs to be enhanced in teacher education in Estonia.

Teachers' Professional vision and its effect on their classroom management

Keywords: Mixed-method research, Qualitative methods, Teacher Professional Development, Video analysis

Presenting Author: Saskia Brand-Gruwel, Open University of the Netherlands, Netherlands; **Co-Author:** Johan van Strien, Open University of the Netherlands, Netherlands; **Co-Author:** Sharisse van Driel, Open University, Netherlands; **Co-Author:** Charlotte Wolff, Open University, Netherlands; **Co-Author:** Halszka Maria Jarodzka, Open University of the Netherlands, Netherlands

Classroom management is challenging for many teachers, yet crucial for pupils' learning. Important for classroom management is teachers' professional vision, including noticing/seeing and interpreting of relevant events. Previous studies showed that student and expert teachers differ largely in their professional vision with respect to classroom management. However, in these studies, teachers' professional vision was investigated by watching videos of *other* teachers; Thus far, little is known about teachers' professional vision with respect to their *own* classroom management and how this relates to their level of teaching expertise. This proposal describes the set-up and to-be-collected data (i.e., a data paper) of a research project which seeks to investigate how the professional vision of teachers-in-training differs from beginning and expert teachers, and what is the longitudinal development of in-training-teachers' professional vision. Four studies will be conducted among 60 teachers (20 teachers-in-training; 20 beginning; 20 experienced teachers): two in teachers' actual classrooms, in which teachers conduct a 1-hour lesson while wearing mobile eye-track glasses After the lesson, teachers will select four events from their recordings that they consider as having been crucial for their classroom management. During retrospective verbal reports teachers will watch each event and report on what they see and why it is relevant for classroom management. Two other studies will use video recordings of other teachers' teaching. Eye-tracking data, verbal data, video recordings, and teacher characteristics will be collected and analyzed. Together, these studies will provide more insight into the development of teachers' professional vision.

Study about School Career: Generation 2012-2016

Keywords: Assessment methods and tools, Competencies, Pre-service teacher education, Primary education

Presenting Author: Edith Arévalo Vázquez, Escuela Normal Miguel F. Martínez, Mexico; **Co-Author:** Hilda Alicia Guzmán

Elizondo, Secretaría de Educación Pública, Mexico; **Co-Author:**Nancy Bernardina Moya González, Secretaría de Educación Pública, Mexico; **Co-Author:**José Luis Domínguez Aguirre, Escuela de Graduados de la Escuela Normal Superior "Profr. Moisés Sáenz Garza", Mexico

In the present study we explore the school career of the first generation of graduated from the Study Plan 2012 implemented in Mexico for the Normal Schools of the Country. The generation is made up by 268 students of the Bachelor Degree in Primary Education and of 96 students of the Bachelor Degree in Pre-school education. The instruments used for this analysis were a public-opinion poll applied to teachers, documentary review on the academic career of the graduated students and statistical information on their insertion to the professional educational service. According to the statistical results on the academic behavior is observed that the initial educational formation that the students received during his professional career is coherent with the expected profile of the graduate, due to 95.77 % of the graduated students is incorporated in the Professional Educational Service, getting a job at basic education by means of examination of opposition. This research takes part of an investigation about the evaluation of the Curriculum 2012, in its first generation. The results will offer useful information for the taking of decisions and the strengthening of the curriculum. Key words: Initial educational formation, school career, curriculum.

Inclusive teamteaching - A theoretical review

Keywords: At-risk students, Competencies, Special education, Teaching approaches

Presenting Author:Teija Koskela, University of Eastern Finland, Finland; **Co-Author:**Hanna-Maija Sinkkonen, University of Tampere, Finland, Finland

The purpose in this theoretical paper is to create a framework to develop further the idea of teamteaching for more multiprofessional meaning in inclusive context. The national core curriculum in Finland underlines multiprofessional co-operation and listening to students. The issue is current in teacher education. Making full participation possible for all students is the meaning of our reconsideration of the concept of teamteaching. Especially the role of class assistant seems to be crucial. When teachers organize their work listening to students own voice is important. In everyday school work the assistant is the person who has tight relation to students considering their special educational needs. On that account, there is need to create more dialogical interaction between teachers and assistants. In this paper we transform the model of prequisites for inclusive teamteaching as a tool of meeting all students' educational needs. Strengthening the position of school assistants as a part of teamteaching is an issue we scrutinize in our theoretical review. We focus on working methods which best enable utilizing assistants knowledge of students' abilities and needs in teamteaching. We present a model which includes collaborative approach to planning, awareness of guidance, effective use of learning methods and teaching arrangements.

Teachers' subject-specific language awareness in technical vocational education

Keywords: Literacy, Qualitative methods, Teaching / instruction, Technology

Presenting Author:Elly Wildeman, Fontys University of Applied Sciences, Netherlands; **Co-Author:**Maaïke Koopman, Eindhoven University of Technology, Netherlands; **Co-Author:**Douwe Beijaard, Eindhoven University of Technology, Netherlands

Teachers' Language Awareness (TLA) is essential for improving students' subject-specific language development. This study focuses on the development of instruments to investigate Teachers' Subject-specific Language Awareness (TSLA) in technical vocational education. For this purpose, interview data were collected about teachers' general knowledge and beliefs about TLA, their learning objectives of lessons they taught, their interactions with students through classroom observations, and video-stimulated interview data to capture their knowledge underlying fragments of their observed teaching behaviour. Based on these data sources, portraits were constructed to see if these data, in their combination, could provide a rich picture of technical teachers' TSLA in terms of their knowledge, beliefs and behaviour concerning language development of their students when teaching their subject. The study concludes that these portraits provide a comprehensive and coherent insight into technical teachers' Subject-specific Language Awareness. The instruments made it also possible to discriminate among teachers' level of TLA. Teachers appeared to differ in their knowledge about relevant subject-specific language skills and functions, in their responsibility concerning their students' language development and in the way their instructional behaviour supports student subject-specific language learning. This indicates that, in their combination, the data sources underlying the portraits are not only comprehensive and coherent, but that they are also detailed in the picture they provide.

Introducing an Instrument for Measuring Academic Integration in Pre-Service Teachers

Keywords: Assessment methods and tools, At-risk students, Pre-service teacher education, Teacher Professional Development

Presenting Author:Sandra Dietrich, University of Leipzig, Germany

Low retention rates in teacher training for secondary schools are a challenge of the German educational system. Finishing rates are as low as 50% and even lower in the high demand STEM-subjects. Failed academic integration could be a predictor for drop out from teacher education. Hence, this presentation aims at introducing and discussion a new instrument for measuring academic integration in pre-service teachers.

Academic integration is defined by the extend to which a student engages in social interactions with fellow students (Social

Belonging) and whether she is putting effort into education related activities (Academic Dedication). The scales were tested for factorial validity and reliability on a sample of 140 students (female =103; mean age = 21 (SD = 3.54)) in an online survey. Unfortunately, only the scale Social Belonging showed adequate reliability and could be used for further preliminary analysis. For the scale Academic Determination further adjustments are needed, for one increasing the number of items. Further directions and ways to improve the scales will be discussed.

The place for music education among school subjects in students' views

Keywords: Arts, Assessment methods and tools, Attitudes and beliefs, Emotion and affect

Presenting Author:Tünde Pintér, University of Szeged, Hungary; **Co-Author:**Csaba Csíkos, University of Szeged, Hungary

The aim of this study was to assess the recent prestige of music education among students in Hungary, as well as to reveal their opinion about the quality of music lessons. Data were obtained from questionnaires filled out by 501 elementary school students aged 7–14 from one school. Questionnaires focused on the attitudes and satisfaction of students regarding school subjects. It can be concluded from these results that music is rarely selected by students as their favourite school subject. Furthermore, younger students reported more positive attitude towards music, but with increasing age their attitudes decreased. Many students complained about the unanimity of music lessons, and they considered the quality of teaching inappropriate.

Goal theory and impostor phenomenon during surgery residency: Does self-doubt make me a fraud?

Keywords: Achievement, Goal orientation, Motivation, Self-regulation

Presenting Author:Michael Dempsey, Boston University, United States; **Co-Author:**Douglas Kauffman, Boston University, United States

Impostor phenomenon characterizes persons who feel like intellectual frauds, and for whom achievement tasks can elicit anxiety and emotional distress. Empirical research related to the phenomenon is scant in Graduate Medical Education, though it is often referenced indirectly in studies of personality traits across diverse medical fields. We sought to better understand how residents experience impostor phenomenon during residency training. We conducted in-depth qualitative interviews with 16 resident physicians from two tertiary-care academic medical institutions. Participants were asked to reflect on team leadership experiences in a trauma setting, which we anticipated would elicit rich descriptions of cognitive and emotional behavior. An interdisciplinary team subjected transcriptions to phenomenological thematic analysis through an iterative, rigorous process. Analysis revealed three major themes related to impostor phenomenon in residents' experiences with team leadership: Transition Events, Achievement-Related Competence and Coping Strategies. A modified member-checking strategy confirmed these themes were consistent with surgical residents' experiences.

Implicit beliefs about giftedness and intelligence among Finnish high achieving students

Keywords: Achievement, Conceptual change, Intelligence, Motivation

Presenting Author:Elina Kuusisto, University of Helsinki, Finland; **Co-Author:**Sonja Laine, University of Helsinki, Finland; **Co-Author:**Kirsi Tirri, University of Helsinki, Finland

This paper presents the results of a study in which Finnish high achieving upper secondary school students' (N=151) implicit beliefs about giftedness and intelligence were examined. The theoretical background of the study lies in Carol Dweck's theory of implicit beliefs, and accordingly the study utilized Dweck's instrument. The results indicated that the students saw intelligence as malleable ($M=4.24$, $SD=0.96$), but giftedness more as fixed ($M=3.21$, $SD=1.31$). The study identified potentially vulnerable group of high achieving students, having fixed orientation toward both intelligence and giftedness. One fourth of the students had this orientation and might be at risk of avoidance of challenges and even underachievement. The research highlights the importance of future research about how implicit beliefs affect students learning success during challenging upper secondary school years.

Effects of a Gender Stereotyped Math TV Show on Girls' and Boys' Math Achievement and Attitudes

Keywords: Achievement, Attitudes and beliefs, Mathematics, Motivation

Presenting Author:Eike Wille, University of Tübingen, Germany; **Co-Author:**Hanna Gaspard, University of Tübingen,

Germany; **Co-Author:**Kerstin Oschatz, University of Tübingen, Germany; **Co-Author:**Benjamin Nagengast, Eberhard Karls Universität Tübingen, Germany; **Co-Author:**Ulrich Trautwein, University of Tübingen, Germany

Women are underrepresented in mathematically-intensive STEM domains, which can be linked to early emerging gender differences in math motivation. Based on expectancy-value theory, there is ample research on how socialization influences girls' and boys' math motivation differently (c.f., Wigfield et al., 2015). Furthermore, there is extensive work on stereotype threats, indicating that negative math stereotypes affect females' math perceptions, motivation, and achievement (c.f., Steele et al., 2002). Television shows are a central factor in children's socialization, which contain also specific gender stereotypes. However, it is unclear to what extent television shows influence children's motivation and achievement in math. We therefore conducted an experimental study with a pretest-posttest control-group design to investigate differential effects of a gender stereotyped math television show on girls' and boys' math achievement, motivation and attitude as well as their stereotype endorsement. To this end, 335 fifth graders watched a television show about math either with or without an explicit gender-stereotyped section. We specified multiple regression analyses and tested main effects of gender and experimental condition as well as their interaction on all outcomes. Results indicate that watching a gender stereotyped television show affected girls' attitudes in math as well as their stereotype endorsement negatively. Positive effects were found on boys' attitudes in mathematics. Results offer first insights on how television shows influence girls' and boys' motivation and achievement for math, and how they may constitute one contributing factor to gender differences in the STEM fields.

The nature of students' pride and its interplay with motivation and learning

Keywords: Achievement, Parental involvement in learning, Student learning, Motivation and emotion

Presenting Author:Kerstin Helker, RWTH Aachen University, Germany; **Co-Author:**Judith Fraenken, RWTH Aachen University, Germany; **Co-Author:**Marold Wosnitza, RWTH Aachen University, Germany

Pride as a positive activating emotion is thought to promote both extrinsic and intrinsic motivation. Prior research has shown that students' pride in the school context mainly focuses on task- and school related topics. Based on this, the present study focuses on the interplay between students' pride and motivation and the effect on academic performance. Furthermore, it is examined if there are different types of students with regard to their pride and if there are further differences between them.

Pride statements of 42 school students were collected over a whole school year (=40 weeks) and were coded into an emerging category system. Additionally, students filled a survey about inter alia their responsibility ascriptions, motivation, test anxiety, sense of competence and whether they felt they were fulfilling their parents' expectations. In another survey, students' parents were asked inter alia to rate their child's ability and parents' expectations for their child.

Results show that there are two types of students in the light of what they state to be proud of. One of them focuses more on outcomes and achievement and furthermore feels competent and good in math. Additionally the parents of this type of student expect their children to be good in math and find parent involvement important. In contrast, the other type of students focuses more on the learning process. Those students have to try hard to get good grades in math and have bigger test anxiety. Their parents also think that their children have to exert themselves in math.

Dual trajectory of academic motivation and perceived competence: a longitudinal study

Keywords: Achievement, Attitudes and beliefs, Developmental processes, Motivation

Presenting Author:Nadia Leroy, Université Grenoble Alpes, France

The aim of this study is twofold: exploring the evolution of the different components of motivation during junior high school and analyzing the relationships between motivational trajectories and students' perceived competence trajectories in a dual model.

Based on the recent development of group-based trajectory model (Jones & Nagin, 2007; Jones, Nagin & Roeder, 2001 ; Nagin, 1999 ; Nagin & Tremblay, 2001), we address the role of perceived competence trajectories in motivational trajectories variations.

First, we will examine how the different kinds of academic motivation in mathematics fluctuate during junior high school. Second, we explore whether perceived competence trajectories might be influential for the motivation trajectories. In other words, the objective consist of (a) identifying trajectories of motivational profiles using a group-based approach (b) studying the relationship between the probability membership to each profile and students' perceived competence (c) combining the patterns of change in motivation and in perceived competence within a dual model.

The analysis will address several questions:

- Might students be autonomously motivated even if they report low level of perceived competence? and with which probability ?
- Might students display low level of autonomous motivation even if they report high level of perceived competence ?
- Might students simultaneously report high level of autonomous motivation while having low level of perceived

competence?

Analysis of Motivational and Cognitive Processes in Collaborative Learning

Keywords: Collaborative Learning, Educational Psychology, Mixed-method research, Motivation and emotion

Presenting Author:Etsuko Tanaka, Nagoya University, Japan; **Co-Author:**Emmanuel Manalo, Kyoto University, Japan

Previous studies point to the influence of collaborative learning on motivation and cognition but the processes involved remain to be fully elucidated. The purpose of this study was to examine the changing process of interest and its relationship with cognition by analyzing participants' change in interest and self-efficacy every 5 minutes, and their speech and behavior during collaborative learning. Twelve pairs of 24 undergraduate and graduate school students participated in the experiment. They learned about JavaScript by reading a textbook individually for 25 minutes and then were asked to solve an applied problem collaboratively for another 25 minutes. During collaborative learning, students evaluated their interest and self-efficacy pertaining to the applied problem every five minutes, and their speech and behavior were recorded. Collected data were analyzed qualitatively. The results indicate that interest is enhanced by sharing thoughts and understanding with each other at the beginning of collaborative learning. When they are stuck and their self-efficacy decreases, conversation focusing not only on superficial procedures for generating an answer but understanding of each meaning of protocol leads to new awareness and maintenance of interest levels. By analyzing change of motivation during learning, and speech and behavior which reflect their cognition together, we can gain insight about motivational and cognitive processes involved in collaborative learning.

Examining Learners' Physiological Activation during an Interaction with a Mobile AR App for Learning

Keywords: Educational Technology, Emotion and affect, Learning Technologies, Motivation and emotion

Presenting Author:Susanne Lajoie, McGill University, Canada; **Co-Author:**Jason Harley, University of Alberta, Canada; **Co-Author:**Amanda Jarrell, McGill University, Canada; **Co-Author:**Tara Tressel, McGill University, Canada; **Co-Author:**Laura Pipe, McGill University, Canada; **Co-Author:**Chayse Haldane, The University of Alberta, Canada; **Co-Author:**Eric Poitras, University of Utah, United States

Understanding the physiological component of emotion and its relationship with learning is critical, but also challenging given the diversity of available approaches to measure it and the paucity of guidance from theories of emotion regarding physiological-specific assumptions. The authors contribute to addressing this gap by examining the relationship between learners' physiological activation and their random assignment to one of two different learning conditions during an interaction with a mobile augmented reality application for history learning. Physiological activation was captured using a bracelet that recorded learners' electrodermal activation (EDA). EDA data was processed and analyzed from a subsample of six out of 44 participants collected in an ongoing study. The two conditions varied based on the nature of the historical reasoning prompts provided by a human guide to users of the mobile AR application. The control condition provided shallow, comparison-based prompts while the extended prompt and feedback (EPF) condition drew on a broader and deeper set of historical reasoning prompts to foster more active learning, cognitive engagement, and deeper levels of historical reasoning. Preliminary results revealed that learners tended, across conditions, to experience moderately elevated mean levels of physiological activation during their interaction with the mobile AR app. Self-reported emotion data revealed that mean EDA levels likely reflected instances of positively-valenced activation (e.g., enjoyment) rather than negatively-valenced activation (e.g., frustration). These findings provide converging support that the mobile AR app and guide interaction fostered positive emotions as well learning about history.

The role of inhibitory control in learning counterintuitive science and math concepts in adolescence

Keywords: Cognitive skills, Conceptual change, Mathematics, Science education

Presenting Author:Annie Brookman-Byrne, Birkbeck, University of London, United Kingdom; **Co-Author:**Andy Tolmie, UCL Institute of Education, United Kingdom; **Co-Author:**Denis Mareschal, Birkbeck, University of London, United Kingdom; **Co-Author:**Iroise Dumontheil, Birkbeck, University of London, United Kingdom

Science and math learning requires the integration of new evidence about the world into one's existing theories. According

to the traditional view of learning, naïve theories are replaced in the face of new evidence. However, recent behavioural and neuroimaging research suggests that old theories remain even when new ones are learnt. When correctly solving counterintuitive science problems, expert scientists recruit the lateral prefrontal cortex and anterior cingulate cortex. These areas of the brain are associated with conflict monitoring, error detection and inhibitory control, the ability to stop prepotent response. Inhibitory control therefore may enable the suppression of theories in the processing of counterintuitive material. Individual differences studies suggest that inhibitory control is associated with reasoning about counterintuitive concepts in adolescence, but the relation between inhibitory control and *learning* new counterintuitive concepts is largely unknown. Four classes, comprising 96 adolescents (12-14 years old) were given measures of response and semantic inhibition. Counterintuitive concept understanding was measured one week before, one week after, and one month after a lesson on a mathematical or scientific counterintuitive concept. Analyses focused on the extent to which individuals' inhibitory control performance predicted their improvement on the counterintuitive concept test following the lesson. A better understanding of how inhibitory control affects learning of counterintuitive concepts may be informative for teaching practices.

Associations between digits are fundamental for mathematical ability

Keywords: Cognitive skills, Experimental studies, Mathematics, Numeracy

Presenting Author:Bert Reynvoet, KU Leuven, Belgium; **Co-Author:**Helene Vos, KU LEUVEN, Belgium; **Co-Author:**Delphine Sasanguie, KU LEUVEN, Belgium; **Co-Author:**Tom Heyman, KU LEUVEN, Belgium; **Co-Author:**Wim Gevers, ULB Brussels, Belgium

Over the past few years there has been a growing interest in the relation between mathematical ability and the ability to process order information. Several studies have shown that digit order processing is strongly related to individual differences in mathematical ability. Currently, different mechanisms underlying the processing of ordered sequences are proposed. One explanation is that ordered sequences are processed by a serial scanning mechanism, suggesting that participants scan the counting sequence item by item. An alternative explanation assumes that ordered sequences are processed through associations between the items. The aim of this study was to disentangle these explanations by looking at the processing of ascending sequences (e.g. 1-2-3) and descending sequences (e.g. 3-2-1) separately. Participants had to indicate whether a sequence of three digits was presented in the correct order or not. Ascending, descending and non-ordered trials were presented. Additionally, half of the trials for each direction were small distance sequences, the other half were large distance sequences. Results revealed reversed distance effects (i.e. better performance on small distance trials than large distance trials) for ordered sequences. Ascending sequences elicited faster performance and stronger reversed distance effects than descending sequences, suggesting that associative mechanisms underlie order processing. To further verify whether associations underlie order processing, it was investigated whether performance on the different trials of the order judgement task was predicted by word association norms. These word associations norms predicted the performance on the order judgement task confirming that associations underlie digit order processing.

An EEG study of cognitive load during arithmetic calculation aided by brackets or visual spacing

Keywords: Educational Psychology, Experimental studies, Mathematics, Neuroscience

Presenting Author:David Maximiliano Gomez Rojas, Universidad de Chile, Chile; **Co-Author:**Arturo Perez, Universidad de Chile, Chile; **Co-Author:**Alvaro Rivera-Rei, Universidad Diego Portales, Chile; **Co-Author:**Pablo Dartnell, Universidad de Chile, Chile

Research has shown that the visual display used to present mathematical expressions affects how these expressions are cognitively processed. In particular, arithmetic precedence rules are slower to be applied, or more likely to be misapplied, to mixed addition/multiplication arithmetic expressions (e.g. $2+3 \times 5$) whose symbol spacing imposes tighter visual packing of addition (e.g. $2+3 \times 5$) rather than multiplication (e.g. $2 + 3 \times 5$). Symbol spacing has also proved to play a role in children's responses to a mixed-operation arithmetic test, particularly in children who do not apply precedence rules correctly. From an educational stand, symbol spacing might thus provide a way to scaffold the learning of arithmetic precedence in elementary school. Still, it remains to be proved whether this is a more desirable or effective way to achieve this goal than others that have been proposed, such as the use of mathematically-unnecessary brackets (e.g. $2+[3 \times 5]$). We thus conducted an electroencephalography (EEG) study to investigate the cognitive load induced by these different presentation formats in arithmetic calculation by Engineering undergrads. In this poster, we will present preliminary data on event-related potentials and neural oscillations contrasting these presentation formats.

The neuroscience of motor-expertise in real-world tasks

Keywords: Higher education, Neuroscience, Professions and applied sciences, Quantitative methods

Presenting Author:Ellen Kok, Utrecht University, Netherlands; **Co-Author:**Anique de Bruin, Maastricht University, Netherlands

Expertise research has led to increased insights into the mechanisms causing expert performance. Recently, neuroscience methods such as fMRI have enabled us to investigate the brain correlates of expert performance. Expertise research has a tradition of using ecologically valid domain-specific tasks. This poses a challenge for neuroscience research, in particular when it comes to studying motor expertise. How can motor expertise be investigated when a participant must lie still in an fMRI scanner? In this presentation, we provide an overview of three broad experimental paradigms for investigating the neuroscience of motor expertise in real-world tasks in an fMRI scanner: action observation, motor imagery and task execution. Action observation paradigms require participants to watch video-clips of domain-specific movements. In some

of these tasks, participants are also required to anticipate the direction of motion. These studies typically find increased activity in the action-observation network with increased expertise. Motor imagery paradigms depart from the finding that motor imagery and motor execution recruit (partly) the same networks. Studies on motor imagery find increased activity with increased expertise in motor regions such as the premotor cortex. Finally, several studies managed to have their participants actually execute a domain-specific task. These studies typically look at neural efficiency, and find decreased activity in areas such as the primary motor cortex, as well as control regions such as the basal ganglia. Together, these studies provide insight into the brain correlates of expert performance in real-world motor tasks.

Integrating Impulses and Dilemma Stories for Values Education in STEM Context

Keywords: Qualitative methods, Reflection, Teaching approaches, Values education

Presenting Author:Heinz Mandl, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Katrin Wallner, Ludwig-Maximilians-University Munich, Germany; **Co-Author:**Birgitta Kopp, Ludwig-Maximilians-University, Germany

Sensitizing children for values is a main aim of education. Specifically, in school education values have a long tradition in order to guarantee a justified and peaceful living together. In STEM context, values receive a more specified focus as decisions in natural scientific subjects have not only effects on individuals, but also on society and on earth. To foster the sensitization of values in STEM context, we didactically enriched experimental material for students in the 4th grade of elementary school with impulses and dilemma stories. We evaluated the realization of two experiments in STEM with impulses and dilemmas in a field study using qualitative observation and interview data. Overall, results indicated an effective integration of impulses and dilemma stories in order to foster values education. In more detail, results showed that a combination of impulses and dilemma stories was effective for students to take the perspective of the protagonists in the dilemma story and discuss diverse opinions showing environmental consciousness or self-activity. Furthermore group discussion in contrast to class discussion showed better results in reflecting on problem solutions integrating value issues of e.g. environmental consciousness. And the students' activity is of importance to stimulate reflection on values. Thus, the study gives first indications that impulses and dilemma stories are adequate didactical methods in order to foster values education in STEM context.

The importance of a transitional phase from limited to full installation of ICT in classrooms

Keywords: Educational Technology, Primary education, Teacher Professional Development, Teaching / instruction

Presenting Author:Taku Sugimoto, Aoyama Gakuin University, Japan

This study is an in-depth analysis of the process of implementing interactive white boards and tablet PCs at a Japanese primary school, focusing on the nature of institutional efforts and teachers' learning. Analyses are made on three-year data from classroom observations, teacher interviews, teacher and student surveys, and participatory observations of teachers' workshops. It is found that a gradual process from limited installation to full adoption, during which teachers made various attempts and shared ideas and practices, played an important part in teachers' shift in conceptualization of learning, teaching and technology, which leads to extensive and effective use of ICT in classrooms. Institutional supports during this process are shown to be important in fostering teachers' sustaining efforts toward better practices.

Social development in school: A comparison of civic competences between 8th and 12th grade students.

Keywords: Citizenship education, Quantitative methods, Secondary education, Social development

Presenting Author:Dorien Sampermans, KU Leuven, Belgium; **Co-Author:**Ellen Claes, KU LEUVEN, Belgium

The civic engagement of future generations is a crucial element in democratic societies. Therefore democratic countries attach much importance to the civic education of young adolescents in school. This paper aims to measure school influences on the social development of young adolescents. To create civic consciousness and engage secondary school students, teachers not only transfer civic knowledge. We increasingly assume schools to be a mini-polity, in which students can learn to interact with the society and where they learn to value their participation. It is by reaching these civic competences that students can become engaged citizens.

To measure social school influences, this paper compares the results of the Flemish ICCS 2016 data with the Flemish

educational effectiveness and evaluation survey. Both surveys measure civic knowledge and attitudes and are administered parallel in Flemish schools. The first study is administered among eight grade students, the latter among twelfth graders. Comparing the results of these studies reveals a growth of civic competences (civic knowledge, reported participation levels and students' self-efficacy) over age. And parallel to this higher critical consciousness, older students seem to perceive good citizenship more often as engaged citizenship. The relationship between students' engagement and their civic competences can be confirmed by a regression analysis and visualized in two structural equation models. Both path models then illustrate the dependency between students' perceptions of good citizenship and students' civic competences.

Categorizing student, Categorizing texts. Will Plagiarism Detection leave Blood on the Tracks?

Keywords: Morality, Social interaction, Technology, Writing / Literacy

Presenting Author:Lars-Erik Nilsson, Kristianstad University, Sweden; **Co-Author:**Anders Eklöf, Kristianstad University, Sweden; **Co-Author:**Tina Kullenberg, Kristianstad University, Sweden

Within research on examination cheating, a common assumption is that plagiarism in the context of examination is increasing epidemically. A uniform definition of plagiarism does not exist, but plagiarism is the category most frequently used when students at Swedish universities are notified and sanctioned for deception. Text Comparison is frequently presented as an effective technology for addressing plagiarism. Plagiarism Detection Services (PDS) are used for detecting text overlaps, particularly in higher education. While Higher Education Institutions in some countries appear to have uncritically accepted the use of text comparison technology, the reception in other countries have been ambivalent or even critical. The present project studies consequences of the use of text comparison through teachers meaning making regarding the pedagogical task to grade students and the moral task, to report students that try to deceive. We hypothesise that teachers' epistemological views are contingent on technology and discourses on technology. Text comparison technology, therefore, runs the danger of introducing consequential biases to the assessment of student performance. The material has been gathered in five focus group conversations. Focus has been introduced through the presentation of reports from a Plagiarism Detection System. A topical analysis has been performed on the transcribed conversations. From our results, we conclude that teachers' epistemological views are contingent on technology and discourses on technology. Text comparison, therefore, runs the danger of introducing a consequential bias to the assessment of student performance leaving students open to the accusation about deception.

Policy formation in times of transition: What education policy research can tell us.

Keywords: Attitudes and beliefs, Conceptual change, Content analysis, Educational policy

Presenting Author:Catherine Simon, Bath Spa University, United Kingdom

Policy research offers useful insights into the formation of a policy narrative. This conceptual analysis explores the intellectual antecedents which have informed Conservative Party education policy in England since 2010 It draws on an eclectic mix of liberal, conservative, radical and socialist discourse relating to notions such as citizenship, community, civil society and the role of the state in relation to these. Lévi Strauss's (1962) theoretical model of bricolage, Hall's (1998) agency of political ideas help uncover the inherent contradictions and limitations in current education policy and therefore may be used to inform policy implementation and development. This paper explores the formation of education policy at times of transition. Education has not been immune to the neoliberal project contained within globalisation. This is particularly so in England since the late 1980s. At a time when party politics in the West appears to be converging on the centre -right, a key question is how might education policy be constructed by newly elected governments in ways that appear original and distinctive to the electorate, whilst espousing the values and ideologies of the political party or parties in power.

The Economics of Ethics: The Logic of Moral Action and the Consequences for Education

Keywords: Citizenship education, Cognitive development, Developmental processes, Morality

Presenting Author:Karin Heinrichs, Otto-Friedrich-University Bamberg, Germany; **Co-Author:**Gerhard Minnameier, Goethe-Universität Frankfurt, Germany

In the context of economic experiments, giving in a "dictator game" is generally conceived as moral, while keeping the entire endowment is conceived as immoral. Similarly, in the "prisoners' dilemma", cooperation is understood as the moral course of action, defection as the immoral or selfish one. However, this interpretation misses the point for two major reasons. One concerns the rationality of moral action. The second concerns the notion of morality as such. Whereas moral philosophers and psychologists have come to see morality as a specific set of personal values, moral principles may also be understood as "institutions" in the economic sense.

Tracing the student journey through the feedback landscape

Keywords: Higher education, Learning approaches, Social aspects of learning and teaching, Student learning

Presenting Author:Rola Ajjawi, Deakin University, Australia; **Co-Author:**Margaret Bearman, Deakin University, Australia;

Co-Author:Elizabeth Molloy, Monash University, Australia; **Co-Author:**Charlotte Rees, Monash University, Australia

There has been a palpable shift in the feedback literature emphasising the role of students in feedback. Indeed, the shift suggests that information not resulting in student action is not actually feedback. Yet students tell us still that feedback is something done *to* them rather than *with* them. They are typically positioned (by self and teachers) in a passive role within feedback interactions. Synthesising recent research into students' judgements, expectations and actions in feedback interactions, we reposition the student within the feedback discourse and highlight some of the tensions that students face in navigating the feedback landscape. We do this by tracing a fictitious medical student journey through a number of networked systems described in Bronfenbrenner's ecological systems theory. Ecological systems theory posits that individuals are influenced by five interdependent (networked) environmental systems: micro-, meso-, exo-, macro- and chrono-systems (Neal & Neal, 2013). This analysis identifies the need to support students in improving their feedback literacy and helping them make sense of their experiences so that future curricula and workplace encounters build on realistic expectations and healthy feedback practices. Further, this analysis highlights the need to reframe understandings of feedback from rules about content and delivery to more nuanced appreciations of the role of relationships and context in feedback encounters.

Left to their own devices: using tablets to enhance student engagement in a flipped EFL classroom

Keywords: Educational Technology, Mixed-method research, Second language acquisition, Social aspects of learning and teaching

Presenting Author:Nicholas Bovee, Kyushu Sangyo University, Japan

AimsThis ongoing study examines how iPads might be leveraged to support student engagement and autonomy in a "flipped" English language oral communication course. Findings will be used to formulate a preliminary set of best practices in regards to tablet use in this and similar contexts.

MethodologyThe subjects were students in a compulsory course at a Japanese university in three conditions: flipped/textbook, flipped/iPad, and traditional (control condition). Engagement and autonomy support questionnaire data and objective outcomes were modeled (ANOVAs/SEM). Qualitative evidence regarding engagement was obtained from class observations and interviews.

Preliminary resultsEngagement increased greatest over the semester in the iPad condition. Engagement in the flipped and iPad conditions was higher than in the traditional condition at the end of the semester. Contrary to expectations, perceptions of autonomy support were the lowest in the iPad condition. Proficiency test scores did not differ between conditions. Completion rates for the textbook review e-learning homework was highest in the traditional condition, suggesting that higher engagement did not extend beyond the classroom. Class observations revealed that although the patterns of interactions were similar in both flipped conditions, the iPads did not seem to foster higher quality interactions.

ImplicationsThe overall similarity in engagement patterns between the iPad/flipped and textbook/flipped conditions suggests that the flipped approach itself plays a greater role in affecting engagement than the introduction of iPads. Future development of iPad-based activities should focus on minimizing their "footprint" in terms of mediating interactions so that students are communicating more directly.

Computer-based assessment of thinking skills in China: a pilot study

Keywords: Assessment methods and tools, Cognitive skills, Problem solving, Quantitative methods

Presenting Author:Hao Wu, University of Szeged, Hungary; **Co-Author:**Gyongyver Molnar, University of Szeged, Hungary

The objectives of the study is to explore the applicability of online reasoning tests for detecting the component skills of problem solving and defining background factors which impact the developmental level of student's problem solving skills in China. The sample of the pilot study was drawn from six grade students (age 11-13, N=50). The instruments of the study were conducted by four tests measuring problem solving (20 items), inductive reasoning (53 items), visual memory (12 items) and creativity (6 items), and a questionnaire, which focused on participants' demographic data, learning strategies (13 items), test-taking motivation (15 items) and ICT familiarity (9 items). The tests were carried out by means of the eDia platform. The internal consistencies of the online instruments were high, Cronbach-a varied between .74, and .90. Participants' score distribution confirmed the applicability of the test. The bivariate correlations between problem solving and both inductive reasoning ($r=.44$, p

The interplay of g and mathematical abilities in large-scale assessments across grades

Keywords: Achievement, Assessment methods and tools, Intelligence, Secondary data analysis

Presenting Author:Nele Nicole Kampa, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Steffani Sass, Leibniz Institute for Science Education and Mathematic, Germany

The study investigates the interplay of general cognitive abilities and domain-specific mathematical ability applying three different models that represent g , math-ability and Gf as well as math-specific ability and g . Furthermore, we analyze the relation between the student characteristics like self-concept in mathematics, gender, SES, and grade in mathematics. Using data from six different German LSAs of the three cohorts Grade 5, 9 and 13 (sample sizes range from $N_{Grade5} = 730$ to $N_{Grade9} = 3,893$) and two different frameworks (i.e., literacy and curricular) the data confirmed that LSAs do test math ability beyond g . The two cognitive factors correlated differently with the considered student characteristics which calls for future longitudinal approaches to the issue.

Deeper learning and Assessment in 7th graders reading comprehension processes

Keywords: Assessment methods and tools, Cognitive skills, Comprehension of text and graphics, Self-regulation

Presenting Author:Wenke Mork Rogne, Volda University College, Norway; **Co-Author:**Siv M. Gamlem, Volda University College, Norway

The aim of this study is to investigate 7th graders' ($N=30$) text processing in reading multiple, partly contradictory texts. Further, we investigate to what extent pupils seek internal feedback and process information from such texts. In the current project we adopt a comprehensive definition of the concept "Deeper learning" as it is explained as heuristics by Wineburg (1991). Moreover, pupils with prior high scores on standardized reading tests elaborated and evaluated more, and paraphrased less, on contradicting information than pupils with low prior reading scores. These pupils seem to seek internal feedback on a task, process and self-regulation level, while the pupils with low prior reading scores were seeking feedback related to a task- and self-level. This illustrates how reading strategies may vary across individuals with respect to both reading skills and ability to detect contradictory information when pupils work with multiple conflicting documents. While the less-skilled readers ignored the contradictory information, the skilled readers showed a strong will to resolve the dissonance and struggled to clarify through using deeper strategies and questions during reading. Results demonstrate that less-skilled readers need more support during problem solving tasks.

Assessment for learning in Higher Education: Potential and constraints from the students' view

Keywords: Assessment methods and tools, Higher education, Learning approaches, Self-regulation

Presenting Author:Diana Pereira, University of Minho, Portugal; **Co-Author:**Patrícia Santos, Institute of Education - University of Minho, Portugal; **Co-Author:**Maria A. Flores, University of Minho, Portugal

Pedagogical innovation is a key issue in Higher Education (HE), in a context where the educational priorities point out to the need to strengthen the teaching quality levels. With the Bologna Process, the renewed framework in the curricula has brought about changes with implications for teaching, learning and assessment methodologies, considered key issues to achieve pedagogical excellence in HE. Since it emphasises assessment and continuous feedback mechanisms between teacher and student for adjustment of teaching strategies and learning activities, the Assessment for Learning (AfL) approach has been pointed out as a pedagogical innovation where the priority is to enhance students' learning. Literature highlights that AfL practices stimulate students' engagement in the learning process in a more active way, providing them with more positive formative experiences. This paper draws on data from an ongoing PhD project aimed at investigating AfL in Sciences, Engineering and Social Sciences in two public universities in Portugal. With three different research phases, the study combines the development of focus groups, a survey and the development of an intervention project with students. Data reported in this paper were collected through the development of the intervention project focused on AfL, namely with the development of a survey and the monitoring strategies of teaching, learning and assessment. In total, 70 students enrolled at an Engineering programme participated in this phase. Findings reflect about AfL potentialities and implications in the teaching, learning and assessment processes, as well as in the academic outcomes in HE.

Epistemic beliefs as predictors of epistemic emotions: Extending a theoretical model

Keywords: Attitudes and beliefs, Emotion and affect, Experimental studies, Synergies between learning - teaching and research

Presenting Author:Tom Rosman, Leibniz Institute for Psychology Information, Germany; **Co-Author:**Anne-Kathrin Mayer, ZPID - Leibniz Institute for Psychology Information, Germany; **Co-Author:**Günter Krampen, ZPID - Leibniz Institute for Psychology Information, Germany

We analyze the effects of psychology students' epistemic beliefs on their emotions when confronted with controversial learning materials (e.g., multiple texts containing contradictory views on a topic). According to the cognitive incongruity model by Muis, Pekrun, Sinatra, Azevedo, Trevors, Meier, and Heddy (2015), cognitive incongruity arises if students' epistemic beliefs are incompatible with the epistemic nature of a learning task. This, in turn, has negative effects on their epistemic emotions. Since the epistemic nature of controversial learning materials might be perceived very differently depending on whether individuals integrate (i.e., resolve) the controversies (e.g., by identifying moderator variables) or not, we propose to extend the cognitive incongruity model by including students' individual approach towards the learning materials (i.e., integrative vs. not integrative) as an additional model component. In line with our theorizing, we expected students with more advanced epistemic beliefs to experience less negative and more positive epistemic emotions when confronted with scientific controversies – but only if they integrate the conflicting claims. To test these predictions, we instructed one third of our sample to integrate the information contained in 18 text snippets on gender stereotyping that were specifically designed to allow for such integrations (so-called resolvable controversies). Two control groups were given the same text snippets, but were not required to integrate the controversies. Results revealed that absolute beliefs positively and evaluativistic beliefs negatively predict negative emotions in the experimental group, but not in the control groups, thus supporting our hypothesis concerning the extension of the cognitive incongruity model.

Toward success or away from failure: Factors that predict regulatory focus and academic goal pursuit

Keywords: Goal orientation, Motivation, Parental involvement in learning, Teaching approaches

Presenting Author:Fiona Cooligan, University of Ottawa, Canada; **Co-Author:**Kaitlyn Werner, Carleton University, Canada; **Co-Author:**Rebecca Klimo, Carleton University, Canada; **Co-Author:**Marina Milyavskaya, Carleton University, Canada

The purpose of the present study was to examine the factors associated with the development of a promotion versus prevention regulatory focus, which in turn influence the motivation for academic goals. As part of a larger study, participants identified three personal goals and indicated their reasons for pursuing them. For the purposes of the present research, however, all goals were coded and the first academic goal indicated for each participant was used. We also measured participants' regulatory focus and their perception of autonomy support from their parents and favourite professor. We examined whether both parenting and teaching style (i.e., autonomy supportive versus psychologically controlling) is associated with a promotion or prevention orientation and, in turn, whether such orientations influence motivation for academic goals. Preliminary results indicate that autonomy support from parents was significantly associated with students exhibiting a promotion orientation, while autonomy support from favourite professor was only marginal. Neither autonomy support from parents or professor was associated with a prevention-orientation. Further analyses investigate whether promotion and prevention orientations differentially predict motivation for pursuing academic goals (i.e., autonomous, controlled, approach and avoidance motivation). Discussion will focus on potential limitations in terms of professor autonomy support and how both parents and teachers can influence the way students frame their experience during academic goal pursuit.

Shifting attitudes on GMF's: The influence of a conceptual change intervention

Keywords: Attitudes and beliefs, Conceptual change, Emotion and affect, Misconceptions

Presenting Author:Ian Thacker, University of Southern California, United States; **Co-Author:**Krista Muis, McGill University, Canada; **Co-Author:**Gale Sinatra, University of Southern California, United States; **Co-Author:**Robert Danielson, University of Southern California, United States; **Co-Author:**Reinhard Pekrun, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Philip Winne, Simon Fraser University, Canada; **Co-Author:**Marianne Chevrier, McGill University, Canada

We assessed the effects of reading multiple refutation texts about genetically modified foods (GMFs) on participants' misconceptions and attitudes. University students (N=217) drawn from two North American universities first read a refutation text on GMFs and were then randomly assigned to receive additional information about advantages of GMFs, disadvantages of GMFs, or both. Results revealed that students reading about the advantages of GMFs had significantly better attitudes than students that read about the disadvantages. Results also suggest that emotions significantly predicted changes in attitudes. There were also significant knowledge gains overall. Theoretical and practical implications are discussed including the impact these findings may have on science education.

How Perceived Emotions of Classmates Affect Students' Emotions

Keywords: Attitudes and beliefs, Emotion and affect, Social interaction, Motivation and emotion

Presenting Author:Philipp Forster, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Kaiqi Shao, University of Munich (LMU), Germany; **Co-Author:**Reinhard Pekrun, Ludwig-Maximilians-Universität (LMU), Germany

The emotional environment in the classroom setting has been identified as important to students' experience of emotions

(Pekrun, 2006). However, research on the role of student's perceptions of other students' emotions for their own experienced emotions is largely lacking. To redress this research deficit, we investigated $N = 104$ Chinese middle school students. Correlative analyses revealed that students' perceptions of their classmates' enjoyment, anxiety, and boredom are positively related to their own experience of these emotions. Mediation analyses showed that the link between students' perceived and experienced enjoyment is mediated by their appraisals of control and value. Overall, our findings support the importance of students' perception of others' emotions for their own emotional lives.

Viewpoints to tablet computers, learning and motivation –how are they related?

Keywords: Collaborative Learning, Primary education, Secondary education, Motivation and emotion

Presenting Author: Laura Hirsto, University of Eastern Finland, Finland; **Co-Author:** Timo Tossavainen, University of Eastern Finland, Finland

In this paper the experiences of using and utilising tablets for learning among students of two different types of combined elementary and secondary schools in Finland. Earlier research had shown contradictory results on the effects of the use of tablets and iPads in education for learning and motivational themes. Thus, it is evident that we need more research to find out and understand the potential of tablets for learning (e.g. Underwood & Farrington-Flint, 2015). The aim of this paper is to investigate primary and secondary education students' experiences of learning in two different kind of tablet school contexts. The first school has had few years of experience of using one-to-one tablets in all subject areas frequently, and the other has used school-based tablets more seldom. According to preliminary results, pupils experiences in there different contexts varied. Of course, the better availability of the tablet facilitated more varying pedagogical use of them. However, there seemed to be also different kinds of general pedagogical practices in these two contexts. Pupils in the one-to-one tablet school more often reported practices that facilitated self-regulated learning and collaborative knowledge building. The results will be discussed in the light of earlier studies and theoretical viewpoints to motivation.

Exploring teacher-student boundaries through ethical dilemmas in the secondary school context

Keywords: Educational policy, Morality, Pre-service teacher education, Teacher Professional Development

Presenting Author: Zoe Morris, Monash University, Australia

Teachers face frequent ethical dilemmas in their daily work (Shapira-Lishchinsky, 2011), and require adequate skills in ethical reasoning (Strike & Solitis, 2009). 227 early career secondary teachers in Australia who had up to five years' teaching experience responded to five vignettes presented within a survey as part of a larger study. Each vignette outlined a brief situational context in which ethical boundaries of a teacher may be compromised. The interaction domains depicted in the vignettes were: physical support, connectivity, emotional support, instrumental support. Three themes emerged in the responses across all vignettes: proposed action, contextual considerations, and protective behaviour. Higher order themes and their relationships are examined within the ethical policy context of teachers.

The impact of project-based learning in a KAMISHIBAI class: developing students' 21st-century skills

Keywords: Cognitive skills, Higher education, Learning approaches, Problem-based learning

Presenting Author: Naomi Tomioka, Shikoku University, Junior College, Japan; **Co-Author:** Naohiro Minagawa, Naruto University of Education, Japan

This study aims to evaluate the impact of project-based learning (PBL) in a KAMISHIBAI (Japanese traditional paper theatre) class. The author hypothesized that participating in and performing KAMISHIBAI together with a teammate would improve students' 21st-century skills. Accordingly, PBL classes were planned. The participants included six undergraduates and six graduate students at two Japanese universities. After the classes, descriptive data about students' perceived improvements was collected and analysed via a content analysis using a text-mining method. The results show that students believed that they improved in five out of 10 skills: "Critical thinking, problem solving, decision making" in the "Ways of Thinking" category; "Communication" and "Collaboration (teamwork)" in the "Ways of Working" category; and "Citizenship" and "Personal and social responsibility" in the "Ways of Living in the World" category. The results also

indicate that the two broad categories of 21st-century skills were improved through PBL in the KAMISHIBAI class. There are, however, two limitations of this study: (1) the difficulty of evaluating metacognition in the present analysis and (2) the difficulty of improving participants' ways of thinking.

Gender differences on technology-enhanced feedback for pupils in general and special education

Keywords: Educational Technology, Primary education, Social interaction, Special education

Presenting Author:Sanna Oinas, University of Helsinki, Finland; **Co-Author:**Risto Hotulainen, University of Helsinki, Finland; **Co-Author:**Mari-Pauliina Vainikainen, University of Helsinki, Finland

Technology-based platforms enable new methods for parent-teacher collaboration. Parents can be informed for example via school web-pages and e-mails (Thompson, Mazer & Grady, 2015). Teachers can also provide technology-enhanced feedback direct to pupils and parents (Tanes, Arnold, King & Remnet, 2011). In the Core Curriculum (National Board of Education 2014), information technology is explicitly named as a tool for collaboration with parents, and over 90% percent of the Finnish municipalities use these platforms for sending feedback to parents about their child's performance and behaviour. The impact of feedback has been studied from different perspectives, for example focussing on performance (Hattie & Timperlay, 2007), learning orientations (Pekrun, Cusack, Myrayama, Elliot & Thomas, 2014), and school engagement (Tennant, Demaray, Malecki, Terry, Clary & Elzinga, 2015). The results have been controversial: they indicate that feedback can be either beneficial or harmful, depending on how it is given and how it focusses on (Dweck & Master, 2009). However, supportive feedback for pupils with special needs is essential (NBE, 2014; Tennant et al., 2015). The results of the two studies are presented in a poster. The data consisted on 211 003 separate feedback actions delivered through technology-enhanced platform for 7811 pupils, in a school-year 2014-2015. The results show that feedback is delivered unequally to pupils, and boys and girls receive feedback differently. There is also shown that pupils in special education, specially boys, got more negative feedback than others. Results are important for preventing negative feedback loops in education.

Implementation effects in the training of phonological awareness in kindergarten children

Keywords: Early childhood education, Language (L1/Standard Language), Quasi-experimental research, Teacher Effectiveness

Presenting Author:Catharina Tibken, University of Würzburg, Germany; **Co-Author:**Sebastian Kempert, University of Potsdam, Germany; **Co-Author:**Regina Götz, University of Wuerzburg, Germany; **Co-Author:**Kristine Blatter, Deutsches Jugendinstitut, Germany; **Co-Author:**Wolfgang Schneider, University of Würzburg, Germany

In previous studies, phonological awareness proved as an important precursor for the acquisition of written language. According to recent meta-analyses, phonological training programs foster the development of phonological awareness in kindergarteners. On average, moderate effect sizes of the training have been reported. Although current meta-analyses show the general benefit related to phonological training, they indicate that training implementation significantly influences the program's effectiveness. Up to now, there is a lack of studies, which investigate the role of moderating factors. In our study, we addressed this question with regard to a set of organizational and personal factors. We examined 390 kindergarten children in Germany. During the last year of kindergarten, we administered a set of phonological tests at two measurement points. In between, the kindergarten teachers conducted a well-established phonological training to foster the children's phonological awareness. Additionally, the kindergarten teachers recorded procedural details and took part in an interview about the general conditions of the training. Results show that the phonological training improved children's phonological awareness. Further, especially personal factors such as a greater experience of the kindergarten teachers with the training program substantially enhance its benefit. In contrast, organizational factors such as group size seemed to play a subordinated role. Consequently, paying attention to specific quality criteria in the training implementation improves the training's success and should be considered in future. To use limited resources in the most efficient way, it is crucial to know, which moderating factors play the most important role in educational processes.

Transfer of knowledge: A modality, knowledge, and conceptual analysis

Keywords: Educational Psychology, Instructional design, Learning approaches, Synergies between learning - teaching and research

Presenting Author:Bobby Hoffman, University of Central Florida, United States; **Co-Author:**Morgan McAfee, University of Central Florida, United States

A goal of successful scholarship is using evidence-based practices to inform teaching excellence. As such, this mixed-method study examined transfer of knowledge amassed during the completion of a three-year Masters-level program in Educational Psychology. Quantitative methods determined if superior knowledge transfer was related to course modality, domain of interest, and/or knowledge type. A qualitative scoring matrix and content analysis were used to provide examples of innovative knowledge transfer and application. Results revealed greater knowledge transfer for blended-learning students compared to those who predominantly completed distance education and significantly greater transfer for declarative and procedural knowledge related to learning and motivation in comparison to life-span development. We advanced strategies and design recommendations to promote authentic knowledge transfer in graduate-level educational psychology programs.

When the apprentice surpasses the master: teacher content knowledge relative to their students

Keywords: Educational policy, Literacy, Primary education, Teaching approaches

Presenting Author:Nives Nibali, University of Melbourne, Australia; **Co-Author:**Susan-Marie Harding, The University of Melbourne, Australia; **Co-Author:**Patrick Griffin, The University of Melbourne, Australia; **Co-Author:**Lorraine Graham, The University of Melbourne, Australia

Research into levels of teacher knowledge in literacy and more specifically reading is largely confined to ranking teachers and comparing student achievement between classes of teachers whose content knowledge differs. A review of the literature failed to find studies that compared teacher performance levels with those of their students. Comparing teacher performance levels to that of their students would reveal if there are students for which the teacher has a lower level of content knowledge and may consequently lack the content knowledge required to support growth in students of relatively higher ability. This study, compared teacher content knowledge with student content knowledge. A total of 23 Year 5/6 teachers and their students completed an online reading comprehension assessment to determine their reading ability. Of the 23 classes that participated, 61 percent of classes contained students who performed at a higher level than their teacher. Given that the study was conducted at the primary level, this finding is particularly poignant as it challenges the widely accepted assumption that Year 5/6 teachers are more proficient in reading than their students.

Assessing and improving quality science instruction using an innovative tablet portfolio app.

Keywords: Assessment methods and tools, Science education, Teacher Effectiveness, Teacher Professional Development

Presenting Author:Jose Felipe Martinez, University of California, Los Angeles, United States; **Co-Author:**Matthew Kloser, University of Notre Dame, France; **Co-Author:**Brian Stecher, The RAND Corporation, United States; **Co-Author:**Matt Wilsey, University of Notre Dame, United States; **Co-Author:**Jayashri Srinivasan, University of California, Los Angeles, United States; **Co-Author:**Amanda Edelman, Pardee RAND Graduate School, United States

Teaching portfolios have long been used in a dual role to monitor and assess instructional practices, and support teachers in professional reflection and learning. Quality of instruction and professional self-reflection among practicing science teachers is currently a topic of great interest in the United States as the country moves to adopt the Next Generation Science Standards (NGSS). We developed an innovative electronic portfolio tool implemented in tablet computers which enables science teachers to compile and review multimedia evidence of instructional practices aligned to the NGSS (documents, pictures, and video). We report the results of a pilot study with nearly 40 middle school science teachers who used the e-portfolio to collect evidence of instruction in their classrooms. Our study investigates two related questions: first the reliability and validity of ratings of quality science instruction based on the evidence compiled in the portfolios, and second the value of the portfolio tool for teacher professional development. Qualitative analysis of interviews with all participant teachers suggest the tool offers an effective platform for professional self-reflection and growth. The paper will additionally present psychometric analysis of the portfolio rating part of the study currently under way. We discuss the implications of these results for understanding how portfolio tools may support systems looking to monitor and improve the quality of classroom practices, and teachers seeking a platform for reflecting about and improving their own instructional practices.

Implementation of instructional change and its effect on students' achievement.

Keywords: Achievement, Quasi-experimental research, School effectiveness, Teacher Professional Development

Presenting Author:Sébastien Dellisse, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Benoît Galand, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Xavier Dumay, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Liesje Coertjens, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Vincent Dupriez, Université catholique de Louvain (UCL), Belgium

Large-scale instructional change is a substantial challenge. Due to a lack of implementation, many reforms fail in their effort to both change teaching practices and improve student achievement. Focusing on the implementation process, Rowan and Miller (2007) have shown that a procedural or a professional model have a significant effect on instructional change and learning improvement. Other researchers have highlighted that motivational aspects, more precisely self-efficacy and task-value, and organizational capacity, like collaboration and the support of the educative team, could also have a significant effect on the implementation of alternative teaching practices. Our research investigates three hypotheses: procedural and professional control, in comparison with the control group, promotes instructional change (1), professional control promotes a higher level of implementation than procedural control (2), and, the implementation of new practices fosters achievement gains in students' reading and writing (3). To answer these questions, we conducted an experimental study in 19 Belgian secondary schools. Schools were randomly assigned to either the control group or to experimental conditions which have received an educational program on reading and writing strategies, a training to its use and/or a coaching during the school year. Data were collected through validated questionnaires completed by teachers and their students. Preliminary analyses indicate that, compared to the control group, classes pertaining to the experimental conditions show a stronger increase in students' achievement. It also seems that the value given by teachers to some program components and collaboration around program activities are positively related to the implementation.

Effects of usability and organization on students' learning from instructional hypertext

Keywords: Educational Technology, Learning Technologies, Reading comprehension, Multimedia learning

Presenting Author:Álvaro Jáñez, University of Salamanca, Spain; **Co-Author:**Javier Rosales, University of Salamanca, Spain; **Co-Author:**Jean-François Rouet, University of Poitiers, France

Hypertext structure and usability have been identified as key variables associated to navigation and comprehension performance in hypertext. However, there is currently very little data on the potential interactions of both variables. In the present study, twenty-four undergraduate students were recorded while navigating two hypertexts (one structured hierarchically, the other one structured as a network). The participants were assessed for comprehension afterwards. Another twenty-four students were recorded navigating the same two hypertexts, but with a lower usability design. Results showed an interaction between hypertext structure and usability on comprehension scores. Also, navigation recordings showed how participants navigated differently across hypertext structures. Differences in comprehension are analysed through navigation differences, trying to explain how both variables interact.

Supportive hints in a digital environment foster students' motivation to read informational text

Keywords: Computer-assisted learning, Motivation, Reading comprehension, Self-regulation

Presenting Author:Marlies ter Beek, University of Groningen, Netherlands; **Co-Author:**Leonie Brummer, University of Groningen, Netherlands; **Co-Author:**Anouk Donker-Bergstra, Rijksuniversiteit Groningen, Dept of Education and GION, Netherlands; **Co-Author:**Marie-Christine Opendakker, University of Groningen, Netherlands

Students' motivation to learn increases when they can autonomously decide what to do or when they can regulate their own need for help (e.g., self-regulated learning; Zimmerman, 2008). Self-regulated learning nowadays can be digitally facilitated, but although technological applications are believed to increase student motivation, little empirical research exists regarding the possible influence of digital support on reading motivation (Moran et al., 2008). This research project investigated whether self-regulated use of supportive cognitive and metacognitive scaffolds in a digital learning environment increases students' motivation to read informational texts. Three different groups of 7th-graders work in our digital reading environment to read geographical and historical materials. By using three different conditions we can determine whether providing supportive hints influences student motivation to read regardless of the subject of the text. Preliminary results based on a usability questionnaire show that students enjoyed working in our digital environment, but statistical data analysis after semester 1 (December 2016) will reveal whether providing hints significantly influences student reading motivation.

Effects of Scaffolding Programs on Meta-Cognitive Skills Within Computerized Science Problem Solving

Keywords: Computer-assisted learning, Metacognition, Problem solving, Science education

Presenting Author:Zvia Fund, Bar-Ilan University, Israel

The current paper examines the effect of scaffolding programs on *meta-cognitive skills* in a computerized environment. This environment presents simulations of scientific laboratory experiments followed by qualitative problems that the students are required to solve. Four scaffolding components were identified - structure, reflection, subject-matter and enrichment, and used in different configurations to construct four support programs (based on human teaching), implemented by appropriate worksheets. The scaffolded groups were compared to one another and to a non-scaffolded control group as regards increasing effectiveness of three meta-cognitive skills: self-assessment problem solving process; assessing final answer; finding the error and its causes for incorrect solution. Participants were 187 junior high school students, in five experimental groups, each of three academic levels. All groups worked within the same computerized learning environment. The treatments were conducted once in every two weeks for a period of approximately 6 months. The students were interviewed at the end of the study, and their problem solving activities in the computerized learning environment were observed and transcribed. The resulted protocols were then analyzed, each student being assigned an effectiveness score for each meta-cognitive skill. These scores were subjected to a 5x3 (groups by academic levels) ANOVA analysis. Results showed highly significant differences between the groups in all three skills, and different patterns of effectiveness, depending on treatment and academic level. Further contrast analyses showed strong effect of "structure + reflection" combination, and weak or even negative effect of subject-matter, both are explained and elaborated upon in the paper.

Learning from scientific texts through constructing video-based explanations

Keywords: Learning Technologies, Science education, Student learning, Multimedia learning

Presenting Author:Stephanie Wassenburg, Erasmus University Rotterdam, Netherlands; **Co-Author:**Björn de Koning, Erasmus University Rotterdam, Netherlands; **Co-Author:**Fred Paas, Erasmus University Rotterdam/University of

Wollongong, Netherlands

Video-based explanations are an increasingly popular educational method. As many studies have already indicated the advantages of learning from these videos, the present study focuses on the effects of creating video explanations on learning and transfer. It has been shown that creating a video-based explanation of a text encourages the messenger to actively engage in learning strategies. The present study investigates what it is about explaining aloud during video creation that helps participants learn. For example, recording a video allows you to imagine a non-present audience (i.e., other students versus future self). Presumably, the imagined audience influences what strategies are used. Furthermore, the multimodal nature of a video enables the speaker to gesticulate while explaining, which may decrease cognitive load. In the present study, undergraduate students create a video explanation after reading a science text. Students are either instructed to explain the text to oneself or to non-present students, whereas a control group reads the text out loud while recording. To study the influence of gesture, half of the participants are restrained from using gestures, whereas gesticulating is encouraged for the others. All participants are tested on comprehension and knowledge transfer immediately after constructing the video. Besides a main effect of gestures, we expect students in both explaining groups to outperform the control group. Furthermore, the non-present audience may influence self-efficacy and reported mental effort. Results are expected before the spring of 2017 and will be of relevance for educational practice.

The effect of computer game usage on absenteeism mediated by students' cognitive lesson avoidance

Keywords: Cognitive skills, Educational Technology, Quantitative methods, Technology

Presenting Author:Arvid Nagel, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Horst Biedermann, University of Teacher Education St.Gallen, Switzerland

In the past the phenomenon of lesson avoidance and school absenteeism of students has aroused an increasing interest both in science and in media. Nevertheless, research has failed to keep up with these developments in offering theoretical and empirical evidence for understanding students' lesson avoidance yet. This study aims to predict cognitive and physical lesson avoidance of students by (problematic) computer game usage. In this regard we pose the question whether we can identify effects of computer game use on cognitive and physical lessons avoidance behavior of students? The study was conducted based on a German student sample from grades 7 to 10 (N=578). Whereas research on school absenteeism generally describes students failing to attend schools or their lessons, we take a broader perspective and – beyond physical lesson avoidance – also address cognitive lesson avoidance of students. So far, no appropriate quantitative instruments are available to assess students' cognitive lesson avoidance. Therefore, we developed a new four-item scale. The psychometric properties of the EFA and CFA support the theoretically postulated one-factorial structure of cognitive lesson avoidance. Further we are able to show a mediation of computer game usage on physical lesson avoidance via cognitive lesson avoidance utilizing structural equation modeling.

How Tablets Can Improve Learning in Schools - An Explorative Study

Keywords: Computer-assisted learning, Educational Technology, Primary education, Qualitative methods

Presenting Author:Steffi Zander, Bauhaus-Universität Weimar, Germany; **Co-Author:**Anne Behrens, Bauhaus-Universität Weimar, Germany

This contribution reports the results of a project that aimed in implementing tablets into a primary school and to examine perceived advantages and drawbacks of tablet use by teachers and students. The faculty was qualified to create own lessons of high media didactic quality in order to implement them afterwards in their own classes. In the project's empirical part, the possibilities were examined how tablet computers may support and increase the lessons' quality. The resulting insight was connected to existing theoretical and empirical evidence. Further, core categories for a sensible high-quality tablet-assisted curriculum were developed. The results show that the students and teachers seem to be very excited to learn and teach with the tablet computers, also they are reflecting the frequency of usage on high standard. These findings are intensified in a subsequent study in secondary schools and continue to be reviewed.

Does a differentiated instruction increase or decrease interactions between students?

Keywords: Peer interaction, Primary education, Special education, Teaching / instruction

Presenting Author:Stefanie Bosse, University of Potsdam, Germany; **Co-Author:**Thorsten Henke, University of Potsdam, Germany; **Co-Author:**Katja Bogda, University of Potsdam, Germany; **Co-Author:**Nadine Spörer, University of Potsdam, Germany

In inclusive classes the range of students' individual abilities is higher than in regular classes. Therefore, teachers are challenged to provide appropriate levels of instruction by, for example, using differentiated instruction. It is assumed that differentiated instruction influences the interactions in the classroom (Klieme & Warwas, 2011). However, empirical evidence of this assumption is still rare. The goal of our study was to analyse if there was a positive relation between differentiation in inclusive primary school lessons and the number of on-task student-student-interactions. Participants of the study were $N = 213$ students drawn from ten German primary schools. Data were collected at three measurement points within a time period of two school years. To answer the research question, students' math and German lessons were observed 10 times at each measurement point by trained external observers. The observations were conducted with the help of a software. The results of our initial analyses were in line with our assumption. For the first two measurement points we found positive correlations between the amount of differentiation and the amount of on-task student-student-interactions. The more a teacher used differentiation during a lesson, the more a student interacted with another student. In the next analysis steps, we will focus on differences between math and German lessons. Furthermore, the relation between the learning context and the student-student-interactions will be analysed.

Effect of disability cognitive bias modification task on attitudes towards people with a disability

Keywords: Attitudes and beliefs, Experimental studies, Misconceptions, Social interaction

Presenting Author:Vanja Van Aarsen, KU Leuven, Belgium; **Co-Author:**Katja Petry, K.U.Leuven, Belgium

In the past decades, there is a trend of including people with a disability into society. Despite this trend, people with a disability are viewed as differing from the norm and are discriminated against. It is often assumed that full inclusion of these people is hindered by negative attitudes about them held by the general population. According to the dual-attitude model, these attitudes can be explicit or implicit. Research has shown that implicit attitudes are a better predictor of behaviour when it concerns socially sensitive topics. Thus, improving the implicit attitudes of people towards people with a disability can enhance the chance of successful inclusion of people with a disability. For example, improving the attitudes of teachers towards students with a disability can enhance the chance of successful inclusion into the school community of these students. In this paper we developed an intervention aimed at changing attitudes towards people with a disability. We developed a cognitive bias modification task that targets the interpretation bias about people with a disability in everyday live situations. Our experiment was successful, as we found that our participants had more positive interpretations afterwards than they had at the start. However, we did not find an effect on our implicit or explicit attitude measures.

Development and validation of a social network analysis instrument to promote inclusive education

Keywords: Assessment methods and tools, Collaborative Learning, Social interaction, Special education

Presenting Author:Jasmien Sannen, KU Leuven, Belgium; **Co-Author:**Katja Petry, KU Leuven (BE), Belgium; **Co-Author:**Nick Ferbuyt, University of Antwerp, Belgium

A pivotal factor in realizing inclusive learning environments (ILO) is collaboration. One cannot expect that a single teacher, working alone, has all the knowledge and expertise to meet the diverse needs of all learners. The social network theory (SNT) and its corresponding methodology, social network analysis (SNA), provides an excellent framework to study collaboration and to gain insight into the exchange of knowledge and expertise through social relationships. To our knowledge, there is no research that has focused on the use of a social network approach on studying collaboration in order to create ILO. Therefore, this study focuses on the development and validation of a SNA-instrument that provides teachers, schoolteams and researchers insight in the social networks with regard to the creation of ILO. We will apply a whole network approach to create a picture of the network of the whole schoolteam and their external partners. Each of them will indicate who they ask for support and who they give support in the light of creating ILO. Accessible and inviting visualisations of social networks will be provided to support teachers and teams to better understand and strengthen their networks. To validate the SNA-instrument the *Standards for Educational and Psychological Testing* will be used. By developing and validating an innovative SNA-instrument in the context of inclusive education, which can be used both for research and for practical purposes, this study is of great theoretical, methodological and practical importance.

How to design educational material for inclusive classes

Keywords: Instructional design, Learning disabilities, Mathematics, Mixed-method research

Presenting Author:Anna Noll, University of Koblenz-Landau, Germany; **Co-Author:**Jürgen Roth, University of Koblenz-Landau, Germany; **Co-Author:**Markus Scholz, Pädagogische Hochschule Ludwigsburg, Germany

Although pupils with disabilities are broadly integrated into mainstream schools, only few empirically based findings about inclusive lessons can be found. For example, little research has been conducted on how educational material used in inclusive classes should be designed. Furthermore, the few available studies are contradictory. This project investigates which design elements of work assignments positively influence the performance of students in inclusive classes. Within the framework of an empirical study, we will analyze whether the use of the easy-to-read guidelines or enriching text with symbols facilitates pupils' comprehension. Students with and without learning disabilities participate in the study. With regard to content, the pre-study and the main study focus on introducing fractions. These are taught in activity-oriented

manner with hands-on material. A qualitative preliminary study focuses on the benefits of using easy-to-read language as well as on the advantages of linking text and symbols by use of eye tracking, interviews and thinking-aloud-protocols. An adequate register, an appropriate use of symbols and convenient exercises shall thus be identified. For the main study, a pre-post-test design comprises two experimental and one control group. Before and after the conduction of the exercises, the pupils' knowledge about fractions is determined by a test. Experimental group one works with a linguistically and pictorially simplified version of the tasks as the easy-to-read guidelines are applied and symbols are added to the text. The tasks of the second experimental group are linguistically simplified only. The control group receives a not simplified version of the tasks.

Italian preschool teacher's opinion about their inclusive practices

Keywords: Early childhood education, Mixed-method research, Special education, Teacher Professional Development
Presenting Author: Lucia Scipione, University of Modena and Reggio Emilia, Italy; **Co-Author:** Maja Antonietti, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy; **Co-Author:** Chiara Bertolini, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy; **Co-Author:** Alice Veneziani, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy

Italian school regulation state full inclusion for all children with SEN in regular schools since 1982. The Italian discussion about the model of inclusion in the last years seems not to recognize the specificity of different school settings, like preschool, referring to a general theoretical framework. According to the literature and inclusion evaluation scale (ERVIS, INDEX, QUADIS), the research construct a questionnaire with closed and open questions focused on crucial issues about inclusion. This research investigates preschool context, analysing 68 preschool teachers opinion about their inclusive practices. The aim is to collect, describe, analyse inclusive practices in preschool, comparing them with general school inclusion model and previous research.

Teachers beliefs about inclusion: self-efficacy and attitudes

Keywords: Attitudes and beliefs, Self-efficacy, Special education, Teacher Professional Development
Presenting Author: Saskia Opalinski, University of Education Freiburg, Germany

For ensuring an inclusive school system, demanded by the UN Convention on the Rights of Persons with Disabilities, teachers' attitudes and knowledge, as two aspects of teacher professionalism, need to be considered as key factors. While national and international research findings are broadly inconclusive or even contradictory, a positive correlation between teacher self-efficacy and attitudes towards inclusion in schools was shown (Savolainen et al., 2012). For Germany recent research on these two aspects and comparative research with a leading country in matters of students' performance, equal opportunities and inclusion like Finland is missing. In this study research questions concerned (a) Thuringian teachers' self-efficacy, their attitudes towards inclusion and (b) the relation of these two concepts (c) compared to those of Finnish teachers. In 2010/2011 teachers from Finland (N=112) and Thuringia (N=362) were surveyed using online questionnaires. Previous analyses show, that while the Finnish teachers show definite positive attitudes towards inclusion, Thuringian teachers present quite negative and critical attitudes. Both groups ascribe a similarly neutral to positive professional self-efficacy to themselves. A significantly higher correlation between teacher self-efficacy and attitudes towards inclusion was found for the Thuringian teachers. Further analyses were done to examine potential explanations of these differences. Therefore, results of cluster analysis will be reported. At the end, based on the results, aspects of modified basic and advanced education of German teachers are addressed.

Literacy Development Trajectories in Children at FR of Dyslexia: The Role of Early Oral Language

Keywords: Language (L1/Standard Language), Learning disabilities, Literacy, Primary education

Presenting Author: Marjolein Zee, University of Amsterdam, Netherlands; **Co-Author:** Sietske van Viersen, University of Amsterdam, Netherlands; **Co-Author:** Elise de Bree, University of Amsterdam, Netherlands; **Co-Author:** Aryan van der Leij, University of Amsterdam, Netherlands; **Co-Author:** Ben Maassen, University of Groningen, Netherlands; **Co-Author:** Peter de Jong, University of Amsterdam, Netherlands

The present study investigated the influence of early oral language on two pathways towards reading comprehension in

children with and without a family risk (FR) of dyslexia. The sample included 237 children (164 at FR) from the Dutch Dyslexia Program (DDP). Longitudinal data covered seven occasions during development between 4 and 12 years. The effect of early oral language on reading comprehension was mediated by preliteracy skills and word decoding ability for the first pathway and by later language abilities for the second pathway. FR was found to have an independent effect on general learning ability, preliteracy skills and word decoding abilities, but not on the language pathway. FR was also found to have a direct influence on reading comprehension. Findings indicated that early oral language has a small effect on early literacy development, but effects are hard to trace on the long run.

Specific and general orthographic knowledge predicts reading and spelling skills

Keywords: Educational Psychology, Learning and developmental difficulties, Literacy, Primary education

Presenting Author:Telse Nagler, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany; **Co-Author:**Jelena Zaric, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany

The role of orthographic processing for literacy development has become a focus of interest in recent years as empirical data suggest that orthographic knowledge can predict reading and spelling performance. Orthographic knowledge is considered to be a multi-dimensional construct with two subcomponents, the word-specific (sensitivity to the correct spelling of a specific word) and general (sensitivity to legitimate letter patterns) orthographic knowledge. The predictive value of orthographic knowledge, however, is not yet sufficiently verified and it remains unclear to which extent both subcomponents explain different amounts of unique variance. It is, hence, the aim of the present study to investigate the predictive value of word-specific and general orthographic knowledge more closely. Reading and spelling performance from 94 German elementary school children was assessed via standardized achievement tests. Furthermore, an orthographic choice task measuring word-specific orthographic knowledge and two nonword forced choice tasks measuring general orthographic knowledge, with regard to the sensitivity of frequency and legit position of letter patterns, were conducted. Results indicate that the orthographic choice task as well as one of the nonword forced choice tasks (with regard to the legitimacy of letter pattern position) significantly correlated with and significantly predicted reading and spelling performance. Squared semi-partial correlation analysis further indicated that word-specific orthographic knowledge and general orthographic knowledge of legit letter patterns explained more unique variance for spelling than for reading. Hence, information about word-specific and general orthographic knowledge could be used for early identification of children at risk for reading and especially spelling difficulties.

Improving executive functions in pupils with specific learning disabilities (dyslexia, dysgraphia)

Keywords: Learning disabilities, Neuroscience, Quasi-experimental research, Special education

Presenting Author:Mateja Hudoklin, University of Ljubljana, Slovenia; **Co-Author:**Cirila Peklaj, University of Ljubljana, Slovenia

Executive functions help us plan and organize activities, sustain attention and persist in completing tasks. Research showed that students with specific learning disabilities (SLD) also have difficulties with executive functions. It has been confirmed that executive functioning can compensate primary deficits of SDL. The aim of our study was to develop and evaluate an intervention program for improving executive functions in students with SDL (dyslexia and dysgraphia). Our research included 97 ten years old students who had diagnose of severe dyslexia and dysgraphia. Students were assigned to experimental (EG) and control group (CG). Students in ES received regular help program and additional 30-hours executive functions training. Students in CG received only regular help program. The results of measurement of executive functions before and after intervention have shown a short term effect related to attention, however, after five months the effect is not significant any more. Teacher and parents reported positive effects of different executive functions after five months, namely in inhibition, initiative, working memory, self-monitoring, behaviour regulation and metacognition. The results confirmed efficacy of intervention, although important changes in behaviour can be seen after a longer period. Key words: dyslexia, dysgraphia, executive functions, intervention, specific learning disabilities

Development of an orthographic knowledge test to differentiate reading and spelling skill levels

Keywords: Educational Psychology, Learning and developmental difficulties, Literacy, Primary education

Presenting Author:Jelena Zaric, German Institute for International Educational Research (DIPF); IDeA-Research Center, Germany

Word-specific and general orthographic knowledge (i. e. knowledge about the correct spelling of specific words and permitted letter patterns), play an important role in acquiring reading and spelling skills (Burt & Tate, 2002; Holmes, 1996). However, the most effective method assessing these two orthographic knowledge components is still unclear. The goal of this study was therefore to develop an adequate test to measure orthographic knowledge for German elementary school children on the word-specific and general level. The child-oriented childLex database (Schroeder, Wurzner, Heister, Geyken & Kliegl, 2015) was used for developing test items. An orthographic choice task was designed to measure word-specific orthographic knowledge. To assess general orthographic knowledge, two tasks involving pseudo-word pairs with different violation types (i. e. sensitivity to frequency and to legal positions of letter patterns) were developed. A sample of 67 German children, divided into two groups (with and without reading and spelling difficulties) participated in this study. Reading and spelling skills were measured via standardized achievement tests and compared with the performance on the orthographic knowledge tasks. Analyses revealed significantly better performance of children without reading and spelling

difficulties on the orthographic-choice task and on task comprising frequency of letter patterns compared to children with reading and spelling difficulties. Thus, these two tasks can be considered as an effective method to assess word-specific and general orthographic knowledge, and can be used to differentiate between children with and without reading and spelling difficulties. However, poor internal consistency indicates that the test items need further development.

Early Mathematical Skills of Children in South Africa and in Finland

Keywords: Achievement, Assessment methods and tools, Early childhood education, Mathematics

Presenting Author:Riikka Mononen, University of Oslo, Norway; **Co-Author:**Johan Korhonen, Åbo Akademi University, Finland; **Co-Author:**Lara Ragpot, University of Johannesburg, Unknown; **Co-Author:**Elizabeth Henning, University of Johannesburg, South Africa; **Co-Author:**Pirjo Aunio, University of Oslo / University of Helsinki, Finland

Abstract (246 words) This study compared the early mathematical skills of South African ($N = 443$, *Age* 6.80 y) and Finnish children ($N = 236$, *Age* = 6.23 y) in the beginning of their formal mathematics education. Children's mathematical skills were assessed using a test developed in Finland, and a translated version in English was used in South Africa. No statistically significant difference was found between the South African (SA) and the Finnish (FIN) children in mathematical relational and counting skills. However, the FIN children performed better in basic arithmetic skills (verbal word problems). Overall, girls and boys performed equally well, but boys outperformed girls in counting skills in the SA sample. Younger children performed somewhat weaker than older children. According to the results, when compared to each other, FIN and SA children seem to have little difference in their early mathematical skills in the beginning of the formal education. However, according to the international comparative assessments in mathematics, the students in these countries seem to perform in contrast to each other in the end of their compulsory school – Finland in the top and South Africa in the lowest performing countries. In future, it would be thus interesting to investigate how educational setting (e.g., teacher's pedagogical knowledge, group size, mathematics content taught and educational support), home language and socioeconomic status affect mathematics learning along the school years, and to find possible obstacles that could be improved in order to provide ingredients for better and equal learning of all children.

What do MOOC providers think about accessibility?

Keywords: E-learning / Online learning, Learning disabilities, Qualitative methods, Lifelong learning

Presenting Author:Francisco Iniesto, Open University, United Kingdom; **Co-Author:**Patrick McAndrew, Open University, United Kingdom; **Co-Author:**Shailey Minocha, Open University, United Kingdom; **Co-Author:**Tim Coughlan, Open University, United Kingdom

Massive Online Open Courses (MOOCs) have become an accepted way to make learning opportunities available at large scale and low cost to the learner. However, only if these are made accessible will they be able to offer flexibility of learning and benefits to all, irrespective of disability. Experience in providing accessible online learning at distance universities suggests that this can be best achieved through understanding different roles and the options in planning for adjustments to be made. To effectively apply similar approaches to MOOCs, it is necessary to understand the various viewpoints and roles of stakeholders and how these impact on accessibility. This includes educators who create materials and facilitate learning, and technologists who develop and maintain platforms. We report the results from a study involving semi-structured interviews to investigate the perceptions and accessibility-related processes of MOOC platform accessibility managers, platform software developers/designers and MOOC accessibility researchers. Our results show awareness that MOOCs can be valuable for disabled learners, and indicate that legislation acts as a driver for accessibility. However, our investigations suggest limited progress to date in either producing universally accessible MOOCs, or tailoring MOOCs to meet the needs of individual learners with disabilities

Session C 19

30 August 2017 08:30 - 10:00

Learning patterns, personal factors and academic performance in students at Primary School

Keywords: Educational Psychology, Learning approaches, Primary education, Student learning

Presenting Author:Jordi García-Orriols, Autonomous University of Barcelona, Spain; **Co-Author:**Jose Reinaldo Martinez-Fernandez, Autonomous University of Barcelona, Spain

The aim of this study was to analyze the relationship between learning patterns and some personal factors and academic

performance in students at primary education. Methodology: 229 students of Primary Education from Spain completed an adapted version of ILS (Inventory of Learning Styles) (Vermunt, 1998). Findings: We found four patterns: *meaning-directed* (MD); *reproduction-directed* (RD); *application directed* (AD) and *undirected* (UD) pattern; according to Vermunt. Regards personal factors differences according gender, effort and academic self-concept were found. Taking into account these findings, from a theoretical and Education significance of the research we support the accurate of Vermunt model (1998) based on four pattern. In addition, each one is influenced by and has a relationship between some personal factors and the GPA. Finally, a new challenger about education could be introduced, which must consider teaching and learning processes as a way of maximizing MD/AD patterns in students and caring for students with RD/UD patterns.

Oral Language and Early Literacy skills in Brazilian preschool children

Keywords: Achievement, At-risk students, Early childhood education, Literacy

Presenting Author:Rute Tomás, University of Luxembourg, Luxembourg; **Co-Author:**Carolina Nikaedo, University of Luxembourg, Faculty of Language and Literature, Humanities, Arts and Educational Sciences (FLSHASE), Luxembourg; **Co-Author:**Elizeu Macedo, Universidade Presbiteriana Mackenzie, Brazil; **Co-Author:**Pascale Engel de Abreu, University of Luxembourg, Luxembourg

In Brazil, many students perform below the expected levels on literacy. Children that fail to learn to read and write are at high risk of school failure and this risk is positively associated with low socio-economic status. Reading is a complex task that depends on a range of cognitive skills. Letter sound knowledge, phonological awareness, oral language and rapid automatized naming are important predictors for literacy acquisition. Preschool children with difficulties in any of these abilities are at risk of low literacy levels in primary school. Recent studies suggest that individual differences in literacy acquisition are detectable before formal school enrolment and targeted early interventions can improve the reading outcomes of these children. These studies have, however, almost exclusively been conducted in developed countries and less is known about individual differences in the cognitive processes of reading in children from countries with high levels of inequality. This study sought to fill this gap. One hundred preschool Brazilian children, from public and private preschools (4-5 years of age) took part in the study. Children completed a battery of tests tapping into oral language, phonological awareness, letter knowledge, rapid automatized naming and non-verbal reasoning. Results will be analysed using an individual differences approach to explore the cognitive skills related to reading in a sample of preschool Brazilian children from a wide range of socioeconomic status backgrounds. This study has important implications in relation to the detection of children at risk of developing reading difficulties in a developing country.

Relationship between language and early numerical development in children at the age of kindergarten

Keywords: Early childhood education, Mathematics, Numeracy, Quantitative methods

Presenting Author:Silvia Pixner, Institute of Psychology, UMIT, Health & Life Sciences University, Austria

There is still a lack of clarity how close language development and numerical development in early childhood are connected. Since both are very complex constructs, the aim of our present study was two-folded. First we focused on the relationship between the development of number words (i. e., 1, 2, 3) and the quantifier (i. e., more, many, a few), especially depending on vocabulary. Does the acquisition of quantifier possibly support the acquisition of certain number words or are these probably two completely detached systems? The second aim of our study was to analyze in this context the role of zero and the negation-quantifiers, i. e., "nothing" or "none". Do the children acquire an understanding of zero with the help of the negation-quantifiers, or are they as well independent of each other? In this longitudinal study a total of 73 monolingual German-speaking children between 3.6 and 4.6 years of age (33 boys and 40 girls) were examined in a first measurement. In addition to vocabulary and spatial orientation (measured by standardized methods), the focus was on the numerical development. The cardinality of certain magnitudes (0-5), as well as the understanding of quantifiers were operationalized with a give-N task.

Children's ideas about participation and their effect on sociocognitive development

Keywords: Citizenship education, Cognitive development, Early childhood education, Social development

Presenting Author:Nadine Correia, University Institute of Lisbon (ISCTE - IUL), Portugal; **Co-Author:**Margarida Fialho, ISCTE-IU, Portugal; **Co-Author:**Cecília Aguiar, University Institute of Lisbon (ISCTE - IUL), Portugal

Children's participation right has gained scale in the research field. The positive relationship between children's participation and the quality of preschool contexts is documented and indicates that children who attend high-quality preschool settings report more opportunities to participate or exert influence (Sheridan, 2007). Because children's participation is a criterion to be taken into account when evaluating preschool quality and there still exist few studies on this topic, we aimed to investigate the associations between children's ideas about participation, self-concept, assertiveness, and self-control, classroom quality, and teacher's perceptions about children's participation. Specifically, classroom quality and teachers' perceptions will be tested as moderators of the relationship between children's ideas and children's sociocognitive outcomes. Participants were (a) 60 preschool teachers, which filled in the questionnaire on "Teacher's perceptions about the implementation of children's participation right in preschool settings"; (b) 60 preschool classrooms of the Lisbon area, observed with the Classroom Assessment Scoring System (CLASS; Pianta, La Paro, & Hamre, 2008), and (c) 360 children attending those classes, assessed with the Portuguese version of the Social Skills Rating System (Gresham & Elliott, 1990), the Portuguese adaptation of The Pictorial Scale of Perceived Competence and Social Acceptance for Young Children (Harter & Pike, 1984; Mata, Monteiro, & Peixoto, 2008), and interviewed with "Choosing

classrooms: A structured interview on children's participation right". Associations between variables will be analysed and preliminary results will be presented.

Exploring the relationship between learning patterns, academic talent and GPA in primary school

Keywords: Early childhood education, Educational Psychology, Learning approaches, Primary education

Presenting Author: Laura Garcia Ravidá, Autonomous University of Barcelona, Spain; **Co-Author:** Jose Reinaldo Martinez-Fernandez, Autonomous University of Barcelona, Spain; **Co-Author:** Juan Marin, Escola La Salut, Spain

The aim of this study was to analyse the relationship between learning patterns, academic talent and the grade point average (GPA) on students of primary school. Methodology: the participants were 54 students from 4th grade of primary education in a school of Barcelona (Spain). They complete the Inventory of Learning Styles (ILS) and the School and College Ability Test III (SCAT III). Data were analysed from a correlation tests, factor analysis and cluster analysis. There were two relevant findings: First, the results showed a relationship between learning patterns (*Application-directed* and *Reproduction-directed*) with the academic performance. Second, the academic talent is confirmed as an adequate predictor of academic performance; but it is not related with learning pattern. We consider that it is necessary to inquiry more in depth the role of assessment (GPA) as to what it measures.

The early home learning environment as a protective factor for early adolescent coping with life

Keywords: Early childhood education, Educational attainment, Environmental education, Quantitative methods

Presenting Author: Sabine Blaurock, University of Bamberg, Germany; **Co-Author:** Simone Lehl, University of Bamberg, Germany

The quality of the home learning environment (HLE) is widely recognized as a contributor to children's competence development, social functioning and to their subsequent educational success (e.g. Bradley, 2015). The present study examined the relations between child and family risk factors (e.g. low maternal education etc.), the quality of the HLE in early childhood and adolescent's educational attainment and problem behavior. All the data are based on the German longitudinal study BiKS and the follow-up study BiKS^{plus}[3-13], which final follows 229 children from preschool age till age of 13. A mediation model was hypothesized and tested using pathway analysis. The findings show that exposure to social risk in early childhood predicted educational attainment negatively and risk-taking behavior and conduct problems positively. Furthermore, the negative association between risk and educational attainment were substantially weakened when children have experienced high stimulation at home in early childhood and additionally in early adolescence. Results are discussed regarding the longer-term protective potential of high stimulation at home for later coping with life.

The recursive nature of the writing process: editing strategies of professional literary authors

Keywords: Language (L1/Standard Language), Literacy, Teaching approaches, Writing / Literacy

Presenting Author: Susan Jones, University of Exeter, United Kingdom; **Co-Author:** Floor Buschenhenke, Huygens ING, Netherlands

Cognitive research into the writing process indicates that revision is a 'cognitively complex and costly process' (Chanquoy 2001) but that expert writers spend more time on revision, make changes to the text which are more substantive, and have a stronger sense of how they want the text to be (Sharples 1999). In contrast, novice writers tend to make few changes or focus on surface features such as spelling. Theoretical understanding of revision distinguishes between pre-text revision, which includes evaluation and refinement of ideas at the planning stage; online revision which occurs during writing, and deferred revision which happens when a draft is complete (Allal et al 2004). A further distinction is made between revision which focuses on error-correction and revision which transforms the text, including alterations to meaning. At the heart of revision is the capacity for the writer perceive a sense of dissonance between the text and the writer's intention, but this is difficult for developing writers (Hollaway and McCutchen 2004). We know that that professional writers revise more than developing writers; however, many empirical studies rely on self-report. This study was set up to explore the possibilities of keystroke logging for tracking the writing processes of literary authors. For the current presentation, the focus is on investigating the editing strategies observed in the four participants in our study, supplemented with interview data, and considering how this might inform the teaching of revision skills to less proficient writers.

Analysis of the strategy-focused instruction for improving writing competence

Keywords: Instructional design, Primary education, Teaching / instruction, Writing / Literacy

Presenting Author:Rut Sanchez, University of León, Spain; **Co-Author:**Paula Lopez, University of León, Spain; **Co-Author:**Alba Gonzalez, University of León, Spain; **Co-Author:**Raquel Fidalgo, University of León, Spain, Spain

Strategy-focused instruction has been considered the most effective approach for improving students' writing skills. Nevertheless, this kind of instruction has been implemented specially in upper grades of Primary Education versus the instruction on transcription processes in the first grades of this scholar stage. Therefore, the current study explores the effectiveness of the strategy-focused instruction in students of 3rd grade of primary education and the specific contribution of the type of practice implemented in the strategy-focused instruction, individual or collaborative. Also, the students' writing style will be taken into account to explore its influence in the intervention effectiveness. The sample comprised 72 students of 3rd grade of primary education divided in 3 classrooms within the same school. Two classrooms, randomly chosen, formed the experimental condition where it was implemented a strategy-focused program for the improvement of the writing competence focused on planning and drafting processes. Complementary, in one of the experimental groups students worked individually whereas in the another experimental group, students worked in a collaborative way, with the roles of writer and helper. Finally, the third group, in the control condition, received an instruction based on the promotion of motivation and creativity for the improvement of the writing competence. The study followed a quasi-experimental design with three evaluation times: pretest-posttest-follow up (2 months after the intervention). Textual productivity, organization and quality measures were taken, as well as measures related to students' writing style. Currently, analyses are being carried out, therefore the results and conclusions will be showed in the congress.

The SRSD + ICT model improves the writing skills of 4th grade students

Keywords: Instructional design, Primary education, Quasi-experimental research, Writing / Literacy

Presenting Author:Catarina Araújo, Institute of Education - University of Minho, Portugal; **Co-Author:**Ana Paula Loução Martins, Institute of Education, University of Minho, Portugal; **Co-Author:**António José Osório, Institute of Education, University of Minho, Portugal

Writing is an important, complex and demanding process, where students and teachers show difficulties (Graham & Hall, 2016). The Self-Regulated Strategy Development (SRSD) model and some technological tools provide scientific efficiency in writing (MacArthur, 2009). The aim of this study was to analyze the impact of using the SRSD model with and without the use of ICT in the performance of writing opinion essays by 4th grade students, with and without writing problems; The sample was composed by 178 4th grade students, organized equally in two groups (n = 78). Group 1 received SRSD model intervention (Karen, 1982) using ICT, and through regulated processes, while group 2 did not use ICT. Performance in writing opinion essays was assessed before and after the interventions according to: writing elements, composing quality, length and number of linking words. Each intervention lasted for 12 weeks (90 minutes per week); The results indicated a positive impact of SRSD and SRSD + ICT intervention in writing performance (writing elements, composing quality and number of linking words), presenting highly and very large magnitude of effect. Successively, we found a highly significant effect, with very large magnitude, of SRSD + ICT intervention compared to SRSD intervention on writing quality and the number of linking words; The results reinforce the relevance of using the SRSD model and the effectiveness of the integration of ICT, through self-regulation processes, on opinion essay writing performance. The theoretical, educational and political implications will be discussed. In the future it is suggested the implementation of these interventions, in other contexts and with different samples.

Text quality, writing processes and students' beliefs about writing at Secondary education in Chile

Keywords: Attitudes and beliefs, Language (L1/Standard Language), Secondary education, Writing / Literacy

Presenting Author:Magdalena Flores, University of Amsterdam, Netherlands; **Co-Author:**Gert Rijlaarsdam, University of Amsterdam, Netherlands; **Co-Author:**Daphne van Weijen, University of Amsterdam, Netherlands

At the end of school age many Chilean students demonstrate deficiencies in their academic writing skills. With the aim of providing information for improving this situation, this study aims to establish relationships between text quality, writing processes and students' beliefs. Participants will be sixty 7th students and sixty 11th grade students, from three different public schools. The method of the study will include two writing tasks and replying to a questionnaire. First, students will write an argumentative text (Task 1). Data of their writing processes will be recorded through Inputlog, a keystroke logging program. Second, students will respond a questionnaire about their motivation and conceptualizations concerning the first task. Third, students will write a letter to a fictitious new classmate, explaining him what should be done to achieve a better text in Task 1. Data will be collected in August 2017. After the analysis, statistical operations will be applied to determine correlations between the three sources of the data.

Learning to be a good Reviewer: the effects of reviewing on one's own writing

Keywords: Educational Psychology, Higher education, Peer interaction, Writing / Literacy

Presenting Author:Marta Pardo Estruch, Ramon Llull University, Spain; **Co-Author:**Montserrat Castelló, Ramon Llull University, Spain

In this research we have developed and evaluated an intervention based on the use of collaborative review as a means of enhancing and overcoming difficulties during the writing process from the reviewers' perspective. Our main goal was to

explore what kind of comments promoted deep revision and how offering comments on peer' drafts could help to improve reviewers' own writing. We adopted a longitudinal interpretive mixed method design that combined quantitative and qualitative data where 49 undergraduate students played two different roles: writers and reviewers (20.4% men - 79.6% women). We developed orientations and a writing guideline in order to help students during the revision process. Indeed, some specific instruments were developed to assess: a) final text quality (text assessment grid); b) reviewer's comments regarding their type and function (comments assessment grid); and c) changes that student- writers made in their texts - after receiving comments from their peers- according to acceptance or rejection, quality of the introduced and eluded changes and impact of changes in text (revision strategies grid). Results confirmed that deep revisions enhanced writing performance and highlighted collaborative reviewing as a useful way to learn to write and as a means for learning disciplinary knowledge. Moreover, results also showed that deep revision was related to develop a position as an author in one's own text, meaning dialoguing with others authors and establishing alignment with a particular position. Keywords: reviewer; collaborative peer revision; deep revision; writing performance; academic writing

Delving into the subjective frequency estimates in Spanish. On what are the estimations based on?

Keywords: Cognitive development, Cognitive skills, Literacy, Writing / Literacy

Presenting Author:M^a Emma García Pérez, Pontifical University of Salamanca, Spain

We collected subjective frequency estimates for 1,080 Spanish words of varied objective frequency. Specifically, 248 children (11-12 years) provided estimates of a sample of 615 words and 120 adults (20-26 years) estimated 465 words. Both groups rated the words on a 5-point scale from never encountered to encountered very often in four perceptual domains, that is, writing (FSE), reading (FSL), hearing (FSO) and speaking (FSD). ANOVA and regression analyses confirmed the results obtained in the English language for the adult population (Balota, Pilotti and Cortese, 2001). We found that subjective frequency estimates depend more on our knowledge of how many times we have spoken or heard a word rather than how many times we have written or read it. FSD (frequency of encounters in speaking) accounted for most of the variance in general subjective frequency (FSG). Added to this, the relevance of this work also depends on the kind of population employed for this study.

Session C 21

30 August 2017 08:30 - 10:00

Main Building A - A31

Poster Presentation

Motivational, Social and Affective Processes

PO: Motivation and Educational Psychology

Keywords: Assessment methods and tools, Attitudes and beliefs, Collaborative Learning, Educational Psychology, Educational Technology, Emotion and affect, Higher education, Mathematics, Motivation, Out-of-school learning, Parental involvement in learning, Quasi-experimental research, Science education, Self-regulation, Teacher Effectiveness, Teaching / instruction, Video analysis, Vocational education

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Joerg-Tobias Kuhn, University of Münster, Germany

Does training to reflect on action foster reflection in action and finally on-the-job performance?

Keywords: Educational Technology, Quasi-experimental research, Video analysis, Vocational education

Presenting Author:Elisa Motta, Swiss Federal Institute for Vocational Education and Training, Switzerland; **Co-**

Author:Alberto Cattaneo, Swiss Federal Institute for Vocational Education and Training (SFIVET), Switzerland

According to the experiential learning approach, reflection leads the transformation of experiences in learning and can be classified as reflection *on* and *in* action depending if happening after or during the professional's performance. After a previous phase where we demonstrated the effectiveness of promoting reflection *on* action through instructional activities based on metacognitive prompts, we now present a study aimed at investigating 1. to what extent getting apprentices used to metacognitive prompts to reflect *on* action was also a way to promote their reflection *in* action; 2. to what extent reflection resulted in quality improvement within their professional performance; 3. if the exposition to reflective prompts during instructional activities at school promoted apprentices' long-term attitude to reflect *on* action. Apprentice chefs (9 belonged to the experimental group in the previous phase and 7 to the control group) were invited to perform a recipe and, when finished, to fill in a personal report to self-evaluate their performance. All the utterances were video-taped and the thinking aloud protocol analyzed. The experimental group outperformed the control group in the level of both reflection *in* and *on* action. The quality of the performance was also higher in the former group, according to experts' evaluation; qualitative data confirmed the approach had concrete consequences on apprentices' professional daily life. Despite its limitations in sample size, the study represents an interesting premise to deepen the feasibility of our pedagogical approach in vocational education and training across professions.

Predicting teachers' flow experience and job satisfaction from need satisfaction and frustration

Keywords: Educational Psychology, Motivation, Teacher Effectiveness, Teaching / instruction

Presenting Author:YoonJung Cho, Sungshin Women's University, Korea, Republic of; **Co-Author:**Sungok Serena Shim,

Ample evidence on the utility of students' need satisfaction has been documented, however, very few studies have addressed the importance of teachers' need satisfaction for their optimal functioning and psychological well-being. The present study focused on examining in what ways teachers' psychological needs for competence, autonomy, and relatedness are satisfied and/or frustrated and how teachers' need satisfaction and/or need frustration is related to teachers' optimal functioning as indicated by teachers' flow experience and job satisfaction. Person-centered analysis was conducted using six standardized variables (three need satisfaction scales and three need frustration sub-scales). K-means cluster analysis revealed three distinct groups: An average group with all six dimensions around the means, need-satisfied group with high need satisfaction scores but low need frustration scores, and a need-frustrated group with low need satisfaction scores and high need frustration scores. Results indicated that the need-satisfied teachers are less likely to leave the profession and furthermore, they tend to report more frequent flow experiences during teaching. Need-satisfied teachers showed most optimal functioning among the three groups that vary in terms of need satisfaction and need frustration. High need satisfaction accompanied by low need frustration will lay a foundation for teachers to flourish at work with high job satisfaction and less intention to leave.

The Effects of Private Tutoring on the Learning Context at Home

Keywords: Mathematics, Out-of-school learning, Parental involvement in learning, Quasi-experimental research

Presenting Author:Barbara Otto, Ludwigsburg University of Education, Germany; **Co-Author:**Christian Müller, Goethe-University Frankfurt, Germany

The prevalence of private tutoring in Germany is rather high compared to other European countries. Particularly low-achieving students get enrolled in this kind of shadow education in order to enhance their academic achievement. Despite of the high prevalence of private tutoring in Germany the investigation of its effectiveness has been neglected so far. Only a handful of studies have been examined this research field in a methodologically adequate way. Moreover, most of these refer to academic achievement or students' motivation as dependent variables. As empirical studies also revealed low academic achievement is also associated with conflicts at home suggesting that attending private tutoring should also enhance students' learning climate at home. Therefore, the current study aimed at the investigation of the effects of private tutoring on students' perceptions of their parents' involvement and the parent-child relationship.

38 students who were newly enrolled in a tutoring institute and a matched control group voluntarily participated in the longitudinal study. Data were assessed by a questionnaire that was applied two times (first: right after enrollment; second three months later). In order to answer the research question, analyses of variance with repeated measures were conducted separately for both dependent measures. The results of the analysis for parental involvement did not show a significant interaction effect. In contrast, tutored students reported on an enhancement of the parent-child relationship whereas students of the control group indicated a drop. These results are discussed with regard to their theoretical and practical implications.

Group Processes in College Classrooms: A Control-Value Theory Framework

Keywords: Attitudes and beliefs, Collaborative Learning, Emotion and affect, Higher education

Presenting Author:Jeannine Turner, Florida State University, United States; **Co-Author:**Jessica Summers, University of Arizona, United States

Framed by Control-Value Theory and Social Interdependence Theory, we conducted longitudinal analysis of two undergraduate courses that used group-work. In one course, students' group work contributed to over 50% percent of the final course grade (high stakes) while in the other course, students' group work contributed to only 1/3 of the final course grade (low stakes). At the beginning of the semester we assessed students' perceptions regarding their control of group-work processes, their valuing of group-work processes, and their prospective emotions about participating within group-work, and subsequently assessed their group-work emotions and perceptions of group knowledge-building at the end of the semester. Structural equation modeling demonstrated five major findings: (1) initial expectancies of group-work processes are closely related to immediate prospective emotions; (2) initial valuing of group-work processes are more related to distal experienced group-work emotions than prospective emotions, (3) the best predictor of experienced emotions is the anticipation of experiencing the emotion, (4) if students expect positive outcomes of group-work, they tend to also value group-work processes, experience enjoyment during group-work interactions, and perceive support for group-related learning, and (5) when students experience group-work anxiety or anger they do not experience the benefits of group-learning. The implications of these findings are discussed with respect to future research.

Measuring Science Attitudes: Two Studies Using a Motivation Framework

Keywords: Assessment methods and tools, Attitudes and beliefs, Motivation, Science education

Presenting Author:David Bergin, University of Missouri/Columbia, United States; **Co-Author:**Christi Bergin, University of Missouri/Columbia, United States; **Co-Author:**Chia-Lin Tsai, University of Missouri/Columbia, United States; **Co-Author:**Christopher Murakami, University of Missouri/Columbia, United States

Many interventions seek to improve students' attitude toward science and need a tool to measure this important outcome. This article addresses the development of a self-report measure of student motivation regarding science. The Science

Attitude Measure (SAM) was developed to address key motivational variables. Psychometric properties of the Science Attitude Measure (SAM) were assessed in two studies: (1) 1,351 high school freshmen in physics classes, (2) 3,085 high school seniors who reported regarding their science class. In Study 1, exploratory factor analysis suggested 4 factors (expectancy, value, cost, and identity/career interest), which confirmatory factor analysis supported. Invariance was demonstrated for gender and ethnicity (White and non-White). SAM scales correlated significantly with classroom engagement and other variables, which was further demonstration of validity. Study 2 confirmed results from Study 1. In conclusion, the 18-item SAM is aligned with major motivation theories, shows psychometric validity, and is a viable assessment of science attitudes across high school.

Second grade students' parents' ability beliefs and the quality of their homework involvement

Keywords: Attitudes and beliefs, Parental involvement in learning, Self-regulation, Teaching / instruction

Presenting Author:Grete Arro, Tallinn University, Estonia; **Co-Author:**Kati Aus, Institute of Psychology, Estonia

Supporting the development of self-regulatory processes is one of the many tasks of teachers, but the context of homework assigned by teachers to be completed at home is also a valuable resource for developing learning skills and self-regulation. According to research, one of the indicators of positive parental homework involvement is the ability of the parents to be autonomy supportive. There is ample evidence suggesting that people's implicit theories about the malleability of different personality attributes (incl. cognitive abilities) are associated with their behaviour in achievement contexts or otherwise demanding situations and possibly also their helping or directing of others in demanding situations. Current study aims to see whether parents' ability beliefs are associated with their autonomy supportive and structure offering versus controlling behaviour when it comes to parents' everyday involvement in their children's homework. Data on 162 parents of second grade students indicated that whereas entity beliefs about learning skills bore positive associations with parents' controlling as well as structuring behaviour during assisting with homework, beliefs about the malleability of general intelligence were not associated with parental homework behaviour. The results bear important implications for targeting specific belief-sets when addressing parents' possibilities for better supporting the development of their children's self-regulatory processes.

Defining Consistency in Higher Education

Keywords: Conceptual change, Educational policy, Higher education, Survey Research

Presenting Author:Julian Dehne, University of Potsdam, Germany; **Co-Author:**Thi Nguyen, University of Potsdam, Germany; **Co-Author:**Ulrike Lucke, University of Potsdam, Germany

Consistency in higher education research has been a largely ignored subject. We define consistency in this context and present arguments as to whether it can be regarded as scientifically relevant. Furthermore, we tested our model in a quantitative study at our university. The statistics show that 57,9% of students perceive contradictions within their course work while 23,3% perceive unnecessary repetitions, while the concept of sequentiality correlates with certain aspects of study organization as well as with student's satisfaction. The results are discussed and linked to the larger paradigm of learning outcome oriented pedagogies and the current trend of modularization following the Bologna process.

I like to make people laugh: Adult playfulness among educators

Keywords: Competencies, Higher education, In-service teacher education, Quantitative methods

Presenting Author:Pirkko Siklander, University of Lapland, Finland; **Co-Author:**Marjaana Kangas, University of Lapland, Finland; **Co-Author:**Justus Randolph, Mercer University, United States; **Co-Author:**Heli Ruokamo, University of Lapland, Finland

All educators need to be creative and playful when designing teaching and learning activities, and acknowledging their potential for playfulness competence is important. Playfulness as a personality trait and as a quality of activities is studied widely in children but less often in adults. To explore adult playfulness, we use a Finnish language version of Staempfi's (2005; 2007) adult playfulness scale (APS). The participants (N=123) are educators or students in educational fields. The results reveal that playfulness is mostly consistent between different age groups and that men are slightly less playful than women. These results confirm those of our earlier studies and indicate that playfulness includes insight, creativity, imagination, embodiment and emotionality. The results of this study will be used to design our subsequent qualitative study and to design teaching and learning in teacher education programmes.

Does motivation explain different achievement of preservice teachers and psychology students?

Keywords: Action research, Design based research, Higher education, Teaching approaches

Presenting Author: Eva Seifried, Heidelberg University, Germany; **Co-Author:** Birgit Spinath, Heidelberg University, Germany

It is often assumed that preservice teachers are not motivated for courses other than their future teaching subjects (e.g., courses in psychology), and that their low motivation is relevant for their (low) learning outcomes. To test this assumption, we collected data on both preservice teachers' and psychology students' achievement aspirations as well as further motivational and cognitive learning prerequisites in parallel lectures "Introduction to Educational Psychology" at a German university in two semesters ($N = 294/275$ preservice teachers and $N = 129/122$ psychology students). We found that preservice teachers did not differ from psychology students in their achievement aspirations and most of the other learning prerequisites in a negative way. For the preservice teachers, achievement aspirations were only weakly correlated with examination performance but students' school grade point average (GPA) was the best predictor of performance for both student groups. The significance of the aforementioned variables and further learning prerequisites (e.g., (objective) prior knowledge and subjective knowledge) will be discussed.

Using a person-centered approach in identifying regulation profiles among Finnish medical students

Keywords: Higher education, Quantitative methods, Self-regulation, Survey Research

Presenting Author: Henna Vilppu, University of Turku, Finland; **Co-Author:** Eero Laakkonen, University of Turku, Finland; **Co-Author:** Mirjamaija Mikkilä-Erdmann, University of Turku, Finland; **Co-Author:** Pekka Kääpä, University of Turku, Finland

In this study we were interested in how medical students regulate their learning during the first 3 years in medical school and to what extent this regulation is connected with study success. Additionally, the functionality of a shortened version of regulation scales of the Inventory of Learning Styles (Vermunt, 1994) was analyzed in medical education context. The participants of the study were 162 medical and dental students, who answered the regulation scale at three measurement points. The analyses yielded a three-factor solution, which was reliable across time. Four profiles of regulation strategies were identified. Our results showed that these profiles were connected to study success: Students with lowest self-regulation and increasing lack of regulation performed worse than the other groups. Our longitudinal, within-subjects study is a valuable contribution to the field of research into academic learning. Using a person-centered approach along with more traditional variable-centered approach increases understanding of the complex nature of learning in higher education. Further, since the approach enables us to individualize students with different regulation strategy patterns, it could be used as a tool for supporting student learning and to help early diagnosing of learning difficulties.

Students' experience of interactive teaching by means of a digital response system

Keywords: Action research, Design based research, Higher education, Teaching approaches

Presenting Author: Åge Diseth, University of Bergen, Norway

Digital response systems, often labelled as SRS (Student Response Systems), enable interaction in the lecture situation by assigning subject relevant quizzes to the students and by providing immediate feedback to them. It also provides feedback to lecturers regarding the level of knowledge among their students. Hence, use of SRS has potential within the framework of Scholarship of Teaching and Learning (SoTL). This presentation shows how the students experienced utilization of SRS. Students were assigned subject relevant quizzes during the lecture by means of a web-based SRS (Socrative) which they utilized by means of their own devices (e.g., smartphones, laptops, tablets). The participants were subsequently asked to report their satisfaction with use of SRS in terms of items reflecting motivation, learning, interaction, and engagement during lectures. They reported a high degree of satisfaction, in particular regarding the possibility to disclose limitations in their own knowledge of the subject matter. Students who expected relatively weaker exam performance reported a somewhat higher degree of usefulness of SRS compared to students who expected better performance. These results were discussed with reference to the test-effect and to possible experience of flow in the learning situation. In conclusion, this presentation highlights the importance of constructing quizzes beyond testing of students' remembrance of particular topics. In particular, it seems important to also test students understanding in terms of analysis, evaluation, application, and creation of new knowledge.

Relationship between conceptions of learning, teamwork conceptions and GPA among undergraduates

Keywords: Collaborative Learning, Educational Psychology, Higher education, Learning approaches

Presenting Author: Laia Encinar Prat, Autonomous University of Barcelona, Spain; **Co-Author:** Marc Martínez-Pons, UAB Universitat Autònoma de Barcelona, Spain; **Co-Author:** Jose Reinaldo Martinez-Fernandez, Autonomous University of Barcelona, Spain

The aim of this study was to analyse the relationship between conceptions of learning, teamwork conceptions and academic performance (GPA) during the first year of tertiary education in the specific domain of Educational Sciences. Methodology: Participants were 84 undergraduates in Educational Sciences from Spain. They completed the learning conceptions questionnaire (CONAPRE) and the Conceptions about Teamwork Questionnaire (CTQ). At the same time, their GPA average was obtained. Findings: The results show a significant relationship between different conceptions of learning and teamwork conceptions, while only one of teamwork conception has a significant connection with GPA. Beyond these findings, it is worth it to continue towards a theoretical discussion about the relationships between learning and

teamwork conceptions in tertiary conceptions and how their can influence in the academic performance.

Different visual patterns for game-based learners with high and low self-efficacy of game playing

Keywords: Game-based learning, Learning Technologies, Neuroscience, Self-efficacy

Presenting Author: Meng-Jung Tsai, National Taiwan University of Science & Technology, Taiwan; **Co-Author:** Chung-Yuan Hsu, National Pingtung University of Science and Technology, Taiwan; **Co-Author:** Guo-Li Chiou, National Taiwan University of Science and Technology, Taiwan; **Co-Author:** Ching-Yeh Wang, National Taiwan University of Science and Technology, Taiwan; **Co-Author:** An-Hsuan Wu, National Taiwan University of Science and Technology, Taiwan

This study aimed to explore the visual patterns for learners during a game-based physics learning environment, especially for the learners with different self-efficacy toward the game playing. A Shadow Game with a meta-cognitive scaffolding design for learning the concept of light and shadow was used in this study. A total of 47 college students participated in the game-based learning eye-tracking experiment during which their eye-movements were tracked and recorded by an ASL MobileEye eye-tracker. At most ten minutes were allowed for each participant to play in this experiment. Participants' self-efficacies about game playing were assessed by a self-reported questionnaire right after the game playing. All eye-tracking measures on areas of interests were compared between the high and the low self-efficacy groups. Sequential analyses were further analyzed for the two groups. The preliminary results showed that there were different visual patterns between the high and the low self-efficacy learners, in terms of visual attention distributions and visual attention transfers. The high self-efficacy players seemed to be able to focus on utilizing the meta-cognitive tools. The low self-efficacy players might need to make more efforts on recalling the correlation between the sunlight schedule and the shadow length. This study provided some suggestions for future research and designs of physics game-based learning. All of the implications will be discussed in the conference.

Effects of a Training Intervention on Knowledge Integration in Physics

Keywords: Experimental studies, Instructional design, Misconceptions, Science education

Presenting Author: Markus H. Hefter, Bielefeld University, Germany; **Co-Author:** Kirsten Berthold, University of Bielefeld, Germany

In scientific domains such as physics, the naïve concepts learners bring to the classroom can be in conflict with the correct scientific concepts that are meant to be learned. Following the knowledge integration approach, learners should dispute, evaluate, and connect the naïve and scientific concepts and thereby establish a deep scientific understanding. It seems feasible to develop and test appropriate instructional approaches to foster such knowledge integration of naïve and scientific concepts. Thus, our aim is developing a short-term training intervention on knowledge integration in the domain of physics. We plan to conduct an experimental study with 80 German high school students in a between-subjects design comprised of two conditions: (a) training intervention on knowledge integration, (b) no such training intervention. We will assess learning outcomes, such as domain-general knowledge (i.e., knowledge about principles of the knowledge integration approach) and domain-specific knowledge (i.e., knowledge about the physical principles). Furthermore, we will assess self-explanation quality to gain insights into learning processes during the training interventions and to analyze the possible mediating effect of self-explanation quality on learning outcomes. Expecting positive effects of our training intervention on learning outcomes, we might show the potential of a short-term training intervention on knowledge integration. This could be a first promising step in developing more long-term and blended-learning interventions.

A comparative study on learning and teaching online inquiry skills in Finland and Chile

Keywords: Attitudes and beliefs, Comprehension of text and graphics, Self-efficacy, Survey Research

Presenting Author: Eero Sormunen, University of Tampere, Finland; **Presenting Author:** Mirjamaija Mikkilä-Erdmann, University of Turku, Finland; **Co-Author:** Teemu Mikkonen, University of Tampere, Finland; **Co-Author:** Norbert Erdmann, University of Turku, Finland; **Co-Author:** Carita Kiili, University of Oslo, Norway; **Co-Author:** Elina Hämäläinen, University of Jyväskylä, Finland; **Co-Author:** Mario Quintanilla, Universidad Católica de Chile, Chile; **Co-Author:** Roberto González-Ibáñez, Universidad de Santiago, Chile; **Co-Author:** Paavo Leppänen, University of Jyväskylä, Finland; **Co-Author:** Marja

Vauras, University of Turku, Finland

The poster presentation will report the findings of a survey study on teachers and students in Chile and Finland. The survey is a part of a cross-cultural project aiming to develop novel pedagogical practices in teaching online inquiry competences in primary schools. The survey explores students' epistemic and learning beliefs, attitudes to online inquiry, and their perceived self-efficacy on online inquiry skills. The teachers' survey covers the same constructs and, in addition, their teaching beliefs, and perceived self-efficacy on teaching online inquiry skills. The study is expected to shed light on the primary school students' and teachers' aptitudes to adopt pedagogical practices needed in the Internet-dominated information and media environment. Further, the study will demonstrate the differences in the actors' fundamental conceptions of knowledge, learning and teaching in two school systems and cultures. The poster will also discuss the methodological challenges in cross-cultural research in education.

Learning science - does e-text design matter?

Keywords: E-learning / Online learning, Higher education, Learning Technologies, Teaching / instruction

Presenting Author:Norbert Erdmann, University of Turku, Finland; **Presenting Author:**Mirjamaija Mikkilä-Erdmann, University of Turku, Finland; **Co-Author:**Eero Laakkonen, University of Turku, Finland

The purpose of this study is to investigate, how e-text influences science learning of preservice teacher students and what students expect from new e-text design. Two different e-text designs (index and concept map) for iPad were tested with 189 university students. Pre- and post-test design was used. Both groups increased statistically significantly their performance. However, there were no statistically significant interaction effects found between treatment groups. Students' expectations for e-text design seem to be very traditional. Students preferred traditional characteristics in e-text design such as underlining and making notes more than interactive characteristics such as links leading to additional materials, videos and games.

Students' task solving times and task solving efficiency on an online language skills test

Keywords: Assessment methods and tools, Computer-assisted learning, Quantitative methods, Student learning

Presenting Author:Tibor Vidákovich, University of Szeged, Hungary; **Co-Author:**Olga S. Hrebik, University of Szeged, Hungary; **Co-Author:**Tibor Vigh, University of Szeged, Hungary

This research investigated online task solving of primary school students. The aim was to analyse student achievements and task solving times on a universal (not language-specific) language skills test, and to explore the effect of task's cognitive level and task's position on task solving time and on task solving efficiency. The test consisted of four subtests with different cognitive levels. Data were collected in two primary schools, the sample comprised 6–7th grade students. The online assessment platform stored item responses and task solving times. An indicator of students' 'task solving efficiency' was computed for each task, expressing the relation of these factors. The test proved to be of acceptable reliability. Significant differences were found between the subtests in achievements and in test taking times as well, but the differences were independent from the cognitive level. Significant correlations were found between test taking time and test score for the whole test, and for two subtests. Our results verified the effect of the cognitive level of the subtest on students' task solving efficiency. Students proved to be more efficient on subtests of low cognitive level, and less efficient on subtests of high cognitive level. On three subtests, students' task solving efficiency was significantly lower on the first task than on the following ones. Finally, the higher was the cognitive level of the subtest, the stronger was the correlation between test taking time and test score. Successful task solvers tend to spend more time on tasks of high cognitive level.

Development of early mathematical cognition using app. An empirical study

Keywords: Early childhood education, Learning disabilities, Numeracy, Technology

Presenting Author:Jose I. Navarro-Guzman, University of Cadiz, Spain; **Co-Author:**Gonzalo Ruiz Cagigas, Universidad de Cádiz, Spain; **Co-Author:**Manuel Aguilar-Villagrán, University of Cadiz, Spain; **Co-Author:**Estívaliz Aragón-Mendizabal, University of Cadiz, Spain; **Co-Author:**M. Carmen Canto, University of Cadiz, Spain; **Co-Author:**Candida Delgado-Casas, University of Cadiz, Spain; **Co-Author:**Esperanza Marchena-Consejero, University of Cadiz, Spain; **Co-Author:**Inmaculada Menacho, University of Cadiz, Spain; **Co-Author:**Manuel García-Sedeño, University of Cadiz, Spain; **Co-Author:**Pedro Ramiro, University of Cadiz, Spain

There is unanimity that early identification of poor performance in learning, and relevant intervention could reduce subsequent failure in math. There are also evidence that intervention must address both aspects of "general domain" (working memory, processing speed), and those of "specific domain" (Subitizing, Composing and Decomposing Numbers, Number Line). In this regard, our project aims to implement these knowledge advances about early mathematics learning via widely used technologies by children. The project's overall objective is reducing rates of learning difficulties in mathematics at early age. This is identified in other more specific goals: (1) Design and construction of mobile devices applications (APP) tasks based on "general domain" and "specific domain" for early mathematical learning. (2) Check APP validity as educational tools with 5-7 y.o. students in order transferring contrasted knowledge to public and private educational settings. (3) Expand an innovative line of research examining the effectiveness of APP, through a continuous tutoring of students in several schools. The educative intervention is based on innovation strategies in the context of e-learning. Previous R & D projects developed by us have consolidated the cognitive features involved in learning mathematics. The project involves a collaboration between researchers and teachers to the design, implementation, supervision and monitoring. This proposal will be carried out a 3-years longitudinal study, with 2 groups (control and

experimental). Participants are evaluated before, during and after educational intervention, using e-assessment procedures. The expected results are e-learning should improve math skills.

Merging academic and LMS data for first year engineering and education students at two universities

Keywords: E-learning / Online learning, Higher education, Learning analytics, Student learning

Presenting Author: Carlos González-Ugalde, Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Sergio Celis, Escuela de Ingeniería y Ciencias. FCFM. Universidad de Chile, Chile; **Co-Author:** Dany López, Facultad de Educación. Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Sergio Barrera, Escuela de Ingeniería y Ciencias. FCFM. Universidad de Chile, Chile; **Co-Author:** Augusto Sandoval, Facultad de Ingeniería. Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Maximiliano Montenegro, Facultad de Educación. Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Carolina Guzmán-Valenzuela, University of Chile, Chile

In this poster we characterize, compare, and contrast academic and learning management system (LMS) data from first year students enrolled in a School of Engineering and in a School of Education. Both schools, each of which belongs to a different research university in Chile, have constructed statistical models for understanding and predicting academic achievement. In this study, we expand those models with new sources of data and merge both school records. Thus, this study contributes several dimensions to our knowledge about learning analytics and academic performance. First, the study combines detailed academic records and different types of LMS operations in relation to first year courses. Second, since these data are collected at two types of institutions and from two professional disciplines, we are able to test how conceptual and statistical models behave across different but comparable learning environments. Finally, the poster will include key lessons obtained from merging sensitive data from multiple sources. In total, the data for this poster consists of 1,978 students from the 2013 and 2014 entry cohorts at both schools.

Students' expectations to and experiences of research based teaching

Keywords: Higher education, Learning approaches, Science education, Student learning

Presenting Author: Camilla Østerberg Rump, University of Copenhagen, Denmark; **Co-Author:** Dorte Christiansen Elmeskov, Department of Science Education, University of Copenhagen, Denmark

Teaching and learning are often competing activities, and this leads to frustrations and may compromise the quality of teaching. As part of a university wide initiative, three modules were redesigned to engage students in research or research-like activities. In order to evaluate this, we developed an instrument asking students about their *expectations* to research-based teaching. This instrument can be administered pre and post instruction. The idea is, that is that we would expect an increase in students' expectations to research-based teaching if they have a good experience. The instrument is based on Healey's model (2005) of four types of research-based teaching. It was administered pre and post instruction to three classes in landscape architecture and biochemistry. Results show that for biochemistry the students' expectations do indeed rise. For landscape architecture they do, however, decline. This can be explained by the students experiencing too little outcome in relation to time spent. A redesign has been made, and results from this will be reported. In our judgement, the instrument provided valuable input to the evaluation of the modules involved. A factor analysis identified four factors. We would have expected them to be close to the four types of factors in Healey's model. The factors were far from. Rather it seems that the students distinguish "ordinary teaching" from other types of teaching. We find that this is a quite striking result.

Where is the future? Identifying trends in educational technology using big data methodology

Keywords: E-learning / Online learning, Educational Technology, Higher education, Technology

Presenting Author: Maren Luebcke, Zurich University of Applied Sciences, Switzerland; **Co-Author:** Wilfried Seifert, Softwareentwicklung Seifert, Switzerland

Digital technologies are one of the key drivers of change identified by Ernst & Young (2012) in their study on the university of the future. In the field of educational technology new forms, trends, and hypes arise. Universities have to decide which short and medium and long-term developments must be addressed and adapted and which can be ignored.

We present a new methodology to identify educational technologies that become relevant for universities in 3 to 5 years.

The method is based on a meta-analysis of different discourse spaces, each discourse space representing a different part in the Gartner Hype Cycle. For 2016 the results of eight different trend reports, 1'416 scientific articles from the field of educational technology and 1,000 tweets were systematically analyzed. On a medium time perspective (5 years) the following technologies become relevant:

Bots / Robots/Affective Computing / AIAlgorithmVirtual Reality / Augmented RealityWearables

On a short time perspective (2 years) we can find the following trends:Mobile devicesGamesMOOCAAt EARLI 2017 these results from 2016 will be compared with results of the 2017 analysis .

How can Question Generation be implemented in the University Curriculum?

Keywords: Cooperative / collaborative learning, Experimental studies, Higher education, Student learning

Presenting Author:Roman Abel, University of Kassel, Germany; **Co-Author:**Matthias Mai, University of Goettingen, Germany

Generating questions is known as a solid learning strategy in order to enhance learning outcomes (Foos, Mora, & Tkacz, 1994; Rosenshine, Meister, & Chapman, 1996; Bugg & McDaniel, 2012). This method was already applied in early and recent field experiments on university courses' topics (Foos et al., 1994; Levin & Arnold, 2008) but never as an assignment for a course credit. In our study 87 students participated over four equal courses about Educational Psychology. They have been randomly distributed between ten timeslots with different topics and between three types of assignment for a course credit. Two control groups were conducted: 1. writing a report as an alternative elaborative strategy and 2. preparing and holding a presentation about a related, but not a relevant topic in the current timeslot. The final retrieval test contained a pool of items from each timeslot in order to differentiate topic related and topic non-related items. The main question of this study is whether the learning strategy generating questions leads to gains in learning performance regarding the targeted items. The study did not only reveal main differences between groups concerning the targeted items but also of topic irrelevant items. The type of assignment seemed to influence the degree of elaboration in the own as well as in other timeslots. In fact we could not confirm our hypothesis – not generating questions but writing a report revealed to be the favorable learning strategy.

Encountering Students in Disabling Conditions in Higher Education

Keywords: Higher education, Qualitative methods, Student learning, Teacher Professional Development

Presenting Author:Lotta Anderson, Malmö University, Sweden; **Presenting Author:**Lisbeth Ohlsson, Malmö University, Sweden; **Co-Author:**Camilla Nordgren, Malmö University, Sweden

The aim of this paper is to discuss challenges for staff in Higher Education encountering students in disabling conditions. The study takes a point of departure in a series of workshops to strengthen the competence among staff at Malmö University to develop inclusive learning environments in their field of responsibility. The research questions concern the participants' understanding of what constitutes an inclusive learning environment and their preparedness for acting in line with rights for people with disabilities to an education free from discrimination. Content analysis from field notes taken in dialogues with the participants showed that barriers exist e.g. due to procedures in order to get a statement qualifying to support as well as not having a statement meaning that the student becomes carrier of her/his own problems, responsible for telling each staff member about the disabling conditions and needs. Tension appeared in the analysis between giving support to the individual student and a proactive problem solving in a flexible learning environment to the benefit of all students. Principles of equal access and widened participation are not easily applied leading to the conclusions that further efforts need to be made to disseminate existing knowledge in the field and moreover to identify knowledge gaps by involving students, coordinators of support and other staff in different survey studies. The framework for coming studies is anchored in theory and practice developed in Universal Design for Learning focusing staff development and students' sense of belonging when facing disabling conditions in higher education.

Assessment Preferences and Approaches to Learning of MBA and MPA students: A Comparative Study

Keywords: Assessment methods and tools, Educational attainment, Higher education, Student learning

Presenting Author:James Kwan, Lancaster University, Singapore

This pilot study seeks to examine the educational goals, learning approach, and assessment preferences among the part-time MBA and MPA students in Singapore. The quantitative study uses a questionnaire that employed the revised two-factor study process questionnaire (R-SPQ-2F) to identify students approach to learning, and the adapted Assessment Preference Inventory (API) to examine students' preferences to different assessment types/tasks.

The results of this study showed that educational goals relating to career advancement/enhancement and improved knowledge and skills were the key motivational factors that lead students pursuing postgraduate studies. When comes to approaches to learning, students generally adopting a deep learning approach, especially among the MPA students and the older students. This approach to learning was also evident in the assessment preference among the respondents, where they preferred assessments that required higher order level of thinking. When comes to the assessment types,

respondents have strong preference for individual assignment and showed least preference for exam. However, there was no significant difference in the preference for any of the assessment items/format among gender and age groups. The findings in this study will be beneficial for the university to consider to redesign the curriculum for both programs to suit the needs of existing students as well as to increase its appeal to prospective students. The respondents' views on their learning approach and assessment preferences will allow instructors and module leaders to relook into the teaching pedagogy and current assessment structure in order to improve students' learning experience.

To tweet or not to tweet?! Can using Twitter improve learning and instruction in higher education?

Keywords: Educational Technology, Higher education, Informal learning, Teaching / instruction

Presenting Author: Britt Adams, Ghent University, Belgium; **Co-Author:** Annelies Raes, Ghent University, Belgium; **Co-Author:** Hannelore Montrieux, Ghent University, Belgium; **Co-Author:** Elise Ameloot, Ghent University, Belgium; **Co-Author:** Tammy Schellens, Ghent University, Belgium

Of the range of recent technological developments, social media have become the most widely adopted by the current generation of students. However, despite the widespread use and the potential of social media to enhance learning and instruction in higher education, research on students' actual user experiences is still lacking. This paper describes two consecutive interventions in which two comparable student populations were assigned (to start) using Twitter in the context of a Third Academic Bachelor Course Instructional Strategies. The first intervention was conducted from September '15 till January '16, the second intervention has just started in September '16. Based on the results of the first intervention, we could conclude that our students were rather skeptical about using Twitter in higher education, although they had moderate to high initial expectations. One of the critical obstacles students put forth was competence frustration, overload, and external motivation. These results led to concrete suggestions for future practice which are taken into account in the second intervention. We are looking forward to present the results of both interventions at a round table session, and discuss with the participants the opportunities and conditions for using Twitter - and social media in general - in higher education.

Improving integration skills for argumentative writing: a pilot intervention in an online university

Keywords: Argumentation, E-learning / Online learning, Higher education, Writing / Literacy

Presenting Author: Maria Luna, Universidad a Distancia de Madrid (UDIMA), Spain; **Co-Author:** Ruth Villalon, University of Cantabria, Spain; **Co-Author:** Mar Mateos, Universidad Autónoma de Madrid, Spain; **Co-Author:** Elena Martin, Universidad Autónoma de Madrid, Spain

Effective argumentation in written tasks is a demanding task for secondary and university students. It involves understanding, evaluating, weighing, combining and generating arguments and counterarguments from different sources and perspectives to support a final position. Despite its difficulty and complexity, argumentative writing is scarcely taught at the Spanish university, so students need, in particular, more instruction to improve their argumentative skills. This pilot study is aimed to design and test instructional assistance supported by Moodle platform in an online university. Volunteer undergraduates participated in this pre-post design. They were asked to write a previous synthesis from two source texts and to attend to two types of instructional virtual environment ("traditional" / "metacognitive") in order to write a second synthesis from two new texts. In this paper we present data of thirty-four students who receive the "metacognitive" instruction, which focus on the reading and writing processes of written argumentation. This intervention includes explicit instruction, a modelling video and a script to guide the reading and writing processes. It employs several resources such as videos, graphic organizers and exercises. Results show that, after the training, the written products which reached at least a minimum integration were more frequent. However, the products that presented medium and maximum integration were still limited. This results suggest that students still need more training and support in order to expand their skills for generating new integrative arguments.

Chairperson: Thomas Moser, University College of Southeast Norway, Norway

Addressing the quality of doctoral supervisors

Keywords: Doctoral education, Educational policy, Qualitative methods, Researcher education

Presenting Author: Margaret Kiley, Australian National University, Australia

Research suggests that a supportive advising [supervising] relationship is central to successful and timely completion and particularly as an agent for socialization into the discipline the institution and a scholarly approach to research (Gardner, 2010; Golde, 2000). Furthermore, as Lovitts and Nelson (2000 p. 49) report: "The data suggest that the single most important factor in student decisions to continue or withdraw is the relationship with a faculty adviser". However, anecdotally it is not uncommon to hear Heads of Department, Deans of Faculty and those in similar positions say that they know who the poorly performing doctoral supervisors are, but often they are not sure what they can do to remedy the situation. This study interviewed 36 senior staff in order to understand how they identified supervisors who were generally considered less than ideal in the way they supervised doctoral candidates and then how they addressed this issue. The results provide helpful insights for staff in leadership positions as well as those whose role it is to support doctoral education, and particularly supervision.

What is the value of a doctoral degree? Perceptions of doctoral value in the UK knowledge economy

Keywords: Doctoral education, Higher education, Mixed-method research, Researcher education

Presenting Author: Billy Bryan, University of Sheffield, United Kingdom; **Co-Author:** Kay Guccione, University of Sheffield, United Kingdom

Those who have a doctorate are said to hold significant knowledge and social capital. The recruitment of doctoral graduates yields collective knowledge, skills, networking, and prestige benefits to organisations, and to UK industries. As individuals though, do graduates experience net gain from the doctoral process, and how do they perceive the value that engaging with doctoral study confers? This study used a mixed methods approach to collect survey data from current doctoral students (n=195) and interview data from recent doctorate holders (n=24). The main finding was that the doctorate was perceived not to be as valuable as both groups had expected, but gained other 'added-value' from the process. Doctoral students and graduates across disciplines and careers find most value in the personal resilience and resourcefulness they develop through study, as well as deriving useful and translatable learning from inter-personal, cultural awareness, and relational processes. Student's value judgements were affected by factors such as supervision and their level of progress in the doctoral process. Graduate's perceptions were chiefly affected by their progress on the career ladder and their financial position. These findings have the potential to inform doctoral education programme leaders and HE policy makers in not only how to squeeze value from doctoral graduates, but to create a positive doctoral experience with lifelong benefits to the individual.

Doctoral Students' Writing Regulation Processes

Keywords: Doctoral education, Researcher education, Self-regulation, Writing / Literacy

Presenting Author: Anna Sala-Bubaré, Ramon Llull University, Spain; **Co-Author:** Montserrat Castelló, Ramon Llull University, Spain; **Co-Author:** Gert Rijlaarsdam, University of Amsterdam, Netherlands

Academic writing is a complex cognitive and sociocultural activity that requires writers to regulate their actions at different levels and phases. Doctoral education research shows students face many challenges along the writing process. However, little is known about how PhD students regulate their on-line writing process. To address this gap, the present study analysed two doctoral students' regulation processes when starting to write their first scientific article. Participants wrote an extended abstract of their research under naturalistic conditions. A screen-recorder and a keystroke logging software were used to collect data, along with a short writing log and responded to an open-ended questionnaire. After a week, writers received feedback on their texts and revised their abstracts under the same conditions. The analysis involved three levels: 'operations' (each keystroke or mouse movement), 'actions' (consecutive operations sharing a specific goal), and 'episodes' (actions aimed at the same objective). Based on the unit of analysis 'Regulation Episodes', 'episodes' were classified as 'regulation' and 'production', and "regulation episodes" were further characterised in relation to their type, focus and location. Results showed writing a scientific article is a 'writing-from-sources' activity right from the beginning of the process. Great variations not only between the two writers, but also between sessions regarding the type and distribution of the problems addressed, the regulation episodes and the attempted solutions. This study provides an innovative method to explore regulation processes of authentic tasks.

Students' identity formation processes and academic achievement at their university

Keywords: Achievement, Developmental processes, Emotion and affect, Higher education

Presenting Author: Hanke Korpershoek, University of Groningen, Netherlands

The objective of this paper was to demonstrate the construct validity and predictive validity of the measurement framework presented by Crocetti, Rubini, and Meeus (2008), which was originally developed to measure the identity formation processes (such as achieving commitments) of individuals in various domains. An adapted version of the Utrecht-Management of Identity Commitments Scale (U-MICS) was used to measure university students' identity formation processes, which are a part of students' personal identities, at their university. The U-MICS seeks to measure three dimensions of identity formation: commitment, in-depth exploration, and reconsideration of commitment. A Rasch measurement approach was applied. The results showed that the multidimensional model validly represented students' identity formation processes at university (construct validity), although some items need further improvement. Suggestions for improvement are discussed. The commitment and in-depth exploration scales were positively related to students' academic achievement, while the reconsideration of commitment scale was negatively related to the same (predictive validity).

Mapping pedagogic frailty in science education: a comparison of academics' espoused values

Keywords: Attitudes and beliefs, Higher education, Science education, Teacher Professional Development

Presenting Author: Paulo Correia, University of Sao Paulo, Brazil; **Co-Author:** Joana Aguiar, University of Sao Paulo, Brazil; **Co-Author:** Ian Kinchin, University of Surrey, United Kingdom

Pedagogic frailty is explored as a unifying concept to integrate institutional efforts to enhance university teaching. One of the underlying causes of pedagogic frailty may be the way in which the curriculum discourses surrounding the instructional mechanisms of teaching seem to take precedence over the discourse of the underpinning values. This key dimension of frailty (regulative vs. instructional discourse) and the links that connect its parts are interrogated here through the analysis of contrasting concept maps produced by two academics experienced in the teaching and research of science education. The findings from this study reveal the subjective nature of teaching and provide a glimpse of the idiosyncratic nature of the values that underpin academic identity. The methodology described suggests a way forward to the development of bespoke, person-centred and discipline-sensitive faculty development by providing deep self-reflect as the process of teaching. Moreover, the data collected can be used to promote dialogue about quality enhancement in science teaching and the development of the idea of institutional values literacy.

Study profiles in different disciplines and their relation to study success and self-efficacy

Keywords: Higher education, Learning approaches, Self-efficacy, Survey Research

Presenting Author: Anna Parpala, University of Helsinki, Finland; **Co-Author:** Telle Hailikari, University of Helsinki, Finland

There is still little evidence on the disciplinary differences in students' approaches to learning as only a few studies have included students from various disciplines. The present study aims to examine what kind of combinations of approaches to learning emerge in different disciplines and how profiles, based on those combinations, are related to study success and self-efficacy beliefs. All together 4377 university students from six different disciplines participated in the study. The results showed that the most successful profile is the combination of deep and organised approach to studying whereas the combinations of deep and unorganised studying and incoherent study profile seem to be the most problematic in the light of self-efficacy and study success. The study highlights the need to take disciplinary differences and study profiles into account to enhance teaching and learning.

Improving University Courses by Fostering Students' Learning Strategies

Keywords: Action research, Design based research, Higher education, Teaching approaches

Presenting Author: Alexander Renkl, University of Freiburg, Germany; **Co-Author:** Tino Endres, University of Freiburg, Germany; **Co-Author:** Jasmin Leber, University of Freiburg, Germany

The Scholarship of Teaching and Learning can be thought of in two different ways. The traditional way is teaching orientated. This way is to optimize university seminars by improving the teacher's instruction. A complementary way is to foster students' learning strategies to learn more from teacher's instruction. For the latter purpose, we have developed a computer-based learning environment for freshmen students in a developmental psychology course. This environment consists of two modules: 1) teaching declarative knowledge about learning strategies and 2) supporting students to apply these learning strategies when working for the university course. We conducted several experimental studies to optimize this learning environment with respect to how motivating it is, how the declarative knowledge about learning strategies can

be effectively consolidated, and how the formation of prompts for applying the learning strategies can be sensibly supported. We found that motivation while working with the learning environment can be fostered by using sketched explanation videos used as advance organizers. For consolidating students' knowledge about learning strategies, a retrieval practice-based arrangement is best that uses different types of test questions for learners with different prior knowledge levels. This prior knowledge is automatically assessed in the learning environment. Finally, we found that it is important to guide the students to form very specific prompts for applying learning strategies.

Lifelong Learning, Motivational, Social and Affective Processes

Self-regulation and Motivation

Keywords: Achievement, At-risk students, Developmental processes, Educational attainment, Mathematics, Metacognition, Motivation, Motivation and emotion, Quasi-experimental research, Self-efficacy, Self-regulation, Student learning

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Norbert Erdmann, University of Turku, Finland

Perception of Mindfulness Practice and its Contribution to Students Wellbeing

Keywords: Developmental processes, Educational attainment, Self-efficacy, Motivation and emotion

Presenting Author: Ariela Teichman-Weinberg, Achva Academic College, Israel; **Co-Author:** Ilana Rachmilewitz, Achva Academic College, Israel; **Co-Author:** Esther Grobgeld, Achva Academic College, Israel

Mindfulness meditation is intended to develop attention to an experience that is taking place in the present, with non-judgmental acceptance. The present study examined the experience of fifth and sixth graders who practice mindfulness and how this experience contributed to their wellbeing. Most of the interviewed students reported practicing mindfulness also in their free time, in order to cope with anger, pressure and stress. They experience of the practice as calming, improving the concentration ability. In the education system, mindfulness practice can comprise an effective, available and applicable solution which contributes to the students' positive feelings, by finding a quiet place in their minds.

Enhancing adolescents' self-determined motivation and self-concept in math. An intervention study.

Keywords: At-risk students, Mathematics, Motivation, Quasi-experimental research

Presenting Author: Claudia Cristina Brandenberger, University of Bern, Switzerland; **Co-Author:** Gerda Hagenauer, University of Bern, Switzerland; **Co-Author:** Tina Hascher, University of Bern, Switzerland

A negative trend, especially for students in lower achievement levels, is for academic self-determined motivation to significantly decline across childhood through adolescence, and more so in math than in any other school subject. To counteract this negative development, an intervention study based on the Self-Determination Theory was developed and implemented in seventh-grade math classes with basic demands in Switzerland. The study applied a quasi-experimental design using two treatment groups (combined student/teacher group: teachers and students participate in intervention; students-only treatment group: only students participate in intervention) and a control group. The sample for this study included 348 7th grade students (student/teacher group: 134 students; students-only group: 122 students; control group: 92 students). The aim of this study was to examine the impact of both treatment forms on students' motivation and self-concept. The intervention was evaluated longitudinally (pre- and post-test) through a student questionnaire. Paired sample t-tests and Cohen's d showed that the most positive effects were found for students in the combined group with a significant increase in intrinsic motivation and self-concept. Multivariate analysis of covariance with repeated measures revealed a significant intervention interaction effect for intrinsic and identified motivation as well as self-concept, indicating significant differences between the groups in favour of students in the combined group. The results of the present study highlight that the decline of autonomous motivation across adolescence is strongly influenced by teachers who shape the learning environment *and* by the students who develop learning competencies and reflect on their attitudes towards learning.

Parents' autonomous motivation favours students' motivation toward homework

Keywords: Achievement, Self-efficacy, Self-regulation, Motivation and emotion

Presenting Author: Angelica Moè, University of Padova, Italy; **Co-Author:** Idit Katz, Ben-Gurion University of the Negev, Israel; **Co-Author:** Marianna Alesi, Università di Palermo, Italy

Although homework is a frequent source of stress for both parents and students, parents' autonomous motivation and display of positive affect can make the difference. In this research, we tested the hypothesis that parents' autonomous motivation favours students' motivation and display of positive affect during homework. Study 1 used a correlational approach and showed, with 205 dyads of parents and their children from the fourth to eighth grades, that parents' autonomous motivation favours parents' positive affect, which in turn is associated with students' positive and negative affect, both directly and through the mediation of students' self-efficacy. Study 2 assessed the effectiveness of an intervention, with parents focused on practising autonomous supportive modalities on students' homework motivations and

affect. The results showed that the training reduced parents' controlled motivation and negative affect, and prevented a decrease in students' autonomous motivation and engagement. The discussion focuses on theoretical and educational implications.

Predictors of self-regulated learning in upper secondary and higher education

Keywords: Metacognition, Motivation, Self-regulation, Student learning

Presenting Author: Christian Brandmo, University of Oslo, Norway; **Co-Author:** Olav Schewe, University of Oslo, Norway

The current study examines how different individual and social components of motivation predict various aspects of self-regulated learning and whether these potential predictions are valid across levels of education. The participants comprised 1,588 upper secondary school students and 981 higher education students from Norway, totaling 2,569 students. The data were collected through an informative web-solution that gave the participants immediate feedback on their component scores compared to a norm. The data were analyzed by means of factor analyses and structural equation modelling. Using a tree-factor model of self-regulated learning – planning and monitoring, volition and resistance for distraction, and adaptive regulation for learning – the results revealed that the different types of motivation variously predicted the components of self-regulated learning. Though there were similarities in the prediction pattern across educational levels, significant differences were also found. Implications for further research as well as practical implications are discussed.

Reflective Assessment in Computer-Supported Collaborative Learning for Pre-Service Teachers

Keywords: Assessment methods and tools, Attitudes and beliefs, Computer-supported collaborative learning, Educational Psychology

Presenting Author: Carol Chan, The University of Hong Kong, Hong Kong; **Co-Author:** Wincy Lee, Education University of Hong Kong, Hong Kong; **Co-Author:** Rhoda Wang, The University of Hong Kong, Hong Kong

This study examined the design of a computer-supported environment using online discussion for alignment of learning, collaboration and assessment. Participants were 155 student teachers attending a course in psychology of classroom learning in a teacher education program in Hong Kong. The design included students contributing to online forum; engaging in regular discussion; and reflecting on their discourse. For reflective assessment, student teachers identified three best examples (clusters of notes) from the class community's discourse and explained why they were important for their inquiry. Data consisted of questionnaires on epistemic beliefs and collaboration; students' postings on online forum; reflective assessment notes (3 best clusters of notes); and end-of-term theory-practice summary paper. Correlation analysis show that students' beliefs about collaboration was related to their beliefs about knowledge (development); as well, regression analysis indicate that reflective assessment scores significantly predict summary paper (domain understanding). Implications of examining both individual and community learning through reflective assessment in computer-supported environments are discussed. _

Influencing policy makers and institutional leaders in Finnish Arts Education via systems thinking

Keywords: Arts, Conceptual change, Educational policy, Reflective society

Presenting Author: Tuulikki Laes, Sibelius Academy of the University of the Arts Helsinki, Finland; **Co-Author:** Lauri Väkevää, Sibelius Academy of the University of Arts Helsinki, Finland; **Co-Author:** Hanna Kamensky, Sibelius Academy of the University of Arts Helsinki, Finland; **Co-Author:** Sanna Kivijärvi, Sibelius Academy of the University of Arts Helsinki, Finland; **Co-Author:** Kati Nieminen, Sibelius Academy of the University of Arts Helsinki, Finland

In this round table discussion we examine how systems thinking can be used in policy work and communication with institutional leaders. We ask, can systems thinking in the context of Basic Education in the Arts be a tool for conceptualizing social change and strengthening democratization in contemporary Finnish society? The participants of the discussion are involved in the ArtsEqual initiative (2015-2020) that reinterprets the traditional position of the arts in Finland by regarding them as a basic service that should be equally available for all. From the perspectives of equality and well-being, the project generates new knowledge on how already existing arts services could be developed in order to enhance the democratic and inclusive thinking and action in diverse society. The project will propose policy recommendations to support decision-making and to consolidate new arts and arts education based services. Through examples of three innovative case studies of the ArtsEqual, we will raise the question: how can systems thinking in the context of Basic

Education in the Arts (BEA) be a tool for strengthening the process of democratization in contemporary Finnish society?

The modelling of teachers' judgment in summative assessment practices

Keywords: Assessment methods and tools, Primary education, Qualitative methods, Teacher Effectiveness

Presenting Author: Lucie Mottier Lopez, University of Geneva, Switzerland; **Presenting Author:** Lionel Dechamboux, University of Geneva, Switzerland

Our research examines the construction of meaning during summative assessment practices with respect to predefined assessment criteria and other emerging referents. The purpose is to model the dynamic and logic of the teachers' judgment in practice, in particular in case of hesitations and when the teachers authorize them to make adjustments during grading-process. First, we use a conceptual framework developed in the French-speaking community of researchers in assessment in education, that takes into account the relation between assessment criteria (called "referents", components of assessment frame of reference) and observables or signs in the student's answer selected by the assessor (called "referes", Hadji, 1989). Processing of assessment reference is called "referentialization" (Figari & Remaud, 2014), for instance when new meaning of pre-defined assessment criteria emerged during grading process. Secondly, we interpret the phenomena of referentialization we observed with respect to a professional judgment perspective (Lafortune & Allal, 2008). Our results will show how pre-existent and emergent referents are differently located during the teachers' activity of referentialization, between interpretation and decision-making processes. The kind of triangulation between these referents seems to characterize different profiles of teacher-assessor. We will discuss these profiles, in particular according to the validity of consequence of the assessment.

Development of achievement and test taking behavior – a class-centered analysis

Keywords: Achievement, Assessment methods and tools, Motivation, Secondary data analysis

Presenting Author: Risto Hotulainen, University of Helsinki, Finland; **Co-Author:** Sirkku Kupiainen, University of Helsinki, Finland; **Co-Author:** Mari-Pauliina Vainikainen, University of Helsinki, Finland; **Co-Author:** Pirjo Lindfors, University of Tampere, Finland

In Finland, differences between schools have been one of the lowest in the OECD according to several PISA studies, but there is much less research on within-school effects in Finland, with only a few exceptions. These studies have shown that there are considerable class level differences on both school achievement and scientific reasoning. Aim of this study was to detect if development of class-level academic achievement from 7th to 9th grade between classes differ and if yes, the second aim was study if there are between class-level differences in motivation and social capital. Two theories provided ground for the chosen approach: Achievement goal orientation theory and the Theory of social capital including both classroom and family social capital. The final study population filling out the questionnaires and achievement tests (math and reading) in 2011 (7th grade) and 2014 (9th grade) contained 5219 students (51.3% girls) from 462 classrooms and 117 schools. Latent profile analysis and ANOVAs were executed with aggregated class level data. The results showed that based on repeated achievement measures, it was possible to find three class achievement profiles: P1: increasing (69 %), P2: moderate (19 %) and P3: decreasing (13 %). Class profiles differentiated both in motivation and social capital (both classroom and family social capital). This study showed that the development of low-stake test achievement and behavior is associated with class level goal orientations and social capital.

Relationship between scientific and inductive reasoning in grades 5 and 7

Keywords: Cognitive development, Quantitative methods, Reasoning, Science education

Presenting Author: Erzsébet Korom, University of Szeged, MTA-SZTE Science Education Research Group, Hungary; **Co-Author:** Mária B. Németh, MTA-SZTE Research Group on the Development of Competencies, Hungary; **Co-Author:** Attila Pásztor, MTA-SZTE Research Group on the Development of Competencies, Hungary; **Co-Author:** Benő Csapó, University of Szeged, Hungary

This study reports the first results of a project, which investigates the relationship between general thinking skills, scientific reasoning and motivation to learn sciences. The purpose of this paper is (1) to examine the development of general thinking skills and scientific reasoning between grades 5 and 7, and (2) to explore the relationship between inductive and

scientific reasoning. The sample included 53-53 classes from 52 Hungarian schools (grade 5: N= 549, males 49.9%, grade 7 (N=551, males 47.7%). An online test was developed to assess scientific reasoning (Cronbach's alpha grade 5: .76; grade 7: .84). In order to complete the tasks students had to operate different thinking processes such as conservation; proportional, correlational, probabilistic reasoning and classification skills in science context. The domain-general online inductive reasoning test comprised 55 items with four subtests: 15 figural series, 15 figural analogies, 14 number series and 11 number analogies (Cronbach's alpha was .90 in both grades). Results indicate that students' scientific reasoning skill changed significantly between the two school years. The correlation between scientific reasoning and domain general inductive reasoning was stronger in grade 7 ($r_{\text{grade5}}=.40$, $r_{\text{grade7}}=.62$). Linear regression analyses showed that inductive reasoning explained 39.7% of variance in grade 7 and 16.3% of variance in grade 5. Our results highlight the importance of improving reasoning through the content of teaching in everyday school practice.

Online assessment of scientific reasoning and motivation to learn science: a pilot study in Namibia

Keywords: Motivation, Quantitative methods, Reasoning, Science education

Presenting Author:Linus Kambeyo, University of Szeged, Hungary; **Co-Author:**Attila Pásztor, MTA-SZTE Research Group on the Development of Competencies, Hungary; **Co-Author:**Erzsébet Korom, University of Szeged, MTA-SZTE Science Education Research Group, Hungary; **Co-Author:**Mária B. Németh, MTA-SZTE Research Group on the Development of Competencies, Hungary; **Co-Author:**Benő Csapó, University of Szeged, Hungary

Abstract The purposes of this study were to explore the possibilities of online assessment and to investigate the relationship between scientific reasoning and motivation to learn science in Namibia. The sample of the study was drawn from the fifth (N=275) and seventh graders (N=346). The online assessment tool for scientific reasoning skills consisted of 36 items with 16 tasks assessing conservation; proportional, correlational, probabilistic reasoning and classification skills in science context. The Science Motivation Questionnaire II. (SMQ, Glynn et al., 2011) was also applied. The eDia platform was used to collect the data. Learners were ferried from their schools to the University of Namibia's ICT rooms. Due to the low reliability in grade 5 (Cronbach alpha=.64) we excluded them from further analyses. For grade 7 Cronbach alpha=.70. The tasks were moderately hard for the students: $M=40.56\%$; $SD=13.47\%$. One-parameter Rasch analyses showed that there were few items for differentiate students at low skill levels. The reliability of the SMQ was good, Cronbach alpha=.91. Average scores were relatively high, thus, students reported that they are motivated to learn science. Except self-efficacy significant (p

Linking Instruction and Student Achievement to Reading in English as a Second Language

Keywords: Language (Foreign and second), Reading comprehension, Teaching / instruction, Video analysis

Presenting Author:Lisbeth M Brevik, University of Oslo, Norway

This study follows teachers and students in seven classrooms at seven different schools across three school years, by identifying components of classroom practices that can be related to reading achievement. The study combines achievement data (national English reading tests), instructional data (video observations from English lessons), and student survey data (perceptions of their English instruction). The findings indicate low quality English instruction; evidence of implicit rather than explicit reading strategy use and instruction; and that while the majority of the students expressed satisfaction of the support they received in their English lessons, the observed support was primarily given in the first language aimed at the poor readers. This study contributes with systematic findings of what characterizes second language reading instruction.

Effects and Surprises of Teaching Biology in a Foreign Language

Keywords: Bilingual education, Language (Foreign and second), Motivation, Science education

Presenting Author:Pablo Pirnay-Dummer, Brandenburg Medical School Theodor-Fontane, Germany; **Co-Author:**Bonny Jänicke, Martin-Luther-Universität Halle-Wittenberg, Germany

Didactics often assume cognitive and motivational effects within properly conducted bilingual classroom settings for STEM-education, where a science is taught in a foreign language, which the students also learn at school. This quasi-experiment investigates commonly assumed effects on grades, grade change, motivation, interest and self-concept within a full-semester six point repeated measurement design with eight-graders (n=51). While none of the often-predicted effects on

motivation, interest and self-concept could be shown, this study presents promising cognitive effects on grades and performance within bilingual classrooms that are particularly beneficial for weaker learners: introducing the additional level of complexity of teaching to the class will not harm weaker students. They may instead benefit from such settings.

Motivational orientations, psychological needs and perceived autonomy support in teacher training

Keywords: Educational Psychology, Motivation, Pre-service teacher education, Teaching / instruction

Presenting Author: Daniela Martinek, University of Salzburg, Austria; **Co-Author:** Matteo Carmignola, University of Salzburg, Austria; **Co-Author:** Ulrike Kipman, Pädagogische Hochschule Salzburg, Austria; **Co-Author:** Julia Maria Keller, University of Salzburg, Austria

Being able to support their pupils' autonomy in class is an essential skill for teachers. Research results indicate that next to specific training programs individual orientations of students in teachers training need to be considered to enable future educators to reduce control and offer autonomy support in class. Our project focused on empirical evidence concerning the prerequisites of teacher trainees during their program at the university. Therefore 351 students participated in a questionnaire-based empirical study using the following scales: General Causality Orientations Scale (Deci & Ryan, 1985), Basic Psychological Need Satisfaction Scale (Van den Broeck et al. 2010) and Perceived Autonomy (based on Reeve et. al. 2003). In addition we manipulated the announcement of an existing educational course by offering one in controlling and one in non-controlling language. Data shows how students in teacher training differ in regard to the expressions of their causality orientations as they can be classified by distinct combinations of the three scales. Those profiles have an impact as high levels of autonomy orientation are linked to more valuable outcomes in the training program such as higher psychological need satisfaction and perceived autonomy. The experiment with two manipulated course descriptions brought the expected effect of verbal formulations on perceived autonomy as all students regardless their causality orientations showed higher levels of perceived autonomy for the formulation in autonomy supportive language. The results can contribute to design supportive didactical settings for teacher training offering students autonomy support and structure in a non-controlling way.

Prompting Preservice Teachers' Professional Vision for Self-Regulated Learning

Keywords: Pre-service teacher education, Self-regulation, Teacher Professional Development, Video analysis

Presenting Author: Tova Michalsky, Bar-Ilan University, Israel

The present study investigated the effects of three professional vision (PV) scaffolding level for analysing video-cases of complex self-regulated learning (SRL): (1) *Self-guided*, analysing video cases without any help, (2) *Hinted* approach, pre-service teachers got a time hint for the event they needed to analyse and (3) *Guided* approach, pre-service teachers got a popup notification of the relevant event and SRL teaching. Findings demonstrated that the *Hinted* approach led to better performance on pre-service teachers' use of SRL in their PV for SRL and actual SRL teaching as measured directly (implicit/explicit SRL-promoting strategy instruction), and indirectly (construction of SRL-promoting learning environments).

No Parents Left Behind! Enabling parental learning on a mobile phone app for working class families

Keywords: E-learning / Online learning, Peer interaction, Phenomenography, Lifelong learning

Presenting Author: Luis Go, The University of Hong Kong, Hong Kong; **Co-Author:** Ming Fai Pang, The University of Hong Kong, Hong Kong

It is found that text messaging were very effective in 'nudging' parents to participate in school activities and to get them more involved in their child's learning (EEF, 2014). However, as of today, mobile technology is still exceedingly under-utilized for the education of parents as parents. The paper presents the innovation of combining the case study methodology, publicly available video materials on parenting and WhatsApp mobile app to create a low cost, easy-to-use mobile app platform, thus making parent education more accessible to underprivileged working class families. With the help of administrators of schools located in relatively economically depressed areas of the city, 15 to 20 parents in each of the 3 participating schools were invited into a school WhatsApp mobile app peer-learning group. Five parenting situational videos were used as cases. Each case video was uploaded at the beginning of each lesson, and each case class discussion allotted five days. The group parent education moderator monitored the level of participation and ensured that the discussion stays on the case. Pre- and post- event interviews were conducted with the participants. Interview transcripts

were analysed to evaluate parental learning. Preliminary results indicate significant levels of transformational learning occurring amongst the participants.

Learning to see numbers as parts and wholes in preschool

Keywords: Early childhood education, Instructional design, Mathematics, Phenomenography

Presenting Author: Angelika Kullberg, University of Gothenburg, Sweden; **Co-Author:** Anna-Lena Ekdahl, Jönköping University, Sweden; **Co-Author:** Maria Reis, Göteborgs Universitet, Sweden

Children's understanding of early arithmetic plays a significant role in their potential for future learning of mathematics. It has been argued that one important part of children's understanding of the first ten numbers is a 'sensuous' experience of the numbers part-part-whole relationships. The aim of the research project, from which this study emanates, was to explore how the first ten numbers are experienced and early arithmetic is developed by 5-year old children. In the beginning of the project 103 participating children were interviewed individually. The intervention programme concentrated on games that focused e.g. on seeing part-part-whole relationships on fingers, and was implemented in close collaboration with the pre-school teachers. After the ten-month intervention period, the children were interviewed again. We report on findings from the analysis of one task in the video recorded interviews, 'the guessing game', using a variation theory framework. The aim of this paper is to illustrate identified differences found in children's experience of the part-part-whole relationship in the task before and after the intervention.

Learner contributions and sensitive teacher ears – Learning opportunities in mathematics instruction

Keywords: Qualitative methods, Teaching / instruction, Teaching approaches, Video analysis

Presenting Author: Tuula Maunula, University of Gothenburg, Sweden

Learner contributions and sensitive teacher ears – Learning opportunities in mathematics instruction The aim of this study is to identify teachers' responses to learner contributions in mathematics instruction and thereby to contribute to knowledge of what different responses mean to the emergence of learning opportunities. Variation theory is used to address learning opportunities in a content perspective (e.g. Marton, 2015). The empirical data encompasses 16 video recorded mathematics lessons. The lessons are either conducted in grade 9, 10 or 11 in Sweden. All lessons share the topic, *the introduction of linear equations*. Results show that learner contributions (LCs) are established in four different trajectories due to different teacher responses: Disregarded LCs, Selected LCs, Considered LCs, and Explored LCs. Also, the defining dimensions of the content are typically opened by teachers, with or without interaction. However, non-defining dimensions of the content are mainly opened due to co-constitution between teacher and students, most often as a result of considered or explored learner contributions. Learner silence and insufficient teacher responses to learner contributions, as well as the importance of responsible learners and sensitive teacher ears, are discussed in relation to pedagogical implications for teaching.

Critical competencies in teacher students' learning to teach

Keywords: Phenomenography, Pre-service teacher education, Student learning, Teaching / instruction

Presenting Author: Kyriaki Doumas, Linnaeus University, Sweden

This investigation explores critical aspects of competence in teaching and learning to teach as experienced by teacher students in practice parts of teacher education. The focus is on what teacher students experience as critical in critical events occurring during their teaching practice, and if and how they focus on the relation between teaching and pupil learning, critical from a theoretical educational perspective. Four groups of four teacher students in each, preschool, leisure, literature and physics teacher students, participated in the research. During a period of teaching practice they wrote narratives about critical events in their teaching sessions. Reflecting and focus interviews about the described critical events followed. The different forms of data collection give a possibility of triangulation and comparisons between methods. The general approach to the analysis of the material is contextual analysis. Three types of events were mainly identified through the analysis of critical events described by the teacher students: *Gaining authority*, *Facing the tension between the intended and the enacted object of learning* and *Creating relational didactics*. *Fronesis* as flexibility to act contextually and in situ as well as courage to act anew and to take the risk of failure are considered to be main teaching competencies.

Leadership for Innovative Teacher Teams in Higher Education

Keywords: Educational policy, Higher education, Teacher Professional Development, Lifelong learning

Presenting Author: Mieke Koeslag-Kreunen, Zuyd University of Applied Sciences / Maastricht University, Netherlands; **Co-Author:** Piet Van den Bossche, Maastricht University School of Business and Economics, University of Antwerp, Belgium; **Co-Author:** Marcel Van der Klink, Zuyd University of Applied Sciences, Netherlands; **Co-Author:** Wim Gijssels, Maastricht University, Netherlands

It has been argued that connecting teachers in teams may support innovation in higher education. A team approach enables members to co-construct innovative solutions through engaging in team learning behaviors. In practice, however, teachers are not used to share and discuss their practices together. Team leadership behavior is repeatedly marked as a crucial factor for stimulating team learning, but specific empirical insights are lacking; especially in the context of higher education. The present study examined which leadership behavior encourages learning behavior in university teacher teams who encounter innovative tasks in their job assignment. Results of hierarchical regression analyses on 52 teams show that shared leadership was the most important factor for supporting team learning, above and beyond vertical team leadership. Specifically, our findings show that teacher team members who encouraged challenging the status quo promoted team learning behavior, in contrast to focusing on structuring the task. Subsequently, their team learning behavior supported their effectiveness in dealing with their innovative tasks.

Understanding crowdworkers' learning practices

Keywords: Informal learning, Mixed-method research, Self-regulation, Workplace learning

Presenting Author: Anoush Margaryan, Goethe-Universität Frankfurt, Germany

This paper reports findings of a study exploring how crowdworkers develop their knowledge and skills in the course of their work on digital platforms. The focus is on learning initiated and self-regulated by crowdworkers: engaging in challenging tasks; studying professional literature/online resources; sharing knowledge and collaborating with others. The mixed-method study involves: (i) survey, (ii) interviews and observation of crowdworkers; (iii) interviews with crowdwork platforms providers, employers and policymakers; (iv) analysis of worker discussion fora and publically available materials about training provision within the platforms. The study draws on data from two platforms representing two types of crowdwork – microwork (CrowdFlower) and online freelancing (Upwork). Initial findings uncovered evidence for considerable individual and social learning activity within both types of crowdwork. Findings suggest that both microwork and online freelancing are learning-intensive and both groups of workers are learning-oriented and self-regulated. Crowdwork is a growing form of employment in developed and developing countries. Improved understanding of learning practices within crowdwork would inform the design and governance of crowdwork and empower crowdworkers to direct their own learning enhancing the developmental potential of crowdwork.

An Investigation Into Predictors and Mediators of Transfer of Training: A Time-Lagged Study Design

Keywords: Quantitative methods, Survey Research, Workplace learning, Lifelong learning

Presenting Author: Natalie Govaerts, KU Leuven - University of Leuven, Belgium; **Co-Author:** Eva Kyndt, KU Leuven, Belgium; **Co-Author:** Filip Dochy, KU Leuven - University of Leuven, Belgium

The aim of this study was to examine the effects of specific types of supervisor support on transfer of training, taking into account established trainee characteristics, such as trainees' motivation to learn and transfer and their training self-efficacy. More specifically, supervisors' pre-training information, role modelling & facilitation, request sharing, favourable attitude, coaching & feedback, openness, involvement & accountability, work coverage, and training participation were examined. In addition, the mediating effect of training retention is explored, as learning outcomes are a necessary, but not sufficient condition for transfer of training. A time-lagged design was used to investigate the relationships in the proposed model and it was evaluated using partial least squares path modelling (PLS-PM). Data was gathered through online questionnaires from 111 participants of work-related training. Results indicate that motivation to transfer and training retention positively predicted transfer of training three months after training. Motivation to learn and training self-efficacy did not have a significant direct relationship to transfer, nor did any of the specific types of supervisor support contribute directly to training transfer. However, it was found that trainees' motivation to learn and supervisors' involvement and accountability had an indirect effect on transfer of training through training retention.

Effects of online information provided by banks on learning and financial decision making

Keywords: Cognitive skills, Content analysis, Technology, Lifelong learning

Presenting Author: Baerbel Fuerstenau, TU Dresden, Germany; **Co-Author:** Mandy Hommel, TU Dresden, Germany; **Co-Author:** Claudia Leopold, Université de Fribourg, Switzerland; **Co-Author:** Hector Ponce, Universidad de Santiago de Chile, Chile; **Co-Author:** Mario Lopez, Universidad de Santiago de Chile, Chile

Financial competence has become increasingly important for citizens, especially in case they have to decide about complex financial products, such as mortgages. Mortgages have long-term consequences for individuals' financial situations, and potentially for the economy. In order to avoid wrong decisions, potential first-time homebuyers often consult the internet. Therefore, in a study we analysed whether information provided online by banks can support learning and decision making, and thus the development of financial competence. We included webpages of two banks differing in

quality and quantity of information. One hundred and one students took part in the study. They were randomly assigned to one of two experimental groups (bank 1 and bank 2), and a control group. All students answered behavioural questions, then surveyed the webpages of the respective bank, and took a retention and decision making test afterwards. Results did not show significant differences between the groups so that quality and quantity of information given did not seem to be crucial for learning. We can cautiously conclude that natural settings such as banks' webpages are only partly suitable for fostering financial competence about mortgages. Instead, systematic financial education using instructional research results (such as multimedia learning and text comprehensibility) seems to be needed.

The influence of cognitive strategies on solving concrete-operational concepts

Keywords: At-risk students, Cognitive skills, Metacognition, Special education

Presenting Author: Moritz Börnert-Ringleb, University of Potsdam, Germany; **Co-Author:** Jürgen Wilbert, Universität Potsdam, Germany

Mastery of concrete-operational concepts is an important aspect of cognitive development. It is associated with a range of learning outcomes and school achievement. At the same time, students with learning disabilities show lower levels of mastery of concrete-operational concepts. Interventions aiming at training concrete-operational concepts have proven to be possibly successful. A possible way of promoting concrete-operational concepts is the instruction of strategic operations. Nonetheless, construction of such instructional programs requires insights in involved strategic processes. In this context, several studies explore strategy use in different concrete-operational concepts, e.g. conservation. At the same time, these studies do not emphasize the differing effects of strategic operations on correct solution of the task. In the present paper we therefore focus on shedding a light on the influence of the individual strategic operations on the probability of correct solution of concrete-operational concepts. In this context, we address the question, to which extent the effect of isolated specific strategic operations varies. In addition, we focus on patterns of strategic operations, which might be in particular effective regarding correct solution of concrete-operational concepts. To address these questions, thinking-aloud protocols of 80 first and second graders were analyzed. Generalized linear mixed models, configuration frequency analysis and chi-square tests are performed to examine the contribution of isolated and combined strategic operations. The results are discussed and educational implications are highlighted.

The Authority to Choose Seclusion in Inclusion - An ASD Perspective on Educational Settings

Keywords: At-risk students, Cognitive skills, Learning and developmental difficulties, Special education

Presenting Author: Mona Holmqvist, Malmö University, Sweden; **Co-Author:** Lotta Andersson, Malmö University, Sweden

The aim of this study is to examine reasons for the increasing amount of pupils with autism (Wing, 1996) who refuses go to school. Three hypotheses were examined; (1) students are subjected to excessive demands in respect of social interaction and participation; (2) today's school policy in Sweden places high demands on pupils' executive ability, which means that it is expected they manage to organize and plan their work independently; and (3) students' problems may be reduced if they are exposed to a less amount of excessive stimuli. Data from 1.799 questionnaires and 15 interviews are analyzed. The results show that there is an unwittingly lack of deeper understanding about the pupils' specific deficits, which results in teachers forcing their pupils into situations which become impossible for them to cope. Offering the pupils opportunities for seclusion in the inclusive settings to help them sort their impressions and recover, as well as written or visual disposition to guide how to work with the tasks they have to solve would increase the quality for inclusive education and increase the possibility for the pupils to cope.

Social skills and social network dynamics: A longitudinal study in inclusive classrooms

Keywords: Peer interaction, Primary education, Social development, Special education

Presenting Author: Ariana Garrote, University of Zurich, Switzerland; **Co-Author:** Elisabeth Moser Opitz, University of Zurich, Switzerland

A considerable number of studies show that pupils with special educational needs (SEN) are at risk of experiencing difficulties in their social participation in mainstream classrooms. Low levels of social skills are suggested to be a reason why pupils with SEN have difficulties to build and maintain social relationships with peers. However, empirical contributions investigating potential reasons for the risk of pupils with SEN experiencing these difficulties are lacking. This paper addresses this research gap by studying the social network-behaviour dynamics in inclusive classrooms with longitudinal

data on social skills and social networks. The analysis of N = 692 pupils in 38 inclusive classrooms showed that pupils with an intellectual disability (ID; n = 43) had lower levels of social skills than their peers, but were similarly involved in social relationships. In addition, a longitudinal network analysis revealed that pupils did not select their social relationships based on the social skills of peers, but based on gender, popularity, and rejection within the classroom. Further, social influence effects were found, meaning that pupils influenced each other positively over time regarding the development of social skills. Summarizing, pupils with ID are capable of building and maintaining social relationships regardless of their low levels of social skills. Further, due to positive influence effects of social networks, they can improve their social skills in interactions with peers. Therefore, creating opportunities for social interactions seem to be a key strategy to foster social participation.

Reciprocal Relationships between Attitudes and Performance in Students with LD in Mathematics

Keywords: Achievement, Attitudes and beliefs, Learning and developmental difficulties, Mathematics

Presenting Author:Linda Salihu, University of Prishtina, Kosovo; **Co-Author:**Mikko Aro, University of Jyväskylä, Finland;

Co-Author:Pekka Räsänen, Niilo Mäki Institute, Finland

Students' attitudes and performance in school subject-matter tasks play an essential role in terms of how students intend to approach the certain task. The present study examined the relationships between attitudes and performance in students with learning difficulties in mathematics during their transition from primary to middle school. A total of 85 students, out of 233 tested, identified as having learning difficulties in mathematics were assessed for their math skills and reading comprehension. The findings of the study confirm that the relationships between attitudes and performance in students with learning difficulties in mathematics are reciprocal. On the one hand, students' attitude during transition from primary to middle school formed the basis for subsequent math performance. On the other hand, it is also found that math performance has triggered formation of subsequent attitudes toward math-related tasks.

Assessing children's cognitive and emotional self-regulation in two naturalistic play settings

Keywords: Assessment methods and tools, Early childhood education, Self-regulation, Video analysis

Presenting Author:Pauline Slot, Utrecht University, Netherlands; **Co-Author:**Hanna Mulder, Utrecht University, Netherlands; **Co-Author:**Paul Leseman, Utrecht University, Netherlands

The preschool period is marked by rapid growth of children's self-regulation and related executive functions. Self-regulation is considered an important aspect of school readiness and has been found to be related to academic and social-emotional outcomes in later childhood. Previous research has shown positive effects of play and play-based curricula on children's self-regulation. In the current study, three-year-olds' self-regulation was observed in two naturalistic play settings: one structured and more goal-oriented situation and a more open-ended play situation. The present study studied whether the display of self-regulation behavior was related to the type of play and how the children's observed self-regulation and test-based executive functions were related in the two play situations. Results showed that children showed higher levels of self-regulation during the more structured play setting compared to the open-ended setting. Furthermore EFs were significantly related to cognitive aspects of self-regulation children displayed in the more structured and goal-oriented play setting, but not to behavioral self-control. EFs were, however, significantly related to behavioral self-control in the more open-ended play setting with kitchen materials. Possible implications of the findings for early childhood programs are discussed.

Implicit theories and self-regulation in kindergarten: Development of a self-report instrument

Keywords: Assessment methods and tools, Early childhood education, Self-efficacy, Self-regulation

Presenting Author:Miriam Compagnoni, University of Zurich, Switzerland; **Co-Author:**Yves Karlen, University of Zurich, Switzerland

Children's implicit theories about the nature of their abilities, whether they are stable (fixed theory) or are susceptible to change (malleable theory), are related to both achievement and self-regulatory abilities (Burnette, O'Boyle, VanEpps, Pollack, & Finkel, 2013; Dweck, 2000). Moreover, researchers showed that interventions who target students' implicit theories influence how students interpret and respond to challenges and thus positively impact their self-regulatory abilities (Paunesku et al., 2015). Even though research suggests that five to six year old children may already formed beliefs about

the nature of their abilities as either fixed or malleable (Gunderson et al., 2013) and should be able to differentiate between various dimensions of their ability self-concept, empirical support is limited. To date, no instrument has been available that can reliably and validly assess implicit theories in children under the age of seven. We aim to develop and evaluate an instrument to assess implicit theories of ability in kindergarten. The objective is to investigate the mean level and structure of this self-concept for children as young as five to six years. Furthermore, the interaction of self-concepts, such as implicit theories of ability and ability self-concepts, is unclear. We aim to further the understanding of the development and structure of implicit theories in kindergarteners as well as generate new insight into the complex interplay between self-concepts and self-regulatory abilities in pre-schoolers.

Parent training to promote self-regulation in full- and preterm born toddlers

Keywords: At-risk students, Early childhood education, Parental involvement in learning, Self-regulation

Presenting Author: Kim Gärtner, Heidelberg University, Germany; **Co-Author:** Verena Clara Vetter, Heidelberg University Hospital, Centre for Child and Adolescent Medicine, Germany; **Co-Author:** Gitta Reuner, Heidelberg University Hospital, Centre for Child and Adolescent Medicine, Germany; **Co-Author:** Silke Hertel, Ruprecht-Karls-Universität Heidelberg, Germany

Self-regulation (SR) and executive functions (EF) are important prerequisites for academic achievement (McClelland & Cameron, 2012). Very preterm born children have an increased risk for an adverse development with regard to SR/EF (Mulder, Pitchford, Hagger & Marlow, 2009). Given the strong link between parenting behaviors and children's EF (Fay-Stammach et al., 2014), any effort to promote parental co-regulation and create environments in which children have opportunities to practice SR, seems like a promising way to counteract an adverse development. Up to now, there is no preventive parent training with special focus on SR development for parents of preterm toddlers. The present study aims to refine, adapt and evaluate existing parent training programs to promote the development of SR to the special needs of parents with preterm toddlers. Based on a quasi-experimental pre-post-test design with three months follow-up, parents of full-term (FT) and preterm (PT) toddlers (current sample: $N_{FT} = 55$, $N_{PT} = 23$) are randomly assigned to three treatment groups: 1) scaffolding, 2) combined scaffolding and sensitivity, 3) stress-management. Children are between 24 and 36 months of age. A multi-method approach is applied. Data collection is ongoing and will be finished by spring 2017. First results point towards high acceptance and benefit of the training programs. Parents are motivated to transfer the learned strategies to their everyday lives and report a high competence gain in promoting their child's SR, especially in the combined training group. Further results based on questionnaire and observational data will be reported to strengthen the findings.

Building stories together: How can a playful pedagogy support self-regulation in primary schools?

Keywords: Collaborative Learning, Metacognition, Self-regulation, Writing / Literacy

Presenting Author: David Whitebread, University of Cambridge, United Kingdom; **Co-Author:** Marisol Basilio, University of Cambridge, United Kingdom

Writing is the perfect example of a challenging cognitive task that requires self-regulation, and many children struggle with becoming effective writers. In the Play, Learning and Narrative Skills (PLaNS) project, we developed a playful approach to improve the writing skills of primary school children by providing collaborative building tasks preceding writing activities. Working in mixed ability groups, 5 to 10 year old children used LEGO sets to represent their stories and were encouraged to verbalise ideas that would inspire their writing. The building tasks had a great degree of freedom, so children could decide autonomously on their collaborative process: how to address the task, how to divide tasks in the group, how to merge their ideas into a single LEGO model. Teachers encouraged children to engage in metacognitive discussions about the process of working together, and about the process of writing. We measured the progress of 108 children in terms of their writing skills, metacognition, and collaborative skills (including socially-shared regulation) before and after the intervention –but not in a control group–, and found significant improvements. This playful pedagogy is a promising approach to improving self and socially-shared regulation that could be further tested in primary education.

Combining Generic and Content-Specific Practices in Exploring Teaching Quality in Physical Education

Keywords: Primary education, Student learning, Teacher Effectiveness, Teaching / instruction

Presenting Author:Charalambos Charalambous, University of Cyprus, Cyprus; **Presenting Author:**Leonidas Kyriakides, University of Cyprus, Cyprus; **Co-Author:**Ermis Kyriakides, University of Cyprus, Cyprus; **Co-Author:**Niki Tsangaridou, University of Cyprus, Cyprus

Trying to understand teaching quality and its effects on student learning, for years researchers have largely attended to either generic or content-specific teaching practices, without simultaneously attending to both. Aiming to address this research gap and attempting to complement recent works that attempted to do so but focused on cognitive outcomes, the present study considers both generic and content-specific practices when exploring teaching quality in Physical Education (PE) and its effects on student psychomotor learning. The main research question guiding this exploration concerns the added value of exploring the joint contribution of generic and content-specific teaching practices, as opposed to considering each type of practices in isolation. To answer this question we measured students' psychomotor growth, using a pre- and post- student performance test administered to the 3rd, 4th, and 5th grade students (N=944) that participated in the study, at the beginning and culmination of the school year. Three classroom observations were also conducted for each of the 49 participating teachers to measure teaching quality; finally, a student survey was used to tap instructional quality viewed through students' eyes. Data were analyzed by employing item response theory models, structural equation modeling, and multilevel modeling. The study findings suggest that the joint contribution of generic and content-specific teaching practices explains more teacher-level variance, compared to that explained when considering either type of practices in isolation. This finding has important theoretical and practical implications.

Characteristics of Parental Mediation of a History Museum's Curriculum

Keywords: History, Informal learning, Parental involvement in learning, Primary education

Presenting Author:Billie Eilam, University of Haifa, Israel; **Co-Author:**Merav Yosfan, University of Haifa, Faculty of Education, Israel

We examined parental mediation of a history museum's curriculum to their accompanying children during a museum visit. There is little research about this topic, in spite of the prevalence of this phenomenon as a form of informal education. Ten parent-child dyads (9-12 years old) were fitted with a small head-camera to record their entire visit, including their interactions with exhibits and related conversations. An external video camera captured their selected route and the duration spent in the museum and each of its galleries. The parents-children conversations were analyzed according to the grounded theory approach. Seven mediation categories were identified: mediating information, mediating the museum, activating the child, connection to the child's world, conduct in the museum, learning behaviors in the museum and general skills. Three of these categories dealt with the norm and accepted behavior in the museum, ways of learning in this museum environment, and the general learning that takes place during the museum's visit. These mediation categories were grouped together under the heading "Museum Conduct Mediation". The remaining four categories which related to mediation of the museum's curriculum, were grouped together under the heading "Museum Content Mediation." All these seven categories and the 40 mediation strategies that were identified, compose a model of the parental mediation in a history museum. Implications for museum design and informal education are discussed.

New Ways of Dealing with Lacking Measurement Invariance in Educational Research

Keywords: Out-of-school learning, Qualitative methods, School effectiveness, Teaching / instruction

Presenting Author:Markus Sauerwein, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Desiree Theis, German Institute for International Educational Research (DIPF), Germany

Educational research frequently aims to compare different groups or the development of certain (latent) constructs over time. For example researchers compare teaching quality between different countries, or the perception of teaching quality between groups (girls vs. boys). Furthermore in longitudinal studies researchers might also analyze the development of teaching quality across two or more measurement points. However, for such analyses measurement invariance (MI) between groups, subjects or measurement points is an essential precondition. In other words, we need to test if the same factor structure for a scale upholds between groups or across measurement points (MP). If the aim of a study is to compare scales between groups or MP a certain level of MI needs to be given. The following paper will discuss if lacking MI could also be an interesting result on its own, which should be interpreted and reported. Analyses are based on data of the Study on the development of all day schools (StEG) and PISA 2009.

Effects of Teaching and Learning Beliefs on Achievement – A Comparison of China and Germany

Keywords: Achievement, Comparative studies, Student learning, Teaching / instruction

Presenting Author:Anna-Katharina Praetorius, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Susanne Kuger, The German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Yi Qi, Educational Testing Service, United States; **Co-Author:**Eckhard Klieme, German Institute for International Educational Research (DIPF), Germany

The effects of teaching quality and learning beliefs on student achievement are usually investigated independently from each other although interactive effects are likely to be expected. In the present study, we investigated whether aspects of teaching (i.e., teacher-directed instruction and cognitive activating instruction) and learning beliefs (i.e., persistence and internal control of success) have distinctive as well as interactive effects on student learning and whether these effects differ between China and Germany using data from PISA 2012. The findings indicate that relations differ for the two countries; this is the case not only for relations of teaching and achievement as well as learning beliefs and achievement,

but also for interactive effects of teaching and learning beliefs on achievement. Implications for theory and practice are discussed.

Effects of inquiry learning on learning outcomes in adolescents' geography education

Keywords: Collaborative Learning, Motivation, Self-regulation, Teaching / instruction

Presenting Author: Merja Kuisma, University of Tampere, Finland

This study provides empirical evidence of effects of inquiry-based teaching and learning model called progressive inquiry on cognitive and affective learning results. The focus is on learning results among middle school and upper secondary students, and in all, 253 students were involved in the study. This way a comparison between different developmental stages can be made of the effects of the teaching and learning method in question. The results indicate that progressive inquiry improved cognitive learning results in both levels of the education system. In contrast to the cognitive learning results the results in the level of self-regulated learning and motivation are referred to as affective learning results. The previous level of self-regulated learning skills did not affect the cognitive outcomes in either of the student groups, and this study implies that the skills of self-regulated learning were enhanced in both student groups during the intervention period. In middle school it was the students with only sufficient skills in self-regulated learning that benefited the most from progressive inquiry, whereas in upper secondary school it was the students with the strongest self-regulation skills. Furthermore, in middle school the control and self-efficacy beliefs showed a statistically meaningful effect on cognitive results, but not in upper secondary school. Progressive inquiry showed a strong positive effect on learner's motivation level in middle school context. In upper secondary school the effect of the teaching and learning model on motivation level was not as clear.

Designing a training format supporting student teachers' parent-teacher communication competences

Keywords: Competencies, Design based research, Pre-service teacher education, Multimedia learning

Presenting Author: Karen De Coninck, Ghent University, Belgium; **Co-Author:** Ruben Vanderlinde, Ghent University, Belgium

Teachers worldwide are expected to possess the necessary competences to collaborate and communicate successfully with parents. However, teacher education institutes fail to help student teachers to develop these competences. To address these shortcomings, a design-based research (DBR) project was set up to design an innovative training program to foster student teachers' parent-teacher communication (PTC) competence development. This study reports about the first two processes of the DBR project: (1) analysis and exploration, and (2) design and construction. Regarding the first process, three data sources were consulted: literature, interviews with teacher educators (n=14) and student teachers (n=6), and an online questionnaire with student teachers (n=269). Regarding the second process, both literature and stakeholders (n=18) were consulted in order to define crucial design principles and to construct a prototype of a new training program. Findings show that more practical training and exercises are needed, particularly regarding the interpersonal and psychological dimension of the PTC competence. In this respect, the following design principles are put forward: authentic learning, specific pedagogical principles (learning by doing, learning through observation, receive immediate feedback and reflect on behavior), and blended learning. Discussion about these design principles with the stakeholders resulted in a prototype consisting of (1) an online theoretical introduction lesson on PTC, (2) two training sessions with online simulations, (3) one training session with face-to-face simulations, and (4) a reflection task. Next, it is important to start testing and refining this new training format in the following research phases.

Teachers' analysis of mathematics classrooms – How can different indicators complement each other?

Keywords: Assessment methods and tools, In-service teacher education, Mathematics, Pre-service teacher education

Presenting Author: Sebastian Kuntze, Ludwigsburg University of Education, Germany; **Co-Author:** Marita Friesen, Ludwigsburg University of Education, Germany

The teachers' analysis of processes in the mathematics classroom is a key professional requirement which is connected with mathematics teachers' criteria-related noticing and knowledge-based reasoning. For empirical research into teachers' perceptions of classrooms, methodological questions related to the choice of indicators correspond with specific foci on

particular theoretical constructs in the area of teacher expertise. This study consequently explores how different indicators for the teachers' criteria-related analysis of classroom situations empirically point to this aspect of teacher expertise in a complementary way: On the base of comments on classroom situations from more than 40 German in-service teachers collected through an instrument which combined open format and multiple-choice questions, two different sets of indicators for the teachers' analysis were focused on: On the one hand, a top-down coding of the open format answers afforded insight into how teachers connected their observations with corresponding professional knowledge. On the other hand, teachers' situation-related views about the quality of instruction could be tapped by the multiple-choice format answers. The results suggest that these different indicators – even though they might appear as relatively distant at first sight – correlated significantly. The results may hence be considered as a contribution to linking not only different expertise aspects of the teachers' analysis on the methodological level – knowledge-based reasoning and (potentially resulting) situation-related views in this case – but also as evidence which suggests a corresponding relationship of the theoretical constructs behind the different indicator sets.

Teacher self-efficacy: a study on validity and reliability of an Italian version of the “Ohio scale”

Keywords: Assessment methods and tools, In-service teacher education, Secondary education, Self-efficacy

Presenting Author: Lucia Scipione, University of Modena and Reggio Emilia, Italy; **Co-Author:** Maja Antonietti, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy; **Co-Author:** roberta cardarello, Università Modena e Reggio Emilia, Italy; **Co-Author:** chiara bertolini, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy; **Co-Author:** andrea pintus, University of Modena and Reggio Emilia - Department of Education and Human Sciences, Italy

This study investigate the construct validity and the reliability of an Italian version of the Teacher Self-Efficacy scale developed by Tschannen-Moran & Hoy (2001), also known as 'Ohio scale', a 24-item scale, administered to in-service second grade teacher. The TSES scale is found on three factors of Efficacy: Student Engagement, Instructional Strategies, and Classroom Management. In the Italian adaptation four professional dimensions of teacher efficacy are identified and assessed: student engagement, classroom management, instructional strategies and “traditional” strategies. The validity and reliability of the Italian version of the “Ohio scale” is confirmed. It is confirmed that the construct of self-efficacy is a multidimensional construct. Results suggest further investigation on teacher's professional contexts.

Cueing in Animations Leads to a Trade-Off between Knowledge of Terms and Transfer

Keywords: Comprehension of text and graphics, Educational Technology, Instructional design, Multimedia learning

Presenting Author: Christoph Mengelkamp, University of Würzburg, Germany; **Co-Author:** Kerstin E. J. Kasper, Pixelgenau Consulting GmbH, Germany

Cueing, also known as signaling, is a common instructional intervention when learning from animations. Based on the assumptions of cognitive theory of multimedia learning, cueing reduces extraneous cognitive load and, as a result, leads to better learning performance due to a better selection of the relevant content of an animation, a better organization and a better integration of that content into a coherent mental representation. Contrary to this assumption, we argue that cueing the elements of an animation when the respective term is mentioned in a synchronously spoken text, leads to a better knowledge about the naming of that element but a worse mental representation of the whole content. To test this assumption fifty-five participants learned from an animation showing how a cylinder deactivation in a gasoline engine works, either with or without cueing the components of the animation. Results showed that cueing was effective for terming the components of the animation, but had no effect on knowledge of facts about the engine and even a negative effect on transfer to new problems. The results are discussed with respect to the design of cues depending on the learning goal.

Twice is good! Test-Taking Fosters Repeated but not Initial Study of Multimedia Materials

Keywords: Comprehension of text and graphics, Experimental studies, Instructional design, Student learning

Presenting Author: Alexander Eitel, University of Freiburg, Germany; **Co-Author:** Katharina Scheiter, Leibniz-Institut für Wissensmedien (IWM), Germany

Are practice tests only helpful when having studied before taking them? This question was addressed in the present study contrasting two distinct hypotheses. First, test-taking fosters restudy because it provides information about the effectiveness of the initial study to which learners can adapt by optimizing their restudy behavior (i.e., indirect testing effect;

ITE hypothesis). Second, test-taking fosters initial studying because one simply knows about the test (i.e., test expectancy; TE hypothesis). Hence, learners can encode information that is specifically required for this type of test, optimizing performance. The two hypotheses were tested against each other in a multimedia learning scenario. Participants (N=85) did either not study or studied prior to taking a test, (re-)studied, and took the same test again. Tests required to recall and transfer knowledge. Supporting the ITE hypothesis, both recall and transfer performance increased with repeated study and test-taking, whereas only taking the test without having studied before did neither improve recall nor transfer performance. Results suggest that repeated study and test-taking is beneficial to multimedia learning because restudying can be used to counteract deficiencies from initial studying (i.e., indirect testing effect), and not because students just know the demands of the test (i.e., high test expectancy).

Information visualizations for a general audience: the designers' perspective

Keywords: Arts, Comprehension of text and graphics, Qualitative methods, Vocational education

Presenting Author:Annemarie Quispel, Avans University of Applied Sciences / Tilburg University, Netherlands; **Co-Author:**Alfons Maes, Faculty of Humanities Tilburg University, Netherlands; **Co-Author:**Joost Schilperoord, Tilburg University, Faculty of Humanities, Netherlands

Information visualizations are increasingly used in education and mass media. Such visualizations are created by an increasing number of designers. Little is known about the criteria they use in their work, since designers are used to work on the basis of intuition and experience, rather than explicit knowledge. Gaining more insight into the design practice would be beneficial for design education and, eventually, the general public. We investigated criteria for popular information visualizations from the designers' perspective. Results of interviews and literature reviews show that designers consider clarity the most important criterion, more important than attractiveness. However, in experimental studies, they have shown to prefer non-standard designs, which are considered unclear by non-designers. An explanation for this discrepancy may be that what they consider clear, may be less understandable for their visually less 'literate' audience. In that case, design education faces a challenge in overcoming this communication gap between designers and their audience.

When (no) more help is needed: Using eye movements to individually support multimedia learning

Keywords: Comprehension of text and graphics, Educational Technology, Learning Technologies, Multimedia learning

Presenting Author:Marie-Christin Krebs, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Thérèse Felicitas Eder, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Anne Schueler, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Katharina Scheiter, Leibniz-Institut für Wissensmedien, Germany

Regardless of the effectiveness of multimedia instructions in general, some learners have difficulties to adequately process multimedia materials (i.e., text-picture combinations). One possibility to support these learners is to provide personalized, just-in-time instructional support using an adaptive multimedia system. The adaptive multimedia system used in the reported study monitors and analyses online the learners' processing behavior based on the learners' eye movements. Pursuant to these analysis learners with inadequate processing behavior receive instructional support. In our experiment (N = 58) we investigated whether the adaptive multimedia system supports learners in processing multimedia materials more adequately and whether it is beneficial for the learning outcome. During learning, one group received adaptive instructional support based on their individual gaze behavior. The other group received no instructional support. After learning all participants completed a posttest. Results indicated an interaction between prior knowledge and adaptivity: Only learners with higher prior knowledge profited from the adaptive multimedia system. Learners with lower prior knowledge, however, performed significantly worse with compared to without instructional support. Implications for the use of an adaptive multimedia system for individual support are discussed.

Role of sender/peer feedback characteristics for performance and cognitive processing (eye tracking)

Keywords: Cognitive skills, Comprehension of text and graphics, Cooperative / collaborative learning, Quantitative methods

Presenting Author:Markus Berndt, Universitätsklinikum der Ludwig-Maximilians-Universität München, Germany; **Co-Author:**Jan-Willem Stribos, University of Groningen, Netherlands; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

Feedback literature identifies mindful cognitive processing of (peer) feedback and (peer) feedback characteristics – as well as the presence of justifications – as important for its efficiency. However, mindful cognitive processing has yet to be operationalized and investigated. Moreover, different (peer) feedback characteristics may have an effect on the perception of the feedback by the receiver and also induce varying amounts of cognitive load. In a 2 × 3 factorial design, peer feedback on an essay (elaborated specific feedback with/without justifications) and sender's competence (low/average/high) were systematically varied. Eye tracking data of the peer feedback reading process (gaze durations and transitions) was correlated with performance measures (text revision and peer feedback recall) to infer mindful cognitive processing. Peer feedback perception was measured in terms of fairness, usefulness, acceptance, willingness to improve, and affect which in part aggregates to perceived adequacy of peer feedback. Cognitive load was measured for peer feedback reading and performance tasks. Results: Inclusion of justifications interacted with sender's competence on perceived affect and improved text-revision performance. Cognitive load moderated the impact of justifications on text-revision performance. Eye tracking data proved to provide valid measures to infer mindful cognitive processing. In sum, there seemed to be more intense mindful cognitive processing when more transitions between two text elements occurred. More intense mindful cognitive processing did not necessarily lead to better performance but seemed to serve a compensatory purpose to sustain performance, especially when justifications for peer feedback were not provided.

Attraction or distraction? Eye-tracking comparisons of TD versus ASD learner gaze at visual displays

Keywords: At-risk students, Comparative studies, Educational Psychology, Experimental studies

Presenting Author: Mary Hanley, Durham University, United Kingdom; **Co-Author:** Deborah Riby, Durham University, United Kingdom

The primary school classroom is crucial environment for children in terms of their learning. An important question is whether the physical classroom environment can impact upon children's ability to pay attention and to learn. In the classroom there can be many things to capture attention other than the focus of a lesson, such as visual displays on classroom walls. The aim of this study was to use eye-tracking to explore the impact of visual displays on attention and learning for typically developing children and also for children functioning on the autism spectrum. Children watched bespoke video stimuli of a teacher delivering 'story time' and mini-lessons. Half of the videos had no visual distraction (NVD) and half had high visual distraction (HVD). We recorded the children's eye movements while they watched the videos to explore the effect of displays on their attention, and we designed worksheets based on the lessons to measure the impact on their learning. Visual displays had a significant impact on attention for all children, but to a greater extent for children with autism. Visual displays also had an impact on learning, whereby children had poorer learning scores in the HVD compared to the NVD lessons. Individual differences in age, verbal, non-verbal and attention abilities were important predictors of learning, but time spent attending the visual displays was the most important predictor. This novel and timely investigation has implications for the use of classroom visual displays for all children, but particularly for children with autism.

Using mobile eye-tracking to analyse learning behaviour in class: Two case-study examples

Keywords: Comprehension of text and graphics, Instructional design, Mathematics, Mixed-method research

Presenting Author: Markku Hannula, University of Helsinki, Finland; **Co-Author:** Enrique Garcia Moreno-Esteva, University of Helsinki, Finland; **Co-Author:** Miika Toivanen, Finnish Institute of Occupational Health, Finland

We used mobile eye-tracking and a qualitative analysis of the gaze data to analyse two case studies on problem solving behaviour in class. The students worked in pairs using GeoGebra software. We analysed the gaze video and the two ordinary videos qualitatively to identify details of the target student learning behaviour. Instead of individual glances, we looked at the sequences of gazes and interpreted them in the overall context of student problem solving. Our first case study the student wearing the gaze tracker had relatively long sequences of silent gazing. With gaze tracker, we gained additional information about his problem solving behaviour. In our second case study we observed students to repeatedly fail to observe relevant information on the screen. When we analysed our target student gaze during the critical events, we observed, that his gaze followed teacher's hand movement in the display. Our interpretation is that moving elements attract student visual attention to the extent that other, important information, can be missed. Despite the labour intensiveness, the gaze tracking methodology seems to be a promising tool for a fine grained analysis of student learning behaviour in class. It requires a lot of manual work and developing automatic coding of data is a worthwhile investment. One important finding of the pilot phase is that it is essential to have an interview with the student after the recorded lesson, preferably with the gaze tracking video as a stimulus.

Using real-world gaze proportions to investigate expert teacher priorities: An eye-tracking study

Keywords: Culture, Educational Psychology, Quantitative methods, Teacher Effectiveness

Presenting Author: Nora McIntyre, University of Sheffield, United Kingdom; **Co-Author:** Halszka Maria Jarodzka, Open University of the Netherlands, Netherlands; **Co-Author:** Robert Klassen, University of York, United Kingdom

Classroom teaching is complex. In the classroom, teachers must readily attend to disruptions and successfully convey new tasks and information. Outside the classroom, teachers must organise their priorities that are important for successful student learning. In fact, differing gaze patterns can reveal the varying priorities that teachers have. Teacher priorities are likely to vary with classroom expertise and can conceivably change with culture too. Therefore, the present study investigated expertise related and cultural teacher priorities by analysing their gaze proportions. To obtain this data, 40 secondary school teachers wore eye-tracking glasses, with 20 teachers (10 expert; 10 novice) from the UK and 20 teachers

(10 expert; 10 novice) from Hong Kong. We analysed gaze proportions during teachers' attentional (i.e., information-seeking) and communicative (i.e., information-giving) gaze. Regardless of culture, expert teachers' gaze proportions revealed prioritisation of students, whereas novice teachers gave priority to teacher materials. For culture-specific expertise, UK novices prioritises teacher materials more than UK experts and Hong Kong novices' prioritises non-instructional, non-student ('other') regions of the classroom more than Hong Kong experts, during both attentional and communicative gaze. Student-centredness as a hallmark of effective teaching has received support from the present teacher gaze data, which corresponds with conclusions from existing teacher effectiveness research.

Writing development in a linguistic and rhetoric perspective

Keywords: Cognitive development, Language (L1/Standard Language), Writing / Literacy, Lifelong learning

Presenting Author: Victoria Johansson, Lund University, Sweden; **Co-Author:** Pia Gustafsson, Lund University, Sweden;

Co-Author: Åsa Wengelin, University of Gothenburg, Sweden

This presentation addresses the issue of how to describe and evaluate writing development. We use a corpus of written texts from 10-year-olds up to adults to discuss how writing development can be described on the one hand linguistically, and on the other hand rhetorically. We are inspired by Myhill's (2008) discussion about teachers need to know more about different developmental trends in writing performances, in order to be able to intervene more strategically with their students. Research questions are: 1. How can syntactic features in the text be linked to rhetorical aspects of the texts? and 2. How does the development of syntactic and rhetorical abilities relate to age, and writing experience? Data consist of 190 written texts from 95 participants who each produced one narrative and one expository text on computer in an experimental setting. Syntactic features have been analysed both quantitatively and qualitatively. Results show that text length increase with age there, but that adults have shorter texts than adolescents. Investigating sentence types, declarative sentences are more common in narrative texts, and interrogative sentences are more common in expositives. Developmentally, adults use more interrogatives in expositives, and more fragments in narratives. Analysing sentence openings reveals that the youngest age groups use more time adverbials in their narratives, and more circumstantial adverbials in their expository texts, while the older age groups use a more varied repertoire of syntactic elements to highlight different aspects. This study stresses that teaching must relate rhetoric and syntactic aspects in their teaching of writing.

Effects of dyslexia on undergraduate students' writing processes and product

Keywords: At-risk students, Cognitive skills, Higher education, Writing / Literacy

Presenting Author: David Galbraith, University of Southampton, United Kingdom; **Co-Author:** Veerle Baaijen, Center for Language and Cognition Groningen, Netherlands

This quasi-experimental study was designed to assess the effects of dyslexia on the writing of 60 undergraduate students, half of whom had been assessed as dyslexic. All participants completed intelligence tests and a battery of spelling, decoding and working memory tests. These tests showed that students with dyslexia had significantly lower phonological/spelling ability but equivalent levels of verbal and non-verbal intelligence. Participants were then given 45 minutes to plan and write an article for the university newspaper discussing the legalisation of euthanasia. To identify the cognitive processes occurring during writing, half the participants were asked to complete the triple task (Kellogg, 1987) while producing the texts. Keystrokes were also recorded using Inputlog (Leijten & van Waes, 2013). The results showed that dyslexic students produced significantly shorter, poorer quality texts (even after spelling had been corrected), and that they paused for significantly longer between and within words. Analysis of the relationships between cognitive processes and text quality showed that whereas non-dyslexic writers produced better quality text the less they continued generating content during text production, dyslexic writers wrote better the more they continued generating content during text production. Mediation analyses indicated that the effect of dyslexia on quality was partially but not fully mediated by spelling ability and its effect on word-level pauses. We will argue that, over and above their spelling difficulties, adult writers with dyslexia have difficulties implementing their content plans during writing, and suggest that support should include strategies for the management of higher level writing processes.

Teachers as writers: the pedagogical impact of teachers' writing identities and personal practices

Keywords: Language (L1/Standard Language), Literacy, Teaching approaches, Writing / Literacy

Presenting Author: Lucy Oliver, University of Exeter, United Kingdom

The premise that teachers of writing should themselves write has been highly influential since the 1970s and forms a central tenet of professional development programmes such as the US National Writing Project. Predicated on a belief that 'teachers as writers' will bring the same kind of understanding of the writing process to the classroom as professional writers, the argument is that when teachers position themselves as writers in the classroom, instruction and learning are enriched. Yet relatively little appears to be known about the pedagogical consequences of teachers' writing or its impact on student outcomes.

This paper reports on a systematic review of the literature concerning classroom impact of teachers as writers. A keyword search of educational databases was conducted and over 400 potentially relevant papers located. These were screened over four iterations by two reviewers using agreed inclusion/exclusion criteria and graded for quality. 43 were found to address teachers' writing identities, personal writing and classroom practice. 22 papers satisfied all criteria and were subjected to in-depth analysis and synthesis. The findings reveal that the evidence base in relation to teachers as writers is not strong, particularly with regard to impact on student outcomes. Available data suggest that teachers often have narrow conceptions of what counts as writing and being a writer and that multiple tensions exist, relating to low self-confidence, negative writing histories, and the challenge of enacting teacher-writer positions in school. Some repercussions for student motivation and engagement are evident but impact on students' writing is unclear.

Effective writing interventions via revision instruction: The role of explicit process strategies

Keywords: Instructional design, Primary education, Self-regulation, Writing / Literacy

Presenting Author: Paula Lopez, University of León, Spain; **Co-Author:** Raquel Fidalgo, University of León, Spain, Spain; **Co-Author:** Gert Rijlaarsdam, University of Amsterdam, Netherlands; **Co-Author:** Mark Torrance, Staffordshire University, United Kingdom; **Co-Author:** Alba Gonzalez Moreira, University of León, Spain, Spain

This study aimed to determine whether 6th grade students need to know and apply explicit procedures for revising their text, or whether similar (or greater) benefit might be gained from developing their understanding of how readers respond to text combined with encouragement to revise but no teaching of explicit revision strategies. Our sample comprised 142 six grade Spanish students divided into 6 classes from two schools, with two classes per condition. In all conditions, students started by learning strategies for planning their text, at the same time that it was also stressed as the start point for revision in both experimental conditions. In the Observing Reader condition (OR) students observed the instructor reading and commenting on imperfect texts as input for revision. In the Observing Writer condition (OW), students were taught explicit revision-procedure strategies, principally by observing these being modelled by the instructor. In the control condition the instruction focused on set communicative goals for planning. The study followed a pretest-posttest-transfer test-follow up test design. Text quality was assessed by rating scales supported by anchor texts. We found evidence of immediate and sustained benefits for text quality of both interventions, relative to controls. However, we found no evidence of a benefit of learning revision strategy over observing a reader. Students wrote with digitising pens, providing real time measures of writing time-course. In our paper we will also present findings from these data.

Broadening classroom goal structures nomological network using doubly latent multilevel modeling

Keywords: Goal orientation, Motivation, Quantitative methods, Secondary education

Presenting Author: Lisa Bardach, University of Vienna, Austria; **Co-Author:** Marko Lüftenegger, University of Vienna, Austria; **Co-Author:** Gholam Hassan Khajavy, Department of Language Education, University of Bojnord, Iran; **Co-Author:** Seyyedeh Mina Hamed, English Department, Ferdowsi University of Mashhad, Iran

The present study aimed to expand the classroom goal structures nomological network by investigating relations with a broad array of motivational constructs: achievement goals, self-efficacy, interest, self-concept and personal best goals. To analyze the relations between mastery classroom goal structures and the motivational facets, we first applied recently developed doubly latent multilevel modeling that allows for a proper control for measurement and sampling error in classroom goal structures research. The sample consisted of 1200 secondary school students from 62 classes. Students filled out a paper-and-pencil-questionnaire including scales from the Goal Structure Questionnaire as well as measures for all motivational constructs during regular class. Results indicated positive relations between mastery classroom goal

structures and all motivational outcome variables. The theoretical and educational relevance of our findings are discussed.

The development of achievement goal orientations during the first school years

Keywords: Educational Psychology, Goal orientation, Motivation, Quantitative methods

Presenting Author:Katariina Nuutila, University of Helsinki, Finland; **Co-Author:**Heta Tuominen-Soini, University of Helsinki, Finland; **Co-Author:**Markku Niemivirta, University of Oslo, Norway

Achievement goal orientations (preferences for certain achievement-related goals and outcomes) play an important role both in terms of motivation and achievement. While these are known to be rather stable over the middle and high school years, the research on younger students' achievement goal orientations and their development is still sparse. In this study, we investigated i) how children's achievement goal orientations change from first to third grade, and ii) how these possible changes are related to each other. In addition, gender effects were examined. The data were collected from 18 classes in seven elementary schools in Southern Finland (N=244) during the three first school years, and consisted of teachers' evaluations of each child's achievement goals orientations (i.e., mastery, performance-approach, performance-avoidance and work-avoidance). The results from a series of latent growth curve models showed significant increase in both performance-approach and performance-avoidance over time, although the increase in performance-approach orientation was less steep for those with higher initial level. Significant individual differences in the rate of change were found only in performance-approach. Girls displayed higher mastery orientation than boys, and boys, in turn, were higher in performance-approach and work-avoidance orientations. No gender differences in the rate of change were found. In line with previous suggestions, our findings imply that children become more performance-oriented over the years.

Teaching Quality and Stress: Antecedents or Outcomes of University Instructors' Achievement Goals?

Keywords: Goal orientation, Higher education, Motivation, Teaching / instruction

Presenting Author:Martin Daumiller, University of Augsburg, Germany; **Co-Author:**Markus Dresel, University of Augsburg, Germany

Achievement goals of university instructors can be expected to be associated with instructors' teaching quality, and their perceived stress and strain at work. Cross sectional analyses have already confirmed relations of instructors' achievement goals with professional stress and teaching quality (Daumiller, Grassinger, Dickhäuser, & Dresel, 2016). However, goal theory research has mainly focused on unidirectional effects of goals on these outcomes, whilst reciprocal relationships have mostly been neglected but are highly plausible. The aim of this study was to examine the causal ordering of the effects of achievement goals with teaching quality and professional stress. At the interval of half a year, 347 university instructors (171 females; highest degree: 121 master, 226 PhD, thereof 87 full professors) were tested twice with regard to their achievement goals, teaching quality, and professional stress. The results revealed moderate to high stabilities of the individual goal classes (allowing preliminary statements about the extent to which goals can be influenced by other variables) and indicated that reciprocal effects with the outcome variables exist: Teaching quality predicted the adoption of task, learning avoidance, and work-avoidance goals but no effects were found for the reverse direction. Instead, relational goals positively and work-avoidance goals negatively predicted teaching quality. In regard to professional stress, appearance approach goals and normative avoidance goals emerged as positive predictors; whilst appearance avoidance goals and normative approach goals were negative predictors. Additionally, professional stress in T1 negatively predicted the adoption of task approach and task avoidance goals in T2, indicating a complex picture of motivational dynamics.

Boredom, wellness, and coping: An examination of relations among American teachers

Keywords: Educational Psychology, Emotion and affect, Motivation, Motivation and emotion

Presenting Author:Hadley Solomon, University of New Hampshire, United States; **Co-Author:**Beth Fornauf, University of New Hampshire, United States; **Co-Author:**Joy Dangora Erickson, University of New Hampshire, United States; **Co-Author:**Myles Lynch, University of New Hampshire, United States; **Co-Author:**Vasiliki Partinoudi, University of New Hampshire, United States; **Co-Author:**Minori Haga Stefan, University of New Hampshire, United States

Boredom in classroom settings has been associated with a host of maladaptive outcomes including dropping out of school and reduced overall wellness. Little work has been done to examine boredom in teachers and how it relates to teacher outcomes. The purpose of the current study was to examine teachers' self-reported boredom in classroom settings and its' relation to important motivational and affective constructs including appraisals of control and value and teacher burnout. A series of analyses were conducted to examine the relations of American teachers' (N 148) perceived boredom to outcomes including teacher self-efficacy, burnout, appraisals, and coping. Results indicate teachers reporting higher levels of boredom also report lower self-efficacy for teaching, lower appraisals of control and value, increased burnout, and increased reliance on substance use as a coping mechanism. Results, implications, and significance of these findings will be discussed.

Examining Survey and Interview Measures of Individual Interest

Keywords: Arts, Attitudes and beliefs, Mixed-method research, Motivation

Presenting Author: Amanda Durik, Northern Illinois University, United States; **Co-Author:** Sarah Coley, Northern Illinois University, United States; **Co-Author:** Steven McGee, The Learning Partnership, United States

Many researchers use rating scale survey measures of individual interest because surveys have the benefit of efficiency with regard to collecting data for large groups of people. However, it is important to know whether survey approaches correspond with a lengthier interview approach. This research aimed to evaluate the correspondence between several self-report survey measures of individual interest and an interview measure. College student participants ($N = 138$, 66% women) rated their individual interest in the domain of visual arts on survey items that captured various aspects of individual interest, including feeling, meaning, and perceived knowledge. Participants also responded to a series of interview questions that were designed to assess individual interest. The interview responses were quantified in order to correlate them with the rating scales. Strong correlations between the rating scale survey measures and the interview were observed. In addition, both survey and interview measures positively predicted a behavioral measure of interest, exploration. These results suggest that data from survey measures of individual interest can be similar to those obtained with an interview. Remaining questions hinge on how individuals become aware of their interests in order to accurately report interest in either context.

A Conceptual Model of Internal and External Factors that Support Interest Development within Domains

Keywords: Cognitive development, Developmental processes, Educational Psychology, Motivation

Presenting Author: Tamara Jetton, Central Michigan University, United States; **Co-Author:** Jonna Kulikowich, Penn State, United States

Individuals have the capacity to both think and feel, and the power of these cognitive and affective factors within them support their progress toward expertise. Without the motivation or will to learn, many individuals cut short their progression toward expertise in a domain; it is their will and interest in examining and investigating information that drives and propels individuals toward expertise (Alexander, 2010; Renninger & Hidi, 2016). This research examines the extant research regarding interest development within an academic domain. Using the theoretical framework of the Model of Domain Learning (Alexander, 2003) and the Four-Phase Model of Interest Development (Renninger & Su, 2012), we explore the internal cognitive and motivational supports, and the external environmental supports for maintaining and increasing interest as individuals progress toward expertise within a domain. Using this framework and the extant literature, we constructed a conceptual model of internal and external variables that support and increase interest as learners progress from acclimated or novice domain learners to more competent learners and then to proficient learners who are experts in the field. This roundtable discussion will focus on the presentation of this model, along with a discussion of how each internal and external variable functions to support acclimated, competent, and proficient learning with an academic domain. Further discussion will focus on interest measurement, in light of this conceptual model.

Measuring teachers' and students' empathy

Keywords: Emotion and affect, Informal learning, Motivation, Motivation and emotion

Presenting Author: Csaba Gáspár, University of Szeged, Hungary

Empathy is a really complex concept, the meaning of which has gone through several alternations during the last century. Many disciplines (e.g. sociology, linguistics, psychology or ethics) show equal interest to empathy in different ways (Irishkanova et al., 2003), which can be a reason for it not being clearly defined so far. From one perspective, empathy is even a key factor for teachers' and students' success. Several studies (e.g. Swan & Riley, 2012; Vorkapić & Ružić, 2013) deal with examining teachers' empathy using both qualitative and quantitative methods. According to Davis (1980), empathy is a multidimensional construct with four dimensions (fantasy, empathic concerns, perspective taking and personal distress), which can be measured by his Interpersonal Reactivity Index. In our research this measurement tool was applied as well. Teachers and their students' level of empathy was examined in 2015-2016 (N Teachers: 69, N students: 525). We examined students' empathy in three different age (at the age of 12, 15 and 18) while we examined teachers' empathy based on the number of years of their teaching practice. Based on our first results there are significant difference between the examined age groups, empathic concern and perspective taking stronger at the age of 18. Considering teachers empathy no significant results were shown yet either based on gender or the number of theaching years.

Videotaped lessons as means to enhance reflection and knowledge of secondary mathematics teachers

Keywords: Mathematics, Teacher Professional Development, Teaching / instruction, Video analysis

Presenting Author: Ronnie Karsenty, Weizmann Institute of Science, Israel

The VIDEO-LM Project aims to enhance mathematics teachers' reflective skills, as well as their mathematical knowledge for teaching, through watching and discussing videotaped lessons of unknown teachers. Discussions are guided by the use of an analytic framework, consisting of six viewing lenses, which directs teachers to explore the videotaped lessons from various core aspects of the mathematics teaching practice. The lenses are (1) mathematical and meta-mathematical ideas around the lesson's topic; (2) explicit and implicit goals that may be ascribed to the teacher; (3) the tasks selected by the teacher and their enactment in class; (4) the nature of the teacher-student interactions; (5) teacher dilemmas and decision-making processes; and (6) beliefs about mathematics, its learning and its teaching as inferable from the teacher's actions. VIDEO-LM professional development courses have been offered to secondary mathematics teachers in Israel since 2012. In order to investigate the impact of these courses, data was gathered from 17 implementation sites during 2012-15, with a total of 212 participants. Several types of qualitative content analyses were conducted. Findings show that using the six-lens framework in video-based peer conversations supports the development of a reflective language, with which teachers relate not only to the teaching events watched, but also to their own practices. In addition, the analyses of several cases point to a considerable growth in teachers' mathematical knowledge for teaching, as measured by using the MKT categories defined by Ball and her colleagues.

Working with learner errors in classrooms: the Data Informed Practice Improvement Project

Keywords: Mathematics, Teacher Professional Development, Teaching / instruction, Video analysis

Presenting Author: Karin Brodie, Wits University, South Africa; **Co-Author:** Nicholas Molefe, Wits University, South Africa;

Co-Author: Abel Uverhaviwe, Wits University, South Africa

This presentation examines changes in practice among high school mathematics teachers who participated in the Data Informed Practice Improvement Project (DIPIP) over a period of three years. The project worked with teachers in professional learning communities, with a focus on understanding the reasoning behind learners' errors and working with learners' partially valid reasoning, in order to develop teachers' knowledge for teaching and improve their instructional practice. The focus on learner errors was intended to address teachers' pedagogical content knowledge, which then supported teachers to engage with their own content knowledge. All teachers notice errors, however very few think about errors as evidence of learners' valid reasoning or opportunities for learning. Teachers who participated in DIPIP worked with learners' errors in tests, in interviews with learners, in planning lessons and in teaching in order to think more deeply about their content and pedagogical content knowledge and their practice. This presentation will focus on an analysis of teachers' lessons, before, during and after the project, using the MQI tool and selected case studies. The analysis shows that most teachers made small but significant changes in their practice on most dimensions.

The PRACTISE professional development program: using classroom video to foster scientific discourse

Keywords: Science education, Teacher Professional Development, Teaching / instruction, Video analysis

Presenting Author: Hilda Borko, Stanford University, United States; **Co-Author:** Jonathan Osborne, Stanford University, United States; **Co-Author:** Florencia Gomez Zaccarelli, Stanford University, United States; **Co-Author:** Evan Fishman, Stanford University, United States; **Co-Author:** Emily Reigh, Stanford University, United States; **Co-Author:** Anita Tseng, Stanford University, United States

This presentation examines the efficacy of the Practicum Academy for Improving Science Education (PRACTISE) – a practice-based approach to science professional development (PD) for elementary (grades 3-5) classroom teachers. The PD focuses on instructional practices to support scientific discourse, specifically argumentation from evidence, among students. The decision to focus on scientific discourse is grounded in theory and empirical findings regarding the importance of classroom discussions of key scientific concepts and practices for fostering students' conceptual understanding and scientific reasoning. The PRACTISE model includes a summer institute followed by a teaching practicum in a local summer school program, and follow-up sessions during the year. Videos of participating teachers' science lessons situate the PD in the core activities of teaching, providing an opportunity for the teachers to study their classroom discourse practices collaboratively. The project used a two-cohort design to test the effectiveness of the PRACTISE model and added value of the practicum. Cohort 1 participated in the full PD program; Cohort 2 participated in the summer Institute and follow-up sessions only. Ratings of videos of classroom science lessons indicate that the PRACTISE PD was effective for helping teachers to incorporate science discourse into their classroom instruction. Findings regarding the added value of the practicum are mixed. This research contributes to our understanding of how to best

prepare teachers to engage their students in scientific discourse using evidence-based argument, which is of considerable interest to the fields of science education, professional development and teacher education.

Pushing teachers to rethink and change their practice on goal clarity in video-based discussions

Keywords: In-service teacher education, Teacher Professional Development, Teaching / instruction, Video analysis

Presenting Author:Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Martina Jerabek, Technische Universität München (TUM), Germany; **Co-Author:**Tina Seidel, Technische Universität München (TUM), Germany

Teacher professional development (PD) research points out core features that support teachers' learning. Our study contributes to this research strand by adopting Desimone's (2009) conceptual model for studying the effects of PD and examining how facilitated video-based discussions in an one-year practice-oriented PD program, the Dialogic-Video-Cycle (DVC), push teachers to rethink their teaching routines regarding goal clarity and to incorporate knowledge and skills learned in PD into their teaching. We chose to focus on goal clarity because the clear communication of lesson goals has been shown to have positive effects on students' perception of learning conditions, learning motivation and knowledge development. We coded and analyzed videotapes of two DV cycles in 2-minute segments as well as videotapes of pre and post teaching of the six DVC's participating teachers for the full lesson. Our findings indicate that the PD facilitator played an essential role in the video-based discussions about goal clarity and that the video-based discussions provided practice-based opportunities for the teachers to rethink their teaching routines. Furthermore, our findings show that teachers significantly changed their teaching practice from pre to post test by incorporating knowledge and skills learned in PD into their classrooms. With this study we added value to the question of how PD can be related to the teaching practice. In addition future implications for designing video-based facilitation to push teacher learning forward are discussed.

Cognitive and non-cognitive predictors of early academic achievement in higher education

Keywords: Achievement, Higher education, Metacognition, Motivation

Presenting Author:Jonas Willems, University of Antwerp, Belgium; **Co-Author:**Liesje Coertjens, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Vincent Donche, University of Antwerp, Belgium

As in other European countries in which there is no entrance test to university, study success rates in Flanders' (Dutch speaking part of Belgium) first year of higher education (FYHE) are low. This has considerable psychological and financial costs for the individual student, the family and the society. Decades of research have been carried out to better understand why some students are more successful than others in FYHE. Despite this overwhelming amount of literature on determinants of academic achievement, the combination of cognitive and non-cognitive factors is less often studied. Therefore, the main aim of this research is to explore the extent to which the combination of cognitive (*prior knowledge*) and non-cognitive (*processing strategies, regulation strategies, academic motivation, self-concept self-efficacy*) variables predict academic achievement of students in FYHE, after controlling for pre-entry characteristics (*age, gender, prior education*) and adopting an integrative research perspective. More concretely, structural equation modelling was used to investigate the extent to which the aforementioned variables together predict grade point average and academic success (percentage of study points obtained) after the first semester of FYHE. Thus, students' academic achievement in FYHE is conceptualised by the seldom used measure of *early* academic achievement. Data of 335 first-year students within two faculties of science of a Belgian university college were gathered at the beginning of academic year 2015-2016. Results show that cognitive variables and pre-entry characteristics are important predictors of early academic achievement. However, evidence for the hypothesis that non-cognitive variables are determinants of early academic achievement, is limited.

Effect of undergraduate research on motivation and self-efficacy beliefs about research

Keywords: Higher education, Motivation, Researcher education, Self-efficacy

Presenting Author:Floris van Blankenstein, Leiden University, Netherlands; **Co-Author:**Nadira Saab, Leiden University, Netherlands; **Co-Author:**Roeland M. Van der Rijst, ICLON-Leiden University Graduate School of Teaching, Netherlands; **Co-Author:**Paul Van den Broek, Leiden University, Netherlands

Some research suggests that participating in undergraduate research increases feelings of self-efficacy about several

research skills. However, this evidence is scarce and moreover, there seems to be little evidence about the impact of undergraduate research on motivation for research. The aim of this study was to investigate how students' self-efficacy beliefs about collaboration and writing research papers, and their intrinsic motivation for doing research and writing research papers would develop over time while they participated in undergraduate research projects. During a one-year bachelor course, students practiced doing research in groups of around 25 students. They completed questionnaires three times during the year. In addition, 12 students were interviewed about their motivation and self-efficacy beliefs. Self-efficacy for collaboration and writing and intrinsic motivation for writing increased significantly over the year. Intrinsic motivation for research did not change significantly. The interview data suggest that experience is an important factor that explains increases in self-efficacy. Factors that may explain the lack of an increase in intrinsic motivation are a sense that the research project is irrelevant and too many rules that need to be followed when conducting research. Motivation may increase when students have more autonomous control over their research project.

Graduates' evaluations of the usefulness of their university education in early career situation

Keywords: Competencies, Higher education, Mixed-method research, Reflection

Presenting Author:Tarja Tuononen, University of Helsinki, Finland; **Co-Author:**Anna Parpala, University of Helsinki, Finland; **Co-Author:**Sari Lindblom, University of Helsinki, Finland

The development of graduates' generic skills at the university and their satisfaction of university education after entering the working life have been explored in many studies (Crebert et al. 2007; Tynjälä et al. 2006). These studies have mostly applied quantitative and group-level analysis. Research on individual qualitative differences has been scarce. In the present longitudinal mixed-method study, we aim to explore how graduates with different skills to evaluate their competences at the time of their graduation differ in their evaluations of the usefulness of their university education and job satisfaction in early career situation. The categorisation of graduates to either rich or limited descriptions of academic competences was based on our previous study (Authors, in press). The present study extends the previous study by exploring these graduates after three years of graduation. Follow-up questionnaire data were analysed using independent samples t-test and content analysis. The results showed that graduates with rich descriptions of their academic competences evaluated university education more useful in their current jobs than graduates with limited descriptions. There were no statistically significant differences between the graduates with rich and limited descriptions of their competences in neither satisfaction of the degree nor job satisfaction. The results however showed qualitative differences in graduates' experiences of the usefulness of university education and in what kind of challenges they have had in working life. This study indicates that graduates' skills to recognise their competences at the time of their graduation may affect the challenges they have in their future employability.

Biology students' learning outcomes, self-efficacy beliefs and study success in PBL course

Keywords: Biology, Higher education, Self-efficacy, Problem-based learning

Presenting Author:Heidi Hyytinen, University of Helsinki, Finland; **Presenting Author:**Viivi Virtanen, University of Helsinki, Finland; **Co-Author:**Heikki Hirvonen, University of Helsinki, Finland; **Co-Author:**Sari Lindblom, University of Helsinki, Finland

Self-efficacy beliefs and self-monitoring are beneficial for academic achievement. The present study analyses the relations between learning outcomes, self-efficacy beliefs, self-reported grades and course grades of the first- and second-year biology students (n=61) in problem-based learning environment. The self-report data measuring students learning outcomes and self-efficacy beliefs were collected in the end of field course in ecology research. The data were analysed with quantitative and qualitative procedures. Two different student groups were identified in the analysis, which showed differences in experiences of learning outcomes, but the groups did not differ in terms of the self-efficacy beliefs or course grades. The results further showed that students' self-reported grades differed from the course grades. Students whose course grades were higher than their self-reported grades scored the lowest on self-efficacy beliefs. The results indicate that students with lower levels self-efficacy more likely underestimate their grades. However, unclear assessment criteria can also explain the differences between students' self-reported grades and course grades.

How students use smart phones and tablets in learning science and mathematics?

Keywords: Educational Technology, Primary education, Student learning, Survey Research

Presenting Author: Margus Pedaste, University of Tartu, Estonia; **Co-Author:** Olev Must, University of Tartu, Estonia; **Co-Author:** Äli Leijen, University of Tartu, Estonia; **Co-Author:** Mario Mäeots, University of Tartu, Estonia; **Co-Author:** Leo Aleksander Siiman, University of Tartu, Estonia; **Co-Author:** Külli Kori, University of Tartu, Estonia; **Co-Author:** Liina Adov, University of Tartu, Estonia

Smart phones and tablets are actively used in everyday life but it's not clear for what and how often these are used in learning context. In our study we investigated on what purposes and how often mobile devices were used in learning science and mathematics. We conducted a survey where 3521 students from 6th and 9th grade evaluated their frequency of using mobile devices in lessons and homework in three competences areas: information, communication and content creation. Hierarchical cluster analysis enabled to distinguish five groups of students: *digital natives*, *information students*, *communicating information students*, *content creation students*, and *nonusers*. The first four characterize students (50.1%) who use mobile devices for learning science and mathematics at least once in a week. The group of nonusers (49.9%) used mobile devices for learning once or twice in a month or less. Among these five general groups can be differentiated 11 sub-groups and the profiles of these groups help to design new interventions to support effective use of smart phones and tablets in learning. In the design process should be also taken into account information about students' gender and age group. Our results showed that the distribution of boys and girls as well as 6th and 9th grade students vary in different groups – boys belong more often to the groups *content creation students* and *digital natives*, the 9th grade students are more often in the group of *communicating information students* and, the 6th grade students in the group of *nonusers*.

Creating technology-based learning scenarios to support observation skills in VET schools

Keywords: Design based research, Educational Technology, Teaching / instruction, Vocational education

Presenting Author: Valentina Caruso, Swiss Federal Institute for Vocational Education and Training, Switzerland; **Co-Author:** Alberto Cattaneo, Swiss Federal Institute for Vocational Education and Training SFIVET, Switzerland; **Co-Author:** Jean-Luc Gurtner, University of Fribourg, Switzerland

Observation is a relevant skill for professionals in different fields. However, at present, very little pedagogical attention has been given to the instructional ways to promote the acquisition of this skill, especially in initial VET systems. In this study, we discuss the various conceptions of observation for the profession of clothing designers and suggest two instructional scenarios to foster the acquisition of this skill in Swiss VET schools. Each of the two scenarios was implemented in a paper-based version first and then in a technology-enhanced one, so to investigate also to what extent technology can contribute to the promotion of observation. Twenty-eight learning activities were run in two clothing designers' schools of Canton Ticino over one semester; they involved six teachers and sixty-eight learners. Data collection was carried out by means of semi-structured interviews with teachers and learners. All activities were video-recorded too. The data were analyzed using a structuring content analysis approach. Findings show that observation is a transversal skill in the curricula of the clothing designers, while visual cues generated by the learners and superimposed images could be two effective ways to promote observation. The use of technology is also perceived as an added value to increase the quality of teaching and the interactions between teachers and learners.

Interactivity is not sufficient for imagination-based integration of external representations

Keywords: Design based research, Distributed cognition, Educational Technology, Science education

Presenting Author: Prajakt Pande, Homi Bhabha Centre for Science Education, Tata Institute of Fundamental Research, India; **Presenting Author:** Aditi Kothiyal, Indian Institute Of Technology Bombay, India; **Co-Author:** Rwitajit Majumdar, Indian Institute of Technology Bombay, Mumbai, India; **Co-Author:** Harshit Agrawal, Homi Bhabha Centre for Science Education, Tata Institute of Fundamental Research, Mumbai, India; **Co-Author:** Sanjay Chandrasekharan, Homi Bhabha Centre for Science Education, Tata Institute of Fundamental Research, Mumbai, India

We report the design, development and testing of a fully manipulable computer interface, designed (a) as an intervention tool to support imagination-based integration of multiple external representations (MERs), and (b) as a probe to understand the cognitive processes involved in MER integration. The interface has fully manipulable and interconnected MERs (simulation, graph and equation) representing a simple oscillator (pendulum) system. The interface design is inspired by distributed and embodied cognition approaches. We assessed MER integration using this interface, with 7th grade students, who interacted with the interface for an hour. They then answered, as well as verbally reasoned about questions that tested MER integration. Students' actions on the interface (gaze and mouse clicks) were recorded during their interaction with the interface. These were correlated to their reasoning, to understand actions (patterns of interaction) that could have potentially led to integration. The results provide a very nuanced view of the relationship between manipulability/interaction and integration. Good performers (on the MER integration tasks) had a high level of interaction, but with significant variations between participants, suggesting that interaction is needed for integration, but there is no single interaction pattern supporting integration. However, students exhibiting similar interaction patterns as the good performers performed badly in the integration tasks. This suggests interactivity is not sufficient for MER integration. The results indicate that interactivity can scaffold MER integration, but cannot guarantee it. Support from facilitators is needed for MER integration, as in any other complex task where novices' attention needs to be guided.

Blended analytics: A first step in capturing and visualizing physical and digital learning processes

Keywords: Computer-assisted learning, Educational Technology, Learning analytics, Teaching / instruction

Presenting Author: Sarah Howard, University of Wollongong, Australia; **Co-Author:** Kate Thompson, Griffith University, Australia; **Co-Author:** Jie Yang, University of Wollongong, Australia; **Co-Author:** Jun Ma, University of Wollongong, Australia; **Co-Author:** Abelardo Pardo, University of Sydney, Australia

Current methods of classroom research have struggled to meaningfully capture the longitudinal and complex nature of learning processes. To complicate this, teachers are increasingly expected to “blend” their traditional face-to-face practice with learning in digital places. However, in doing this learning becomes increasingly invisible, as it has been difficult to capture how students learn through a digital device. Therefore, it has been difficult to understand how learning happens across physical and digital blended learning spaces. Multimodal methods are needed to capture a wider range of classroom data to understand how students interact, use digital technologies and other resources in these spaces in their learning processes. Tools to meaningfully communicate findings to teachers, to support students’ learning processes and learning design, are also needed. In this paper, we present a combined classroom data collection method, which includes observations in both physical and digital spaces. This paper will specifically address the first component: observation of the physical classroom, through a pilot study and early video analysis of a classroom video system in an Australian Year 1 classroom. The video analyzed shows five students’ working on a writing task. Results from video tracking show a range of student movement patterns, which can inform learning analytics design and unpack students’ learning processes. Implications of the findings, design for modeling observation data and developing learning analytics are discussed.

Symposium

Learning and Special Education

Analysing video recorded social interactions: The case of students with special educational needs

Keywords: Learning and developmental difficulties, Learning disabilities, Metacognition, Reading comprehension, Secondary education, Self-regulation, Social interaction, Special education, Video analysis

Interest group: SIG 15 - Special Educational Needs

Chairperson: Sabine Zorn, INS HEA, France

Discussant: Baruch Schwarz, Hebrew University of Jerusalem, Israel

Analysing social interactions taking place in learning contexts provides us precious elements to understand cognitive and socio-emotional processes involved in learning. With the help of video data collection, we can now explore learning situations in ecological contexts. In the field of learning disabilities, however, this method has been only rarely used, thus leaving a part of educational situations unexplored. In this symposium, our aim is to present the interests (and the limits) of research using video data collection regarding students with special educational needs and/or disabilities. The four papers included focus on different kinds of learning situations and students with different SEN and/or disabilities. The first communication will focus on behaviours spontaneously produced by students with profound intellectual and multiple disabilities during class time in a special institute. The second one will explore help interactions between students with an autism spectrum disorder and their teachers in lower secondary classrooms. The third paper uses video recordings to analyse cognitive and metacognitive behaviours of adults with moderate intellectual disability during an intervention focused at improving functional reading competences. The last presentation uses video to analyse the effects of an intervention focusing on cognitive, metacognitive and self-regulation behaviours in young students in regular education. Together, these four communications make novel contributions to understanding the socio-cognitive issues of learners with SEN and/or disabilities and suggest new directions for promoting video recording in educational contexts.

Students with profound intellectual and multiple disabilities: Spontaneous behaviors in classroom

Presenting Author: Esther Atlan, INS HEA, France; **Co-Author:** Danièle Toubert, INSHEA, France; **Co-Author:** Minna Puustinen, INS HEA, France

Despite the law of February 11, 2005, which guarantees the right for schooling for all students with disabilities, only around 13% of young people with profound intellectual and multiple disabilities (PIMD) benefit from part-time schooling in France. The schooling of students with PIMD is particularly challenging because it involves reconsidering curriculum, pedagogy, and assessment. In this observational study, which is part of a larger longitudinal research project, we focused on behaviors students with PIMD spontaneously (i.e., without being explicitly invited to do so) produce in the classroom. The participants were ten students with PIMD, aged 8 to 15, who attended two one-hour classes per week during one school year; in the classroom there were a total of five students with PIMD and two teachers as well as some other professionals (e.g., educator), if necessary. Three randomly selected classes (i.e., one per trimester) were filmed during the school year and analyzed. The results showed that all the students produced spontaneous behaviors. Some of them were exclusively aimed at exploring the material they had at their disposal, but most students also produced spontaneous behaviors addressed to the teachers, the other professionals and/or the other students. The analyses further showed that the teachers didn’t always react to, or take into account the students’ spontaneous behaviors; most of the time, they didn’t seem to notice those behaviors at all.

Help interactions between adolescents with an autism spectrum disorder and their teachers

Presenting Author:Sabine Zorn, INS HEA, France; **Co-Author:**Minna Puustinen, INS HEA, France

At school, learning typically occurs through some form of social interaction between teachers and students. Moreover, social interactions have been reported to be one of the best means to reach understanding of learning processes, school events, and, more generally, students' social and cultural integration (Mondada, 1995). Furthermore, difficulties in social interactions are considered one of the key characteristics—and one of the two diagnostic criteria—of people with an autism spectrum disorder (ASD; American Psychiatric Association, 2013). Within this context, examining social interactions in the classroom between teachers and students with ASD is a way to enhance knowledge on schooling of these students. However, despite legislative changes all over the world (e.g., 2005 law in France), this topic has been only rarely investigated. To fill this gap, we analysed both teacher and student-initiated interactions aimed to help lower secondary students with ASD with their schoolwork, in regular and resource classrooms. Eleven students with ASD and seventeen teachers were filmed in their everyday classroom activities. The results showed that help provided by the teachers was mainly simple (as opposed to specific; Gombert & Roussey, 2007): go and see briefly the students to check their work, repeat explanations, etc. Students with ASD sought help from their teacher during class; some of their requests reflected a self-regulated attitude while others did not. The impact of our results on the schooling of students with ASD will be discussed.

Metacognitive strategies and self-regulated learning in students with disadvantaged backgrounds

Presenting Author:Sophie Brandon, University of Geneva, Switzerland; **Co-Author:**Chloé Barthassat, University of Geneva, Switzerland; **Co-Author:**Hildalill Rojas, Université de Genève, Unknown; **Co-Author:**Christine Hessels-Schlatter, University of Geneva, Switzerland

Metacognitive competences are important in school learning and it has been shown that specific metacognitive interventions lead to improvements in solving school tasks (e.g., Dignath, Büttner, & Langfeldt, 2008; Hessels-Schlatter, Hessels, Godin, & Spillmann-Rojas, in press). The aim of this study is to develop metacognition, self-regulated learning (SRL) processes and strategies in children from disadvantages socioeconomic backgrounds in a natural classroom setting. The research took place in a regular class with students between 5 and 6 years old and is a part of a larger project in two mainstream schools in Geneva. The training consisted of 24 sessions of 45 minutes each. In the morning, strategies were introduced one at a time and the students learned to apply these in curriculum unrelated (CU) tasks (e.g., games). After the morning break, the learned strategies were transferred to curriculum related (CR) tasks (e.g., French and Maths). Self-regulation learning (SRL), metaknowledge, strategies as well as performance were evaluated by means of online measures (video recording and trace data) and offline measures (interviews). The preliminary results show that online measures proved to be more appropriate for the evaluation of SRL behaviors during task execution for this type of population and an improvement from pretest to posttest on strategies, SRL and performance was found.

Intervention aimed at improving reading comprehension in adults with intellectual disability

Presenting Author:Sophie Brandon, University of Geneva, Switzerland; **Co-Author:**Marco Hessels, University of Geneva, Switzerland

This study aimed at fostering functional reading in adults with moderate intellectual disability (ID). We focused on developing strategies, and cognitive and metacognitive processes in persons with ID, to improve decoding and text comprehension. Four adults with ID from institutions in Switzerland and France participated in the 30 to 35 intervention sessions of 50 minutes each. The tasks included vocabulary exercises and phonemic awareness, short texts with direct questions and logical inferences. Furthermore, a memory aid with strategies that were perceived useful was elaborated by participants, to assist them during the reading comprehension tasks. Mediation was aimed at fostering cognitive and metacognitive knowledge, flexible use of strategies as well as the development of self-determination and autonomy. The participants were encouraged to ask questions about their activities, to contextualize information, to make choices, to verbalize and to discuss the strategies used. All sessions were video recorded. The videos were transcribed verbatim to analyse the type of mediation (direct or indirect), the frequency and adequacy of strategies used (including the memory aid), meta-knowledge (of oneself, tasks and strategies) and motivational variables (self-efficacy and attributive style). Use of external memory strategies and performance were further analysed through written productions of the participants. The preliminary results indicate that the mediation and the memory aid allow the participants to progress in reading decoding and comprehension and to have a better understanding of their competences and deficits in this domain.

Symposium

Teaching and Teacher Education

What do (pre-service) teachers think, believe and feel regarding heterogeneous classrooms

Keywords: At-risk students, Attitudes and beliefs, Cultural diversity in school, Educational Psychology, Pre-service teacher education, Quantitative methods

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Charlotte Dignath, Goethe-University Frankfurt, Germany

Organiser: Mareike Kunter, Goethe-Universität Frankfurt, Germany

Discussant: Helenrose Fives, Montclair State University, United States

Increasing mobility combined with the United Nations' promotion of inclusive classrooms have worldwide led to increasingly heterogeneous student populations, bringing along new challenges for (prospective) teachers. This symposium's goal is to investigate beliefs that (prospective) teachers hold regarding heterogeneous classrooms as one important aspect of teachers' professional competence. All four studies examine (pre-service) teachers' beliefs towards heterogeneity and its relationship with other aspects of teacher competence by means of innovative methods, in order to present up-to-date evidence in this relatively young field of research. The symposium starts with an overview of research of the last fifteen years through a literature review on international studies on teacher beliefs towards heterogeneity. Next, a study with a large sample of pre-service teachers reports on the dimensional structure of teacher beliefs regarding heterogeneity as well as on relations between teacher beliefs and teacher self-efficacy to teach in heterogeneous classrooms. The third study presents evidence from an experiment with pre-service teachers investigating teachers' implicit attitudes toward students with educational needs in relation to their explicit attitudes towards inclusive education and their attitudes towards their ability to teach students with educational needs. The symposium concludes with a comparative study on the teacher attitudes of pre-, primary, and secondary school pre-service teachers towards inclusive education. This symposium contributes to the research field of teacher beliefs towards heterogeneity by investigating teacher beliefs in-depth with different methods and research approaches in order to derive implications for future research and teacher training.

Teachers' beliefs regarding heterogeneous classrooms – a systematic literature review

Presenting Author: Charlotte Dignath, Goethe-University Frankfurt, Germany; **Co-Author:** Mareike Kunter, Goethe-Universität Frankfurt, Germany

Migration movements, changing demographics, and the introduction of inclusion in world-wide schools are leading to an increasingly heterogeneous student population and thus a challenge for educational systems. How do teachers *feel* and *think* about this changing situation? Based on the model of determinants and consequences of teachers' professional competence (Kunter et al., 2013), this literature review seeks to give an overview of teacher beliefs regarding heterogeneous classrooms, as well as of relations of beliefs with other aspects of teacher professional competence (e.g., professional knowledge, self-efficacy), and with teachers' professional practice and with learning opportunities. The literature search among studies published since 2000 yielded almost 6.513 studies. 420 studies met the selection criteria and are coded elaborately with a systematic coding scheme. Preliminary analyses of the first 196 coded articles reveal inconsistent results regarding teacher beliefs, differing among dimension of heterogeneity. Moreover, positive beliefs turned out to be related to greater teacher self-efficacy. Although teachers seem to be willing to engage with issues concerning heterogeneity, they have a limited knowledge of the concepts, which in turn affects their efficacy negatively. In most studies, teachers' field experience is positively related with their beliefs, knowledge, and self-efficacy. Therefore, many researchers argue for field experiences to create preservice teachers' interactions with people from heterogeneous backgrounds, accompanied by the promotion of self-reflection in order to help student teachers to connect their experiences with theoretical knowledge about heterogeneity.

Teacher students' attitudes towards diversity: Conceptualizing and testing a multidimensional model

Presenting Author: Sabine K. Lehmann-Grube, University of Augsburg, Germany; **Co-Author:** Andreas Hartinger, University of Augsburg, Germany; **Co-Author:** Robert Grassinger, University of Augsburg, Germany; **Co-Author:** Hans Peter Brandl-Bredenbeck, University of Augsburg, Germany; **Co-Author:** Ulrike Ohl, University of Augsburg, Germany; **Co-Author:** Manfred Riegger, University of Augsburg, Germany; **Co-Author:** Markus Dresel, University of Augsburg, Germany

Increasing diversity of students poses new challenges for teachers along with growing demands to account for their differential needs with respect to learning. As one of several factors of teachers' competence to deal with diversity in the classroom their attitudes towards the variety of students' characteristics and backgrounds can be assumed to be relevant. A bi-factorial model of attitudes towards student diversity is proposed differentiating four types of diversity as attitude objects (i.e., pupils' capabilities, language skills, immigration and socio-economic backgrounds) and three attitude facets (i.e., general valence, benefit for students, costs for teachers). A study with 1354 teacher students was conducted to test the model. Confirmatory factor analyses supported the assumed factorial structure. Relations with external characteristics underscore the usefulness of the differentiations made in the proposed model. In detail, different attitude profiles were evident for different student subpopulations and different relations with transmission and constructivist beliefs as well as self-efficacy beliefs were observed for different attitude dimensions.

Stereotypes and attitudes towards students with special educational needs and inclusive education

Presenting Author: Ineke Pit-ten Cate, University of Luxembourg, Luxembourg; **Co-Author:** Mireille Krischler, University of Luxembourg, Luxembourg; **Co-Author:** Sabine Krolak-Schwerdt, University of Luxembourg, Luxembourg

Decisions concerning the educational instruction and pathways of students with special educational needs (SEN) may be affected by general stereotypes and associated teachers' attitudes. Both stereotypes and attitudes affect judgments and behavior and hence may be pivotal for the success of inclusive education. More specifically, stereotypes and attitudes can elicit positive or negative expectations and judgments, which in turn can enhance or limit the successful inclusion of

students with SEN in regular classrooms. The current study investigated stereotypes of and teachers' implicit attitudes toward students with SEN in relation to teachers' explicit attitudes towards inclusive education. Results show that teachers hold ambivalent views of students with learning difficulties (i.e. low competence, high warmth), whereas students with behavioral problems are perceived as neither particularly (in)competent nor warm. These stereotypes matched teachers' implicit attitudes to the extent that implicit attitudes towards students with learning difficulties were more negative than towards students with behavioral problems. Although teachers expressed positive attitudes towards the benefits of inclusion they reported negative attitudes in regards to their ability to teach students with SEN. No associations were found between stereotypes and implicit attitudes. Implicit attitudes towards students with SEN were also not associated with explicit attitudes towards inclusive education. The warmth dimension of stereotype was however positively correlated with perceived ability to teach students with SEN. That is, perceived ability to successfully teach these students may rely on perceptions of these students' alleged sociability.

Australian Pre, Primary and Secondary School Pre-Service Teacher Attitudes to Inclusive Education

Presenting Author: Christopher Boyle, University of Exeter, United Kingdom

This study considered Australian pre-service teachers' attitudes toward the inclusion of additional support needs (ASN) students at all three levels of schooling (pre, primary, and secondary school). The study used a sample of 640 subjects whose attitudes were investigated using the Teacher Attitudes to Inclusion Scale Adapted (TAISA). The significant results of the study indicated secondary school focused pre-service teachers displayed less positive attitudes toward inclusion than pre-service teachers with a primary school focus. When considering the impact of additional variables such as previous special educational training and year level of enrolled study, significant differences in attitudes toward inclusion emerged across pre, primary and secondary school pre-service teacher cohorts.

Symposium

Teaching and Teacher Education

Becoming a teacher - Austrian, Estonian and Finnish teacher students' perceptions

Keywords: Attitudes and beliefs, Comparative studies, Mixed-method research, Pre-service teacher education, Reflection, Teacher Professional Development

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Eeva Kaisa Hyry-Beihammer, University of Education Upper Austria, Austria

Discussant: Erika Löfström, University of Helsinki, Finland

During teacher education, student teachers have to develop their understanding of themselves as teachers, thus their teacher identities. Teacher identity can be explored through variety of theoretical and methodological perspectives. Our symposium focuses on the teachers' beliefs about (good) teaching and learning and the development of teachers' personal practical theories during the teacher education program. The symposium papers are presented in the context of different teacher education programs in Austria, Estonia, and Finland. All papers focus on researching of how to become a teacher, but the methodological approaches are different. Our theoretical aim is to uncover differences as well as similar patterns of teacher students' beliefs, role perceptions and personal practical theories across the three countries. Based on the results, the implications for teacher education are discussed in the papers and in the final discussion of the symposium.

Austrian student teachers' beliefs about (good) teaching and learning as a part of their PPTs

Presenting Author: Eeva Kaisa Hyry-Beihammer, University of Education Upper Austria, Austria; **Co-Author:** Petra Hecht, Pädagogische Hochschule Vorarlberg, Austria; **Co-Author:** Jan Boehm, University of Education Upper Austria, Germany

This paper focuses on Austrian student teachers' beliefs about good teaching at the beginning of their teacher studies. Studies show that prospective teachers' beliefs influence what is learned during their studies, but also that teacher education programs have an impact on student teachers' beliefs about the qualities of good teaching (Levin, 2008). We ask, 'What do these student teachers believe about good teaching and learning, and how do these beliefs inform their personal practical theories of teaching? The data consists of narrative interviews with 12 Austrian primary-school student teachers and 10 Austrian secondary-school student teachers. The students represent the diversity of student teachers in Austria with regard to age, gender, national background, and previous teaching experience. Following the narrative approach (Riessman, 2008), the aim is to listen to the student teachers' "voices" (Elbaz-Luwisch, 2005) through their stories of personal experience. Methods of content analysis and narrative analysis (Riessman, 2008) are used to investigate student teachers' beliefs about good teaching and learning.

Becoming a teacher in Estonia: perceptions of roles, beliefs and tensions in different programmes

Presenting Author: Tiina Anspal, University of Tartu, Estonia; **Co-Author:** Äli Leijen, University of Tartu, Estonia

This paper draws on three different studies carried out in Estonian context that aimed to explore teacher identity development during teacher education - across different study years and study programmes. Teacher identity is researched through student teachers image of themselves as teachers, teachers role and beliefs. Also worries, gaps and tensions that

arise in the dialogue between ideals and experiences were explored in the three studies that form the basis of this presentation. Combining the results of the studies indicate how the idealistic views of themselves as teachers and teachers role change with experiences during teaching practice. Worries, fears and tensions increasingly enter to the picture as student teacher understand the difficulty in achieving their high ideals. Analysis of the worries and tensions indicate that time-management issues should be addressed more during teacher education, especially in connection with teaching practice. Our data also suggest that subject teachers and primary teachers views and beliefs on teachers role tend to be different with primary teachers emphasising especially teachers' role as pedagogue and didactics specialist and subject teachers emphasising the role of the teacher as subject specialist and didactic specialist.

Finnish teacher students' beliefs: Case of University of Helsinki

Presenting Author:Katriina Maaranen, University of Helsinki, Finland; **Co-Author:**Katriina Stenberg, University of Helsinki, Finland; **Co-Author:**Liisa Karlsson, University of Eastern Finland, Finland; **Co-Author:**Harri Pitkaniemi, University of Eastern Finland, Finland

This study investigates teacher students' personal practical theories in the University of Helsinki, Finland. The study combines data from first and fourth year teacher students. The students constructed their personal practical theories, which are defined in this study as *pedagogical beliefs that guide their classroom actions*, by writing statements indicating *what is important to them is teaching*. The first year students' PPTs showed that when student teachers begin their teacher education, the majority of positions concern didactical issues, that is, how to promote pupils' studying and learning processes. In the fourth year students' PPTs three main categories were found: *the foundations of good teaching, the teacher*, and *the teacher's daily work*. The analysis of the statements shows that the notions of good teaching are very idealistic. The role of teacher education is considered in the process of promoting development of student teachers' teacher identity during their studies, and that it is good to have high aims and values for teaching, although in reality some of them might be difficult to achieve. We consider it important that the teachers are aware of their own values and beliefs, and they also need to be highly educated in order to be able to make their own pedagogical decisions and justify them.

Invited Symposium

Educational Policy and Systems

Community Led Educational Reform: co-defining futures, out of school learning & poverty proofing

Keywords: At-risk students, Citizenship education, Collaborative Learning, Cooperative / collaborative learning, Cultural diversity in school, Mixed-method research, Out-of-school learning, Parental involvement in learning, Secondary education, Social aspects of learning and teaching

Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings

Chairperson: Liz Todd, Newcastle University, United Kingdom

Organiser: John O'Neill, Massey University, Nicaragua

Discussant: Rocio Garcia-Carrion, University of Deusto, Spain

This symposium aims to explore different aspects of community led educational reform. Some schools make community led reform a cornerstone of their institution – but bottom-up development is relevant for all schools. The first paper (Karen Laing and Liz Todd) researches the meaning that children, parents and teachers give to learning, both inside and outside of school, through choices about after school activities. This paper analyses the out of school activities of 11,762 young children using data from the Millennium Cohort Study (MSC). The second paper (Debbie Ralls) looks at what engagement means in an English co-operative school, drawing on the concept of relational engagement. Claire Forbes, in the third paper, explores a possible process for bottom-up reform, the co-creation of a future agenda involving young people and professionals, and supported by an assets map. In the final paper, Laura Mazzoli Smith and Liz Todd explore the involvement of young people, parents, teachers and governors in change with the aim of no longer, in schools, stigmatising

children who are living in poverty.

A range of social justice issues are addressed. Some of the questions asked include what does 'engagement' in school mean? What do we know about the meanings that the community gives to education? What are the reasons for bottom up development of services? What methods can we use for members of the school community to work together? This series of papers from Manchester and Newcastle Universities explores these questions.

Out of school hours activities: looking at school staff, parent and pupil meanings and theories

Presenting Author:Karen Laing, Newcastle University, United Kingdom; **Co-Author:**Liz Todd, Newcastle University, United Kingdom

The first paper (Karen Laing and Liz Todd) explores the meaning that children, parents and teachers give to learning, both inside and outside of school, through choices about after school activities. The implications of the meanings given to learning, especially out of school activities, for community led educational reform are considered. The out of school activities of 11,762 young children aged 5-11 were looked at using data from the Millennium Cohort Study (MSC). The possible association with attainment was considered by linking the MCS to the National Pupil Database (NPD). Interviews were held with head teachers, teachers, parents, pupils and activity providers in 10 schools. A number of differences are found in the prevalence of activities between rich and poor. The association of these activities with attainment for different groups of children is considered in terms of implications for policy and practice. Comparing economically disadvantage children with those who were not in the MCS, there was little difference in attendance of breakfast clubs or after school clubs but poorer children attended more religious activities after school and were less likely to have extra tuition or to attend a sports club. Attending after school clubs was associated with attainment for disadvantaged children. This research explored the theories that might account for the findings. The meanings given to activities by parents contributed to a richer understanding of the scholarisation of childhood. Implications for community led educational reform are discussed.

Forms and Understandings of Engagement in a Co-operative School Setting

Presenting Author:Deborah Ralls, University of Manchester, United Kingdom

The second paper (Debbie Ralls) looks at what engagement means in an English co-operative school. Drawing on Warren's (2009) concept of relational engagement, staff, parents, students and community members were asked about their engagement experiences. Engagement in action was observed to compare with the accounts given by teachers. This study focused on engagement between a co-operative school and its key stakeholders: the students, their parents and the community: Staff, parents, students and community members were asked about their engagement experiences. Engagement in action was observed to compare with the accounts given by staff. The study was thus able to take account of any links between the groups whilst acknowledging contrasts in approaches or understandings and to query why such differences may have been occurring.

Analysis looked at the extent to which activities were seen as engagement with rather than doing to. It was found that the co-operative school governance did indeed give more potential for democratic relational engagement. However, parents and the community tended to be viewed as outsiders and so engaged with differently to students. Co-operative schools face a dilemma - how to frame a more *relational* understanding of engagement in an English Education policy landscape of *doing to*? The difficulty in *doing with* stakeholders when current English Education policy seeks *to do to* schools, encouraging parents and community to do the same through the marketisation of schools and the rhetoric of freedom and choice.

Reform from the Bottom-Up. A grass-roots, assets-based approach improving young people's outcomes

Presenting Author:Claire Forbes, University of Manchester, United Kingdom

Claire Forbes explores a possible process for bottom-up reform, the co-creation of a future agenda involving young people and professionals, and supported by an assets map. This paper considers the diverse and multiple realities of young people's lived experiences within areas of significant socio-economic disadvantage, in order to suggest opportunities to develop policy interventions that are contextually appropriate. Asset Based Community Development (ABCD), a grass roots process developed in the United States, where existing but often unrecognized community assets are mapped, provides a possible means of making sense of the places, spaces and people that children in our most marginalised communities have reason to value and why. 10 student researchers carry out focus groups with 230 young people aged 11-15. Young people are revealed as rich in social capital and rarely making use of professional led services, instead identifying other enabling assets such as family, friends and social media. A student created assets map is used to facilitate work between the student researchers and professionals from 15 organisations to develop a co-defined future agenda.

Poverty proofing the school day: bottom-up reform a potential for real change

Presenting Author:Liz Todd, Newcastle University, United Kingdom

Laura Mazzoli Smith and Liz Todd explore the involvement of young people, parents, teachers and governors in change with the aim of no longer stigmatising children who are living in poverty. Our research investigates the use of Children North East's audit tool with 20+ primary and secondary schools to 'poverty proof' the school day. Methods included: observations of the process of working with young people in two schools; interviews with head teachers Children North East staff, and a Local Authority Advisor; observation of a staff training session; analysis of all parental, staff and governor

questionnaire data; and analysis of all school action plans. This allowed the research team direct access to the process and/or the views of staff in six of the 13 schools that have participated so far and indirect access to data from all. Similarities were found in the ways that schools inadvertently stigmatised pupils living in poverty and some imaginative solutions have been devised. These included extensive issues around ability/behaviour and setting, bullying, uniform, exams, extra-curricular activities, support for parents and families, food, homework, resources, transport, tutor groups/support for pupils, and school leadership and governance. This paper discusses the audit as a bottom up process with a potential for real change in schools. The action plans provide schools with recommendations to reduce stigma and cost within their school. However a number of the issues covered are arguably issues that local authorities, government and also society must address.

Session D 26

30 August 2017 10:15 - 11:45

Linna - K103

Invited Symposium

Motivational, Social and Affective Processes

Peer relations within schools: Associations with students' motivation and academic achievement

Keywords: Achievement, Educational Psychology, Emotion and affect, Goal orientation, Motivation, Peer interaction, Primary education, Reading comprehension, Social aspects of learning and teaching

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Maria Tulis, University of Augsburg, Austria

Chairperson: Marion Reindl, University of Augsburg, Germany

Discussant: Jari-Erik Nurmi, University of Jyväskylä, Finland

Peers form an important social context that impact students' academic development. The composition of peer relations ranges from dyadic friendships, social networks within classrooms to broader relational structures within the school. Addressing different kinds of relationships and both students' and teachers' perspectives, this symposium aims to bundle recent work on peer relations within schools, designed to further our understanding of (a) direct and indirect effects on students' academic achievement (paper 1, 2 and 3), (b) the relative contributions of selection and socialization processes (paper 2), and (c) teachers' diagnostic competence to identify peer relations within their classes (paper 4). With every paper presented in this symposium we will gain deeper insights into the peers' impact on students' motivation and achievement, and how to help teachers to utilize this social resource. The first paper (Reindl, Tulis & Dresel) examines the best friends' impact on students' domain specific emotions and achievement in mathematics and English. The second paper (Kiuru et al.) focuses on peer selection and influence effects in children's reading skills. The third paper (Makara, Karabenick & Epstein) analyzes school peer social networks and their predictive value for academic achievement. The fourth paper (Harks, Zander & Hannover) complements the symposium with findings regarding teachers' perceptions of peer networks. Finally, our discussion will elaborate implications for theory and educational practice. In keeping with the conference theme "Education in the crossroads of economy and politics", the symposium highlights the importance of social relatedness—also, or even particularly, in the school context.

Associations between friends, academic emotions and achievement

Presenting Author: Marion Reindl, University of Augsburg, Germany; **Co-Author:** Maria Tulis, University of Augsburg, Austria; **Co-Author:** Markus Dresel, University of Augsburg, Germany

Based on emotional contagion theory, this study focuses on the effects of best friends' domain-specific academic emotions (enjoyment and boredom) on students' academic emotions, and their subsequent achievement. Based on a sample of 556 German students, structural equation models showed a positive effect of best friends' enjoyment on students' enjoyment. Best friends' enjoyment indirectly influenced achievement through students' enjoyment (indirect effect), whereas best friends' boredom had no effect on students' boredom and achievement. The results were consistent over two subjects (mathematics and English as a foreign language). Results will be discussed of increasing influence of friends as role models during puberty and whether the best friend can be identified as a resource or as a risk factor.

Peer Selection and Influence in Children's Reading Skills: A Social Network Approach

Presenting Author: Noona Kiuru, University of Jyväskylä, Finland; **Co-Author:** Dawn DeLay, Arizona State University, United States; **Co-Author:** Brett Laursen, Florida Atlantic University, United States; **Co-Author:** William Burk, Radboud University Nijmegen, Netherlands; **Co-Author:** Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:** Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:** Jari-Erik Nurmi, University of Jyväskylä, Finland

This longitudinal study investigated (a) the extent to which children select new peers based on similarity in reading skills, and (b) the extent to which children are influenced by their peers' reading skills. The sample consisted of 1,003 Finnish children in Grades 1 to 4, for whom reading fluency and text comprehension were assessed. The same children were interviewed with respect to their self-concept of ability in reading at the end of kindergarten. The results of social network analysis showed that children had a tendency to choose new friends based on earlier similarity in reading fluency, but not in reading comprehension. Furthermore, children became more similar across time to their friends on reading fluency and reading comprehension. Children with both high self-concept of ability in reading and high reading fluency were particularly

prone to positive peer influence in regards to their reading fluency.

The Contribution of “Bonding” and “Bridging” Peer Relations to Students’ Academic Achievement

Presenting Author:Kara Makara, University of Glasgow, United Kingdom; **Co-Author:**Stuart Karabenick, University of Michigan, United States; **Co-Author:**Alanna Epstein, University of Michigan, United States

Peer relationships are an important component of the school context that impact students’ academic development. Using social network analysis, we examined how bonding (banding together in a close-knit group) and bridging (having social connections across groups) dimensions of students’ peer relations: (a) predict academic achievement and (b) are predicted by students’ social goals. Three measures of students’ centrality in the school peer social network (indegree, eigenvector centrality, and betweenness) were used to capture different dimensions of students’ peer relations. Social goals were conceptualized by Achievement Goal Theory, specifically social development, demonstration-approach, and demonstration-avoidance goals. 852 students were surveyed three times during a school year in order to assess their social goals, peer social networks, and academic achievement. Path-analytic models were used to estimate the longitudinal relations between social goals, the three dimensions of peer relations, and academic achievement. The results indicate that both bonding and bridging elements of peer relations positively predicted students’ academic achievement at the end of the year. There was consistent support for the benefits of social development goals on academic achievement, partially mediated through the dimensions of students’ peer relations, and a maladaptive effect of demonstration-avoidance goals on achievement, fully mediated by lower centrality in the peer network. Strengths of the study include the longitudinal design among the variables and the multiple indicators of students’ centrality within the school network to capture some of the complexity in peer relations. Theoretical and educational implications will be discussed.

Judging students’ peer-networks in class: A new facet of teacher diagnostic competence?

Presenting Author:Marvin Harks, Freie Universität Berlin, Germany; **Co-Author:**Lysann Zander, Freie Universität Berlin, Germany; **Co-Author:**Bettina Hannover, Freie Universität Berlin, Germany

Accuracy in teachers’ judgment of students’ competence is an important facet of teacher competence. We investigated an additional dimension of diagnostic competence: the extent to which teachers adequately perceive their students’ connectedness in the peer-network of the classroom. Teachers who are aware of how well individual students are integrated should be better at preventing social exclusion and at making use of the central position of highly connected students to foster cooperation and a positive learning climate. Actual peer-networks were measured using sociometric data, with every student indicating the peers he or she likes most. Teachers were asked to answer the same question for all students of their class (teacher perceived peer-network). Students’ were additionally asked to nominate peers who are liked most by others (student perceived peer-network). Besides the actual peer-network data, several motivation- related characteristics of the individual students were used as predictors of teacher and student perceived peer-networks. Teachers’ perceptions were strongly predicted by actual peer-networks. In addition, teachers perceived students the more connected the stronger their grades were and the more effort they invested at school. Students’ perceptions were also most strongly predicted by actual peer-networks. In addition, students’ perceived their peers to be the more connected the better their grades were and the more importance they assigned to good looks. Results suggest that teachers are quite good at judging students’ connectedness and that their diagnostic competence could be further enhanced if they knew about factors influencing (appearance) or not influencing (effort investment) students’ perceptions of peer-networks.

Teaching and Teacher Education

Up-To-Date Approaches for Practice Related Opportunities to Learn in Teacher Education

Keywords: Cognitive development, Collaborative Learning, Communities of practice, Comparative studies, Conversation / Discourse analysis, Experimental studies, In-service teacher education, Peer interaction, Pre-service teacher education, Qualitative methods, Teacher Professional Development, Workplace learning

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Inger Marie Dalehefte, University of Agder, Norway

Organiser: Annelies Kreis, Zurich University of Teacher Education , Switzerland

Organiser: Tina Seidel, Technische Universität München (TUM), Germany

Discussant: Paulien Meijer, Radboud University Nijmegen, Netherlands

Reflected teaching experience is considered to offer crucial opportunities to learn during initial teacher education, and professional development with in-service teachers. There is a long tradition of research on respective support processes and outcomes. The invited symposium of the SIG 11 combines four presentations about innovative approaches for practice related opportunities to learn in teacher education. Contribution 1 considers pre-service and mentor teachers as *peers* who work and learn together in local communities of practice in partner school contexts. It explores how competences are deepened and expanded while coping with real problems of everyday working life. Study 2 focuses with a cross-cultural perspective (East Asia, Britain) on cognitive strategies of expert, beginning, and novice teachers with respect to challenging

everyday situations. Participants differ in their verbalized thoughts as they consider possible actions for difficult classroom scenarios. Study 3 aims to test a practice-related approach to kindergarten teacher professional development for instructional support strategies by including gaze behavior into coaching. Measures of instructional quality and of gaze recordings from natural classroom settings are analyzed. Contribution 4 explores the quality of peer coaching planning dialogues. In the course of a bi-national experimental intervention study characteristics of spontaneous co-planning between student teachers is compared with co-planning according to content-focused peer coaching as a framework for productive lesson planning dialogues. The contributions will be critically discussed with respect to the applied methodological approaches, and their potential as opportunities for practice situated professional development of novice and expert teachers.

Peer-to-Peer-Mentoring in communities of practice: A partnership of pre-service and mentor teachers

Presenting Author:Urban Fraefel, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Nils Bernhardsson-Laros, University of Applied Sciences Northwestern Switzerland, School of Teacher Education, Switzerland; **Co-Author:**Kerstin Baeuerlein, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Sebastian Jünger, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

The intervention study “Partner schools for professional development” considers pre-service and mentor teachers as peers who work and learn together in local communities of practice and thus deepen and expand their knowledge and increase their professionalization. Instead of focusing on mentor teachers' evaluative guidance of pre-service teachers, the approach supports collaborative learning while coping with real problems of everyday working life. Our findings indicate that an intensified cooperation among peers comes about (1) with a greater willingness from student teachers to activate and to link knowledge resources, (2) with higher quality teaching while co-teaching, (3) with opportunities to further professional development in mentor teachers.

What's Going on in a Teacher's Mind? How Teachers Processes Difficult Classroom Scenarios

Presenting Author:Lisa Kim, University of York, United Kingdom; **Co-Author:**Robert Klassen, University of York, United Kingdom

Teachers are confronted with challenging situations at school everyday. With years of experience, teachers become more effective in responding to these situations. However, the developmental trajectory of how they cognitively process these situations is relatively unknown although this information can inform professional developmental practices and teacher education program selection practices. Our three-part mixed method studies use a think-aloud methodology, whereby participants verbalise their thoughts as they determine how they would respond in difficult classroom scenarios. Studies 1 and 2 examine the cognitive processing differences between expert, beginner, and novice teachers without and with pre-existing response options, respectively. Study 3 examines the cognitive processing differences between East Asian and British students to determine the cross-cultural generalizability of the findings from Studies 1 and 2. Quantitative analyses indicate that teachers at different stages of their career do not differ in their confidence of the accuracy of their responses. However, qualitative analyses indicate that the three groups differed in their cognitive strategies, content, and scope. Furthermore, East Asian students seemed to slightly differ in their approaches in processing the scenarios than British students. These three studies indicate that teachers do develop in their cognitive processing over their career, which can hence be used to inform culturally contextualised teacher professional developmental and selection practices.

Teachers' Gaze Recording: An Opportunity to Improve Teachers' Instructional Support Strategies?

Presenting Author:Antje von Suchodoletz, New York University Abu Dhabi, United Arab Emirates; **Co-Author:**Irene Skuballa, New York University Abu Dhabi, United Arab Emirates

Teachers across all grade levels struggle with providing high-quality instructional support. Teachers' gaze behavior may provide a potential informative pathway to reflect on teaching practices. The study aims to test a practice-related approach to kindergarten teacher professional development by including gaze behavior into coaching. Teachers are assigned to one of two conditions, *Instructional Support Strategies with Coaching* (ISS plus C) or *Instructional Support Strategies without Coaching* (ISS w/o C). We expect to pre-/post-intervention increases in instructional support, favoring teachers in the ISS plus C condition. Participants are 20 kindergarten teachers, randomly assigned to the conditions. Pre- and post-intervention data include measures of instructional quality (assessed with the CLASS Pre-K) and gaze recordings in natural classroom settings. Pre-intervention data suggests substantial variability in instructional support across classrooms. On average, the level of instructional support in the sample was low ($M = 2.52$, $SD = 0.83$). Results will be discussed with regard to innovative strategies to support teachers in reflecting on classroom interactions and enhancing skills needed to provide intentional and effective instructional activities that in turn will result in positive student outcomes.

Characteristics of Spontaneous Co-Planning vs Content-Focused Peer Coaching Between Student Teachers

Presenting Author:Annelies Kreis, Zurich University of Teacher Education, Switzerland; **Co-Author:**Stefanie Schnebel, University of Tübingen, Germany

Expert-novice mentoring is a traditional element in designing intentional opportunities to learn during field placements, and has been shown as fruitful for student teacher learning. Additionally, structured *peer coaching* can be expected to offer further opportunities to learn (OTL). In an interdisciplinary, mixed-methods, and bi-national project, we studied the outcomes of an intervention with Content-focused Peer Coaching (CPC) on student teacher interaction, learning and competence. CPC aims to foster a mode of co-constructive interaction, elaboration, and the content in lesson planning

dialogues between peers. This study explores, whether and how an ecologically valid training for CPC can enrich planning dialogues in comparison with spontaneous peer coaching. Student teachers of an intervention group (N=65) were trained for CPC as part of their regular study courses. After the training they were asked to plan a Biology lesson with a colleague. Participants of the control group (N=54) were assigned the same task, but did not have a CPC-training beforehand. Planning dialogues were videotaped, transcribed, and analyzed with pragma-linguistic discourse analysis. Results show that teacher students of the intervention group adopted the core features of CPC such as co-constructive elaboration. They discuss a broader variety of issues, and spend more time doing so than their colleagues of the control group. The study gives insights into possible processes, gains and limitations of structured/spontaneous peer coaching as a complementary OTL during school-based initial teacher education.

Invited Symposium

Assessment and Evaluation

Navigating the interpersonal eddies of peer assessment

Keywords: Assessment methods and tools, Collaborative Learning, Peer interaction, Social aspects of learning and teaching

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Jan-Willem Strijbos, University of Groningen, Netherlands

Organiser: Jan-Willem Strijbos, University of Groningen, Netherlands

Organiser: Ernesto Panadero, Universidad Autonoma de Madrid, Spain

Discussant: Marieke van der Schaaf, Utrecht University, Netherlands

Peer assessment (PA) is an interpersonal process where students judge a performance of a peer (or multiple peers) quantitatively (scores or grades) and/or qualitatively (written or oral feedback), and stimulates students to share responsibility, reflect, discuss and collaborate with their peers. However, PA can simultaneously be an additional source of bias. Interpersonal variables (e.g., trust in the other, psychological safety, cooperativeness, reliability, etc.) and interpersonal relations (e.g., friendship, anonymity, etc.) can (a) mediate/moderate the CL processes, and thereby (b) act as another source of bias and reduce reliability and validity. This symposium presents four contributions that navigate the interpersonal eddies of peer assessment by (a) examining key sources of potential bias such as emotions, trust, friendship, PA format, etc., and (b) examining instructional design features and statistical solutions that might mitigate potential bias.

Reviewing the interpersonal variables that play a role in peer assessment

Presenting Author: Ernesto Panadero, Universidad Autónoma de Madrid, Spain

This narrative review analyzes the evidence on the interpersonal factors that influence peer assessment. All the evidence published since the first review on the topic, (van Gennip, Segers & Tillema, 2009) was included, a total of 26 articles. Searches in PsycINFO were conducted using the following combinations of key terms: PA + 'interpersonal'; + 'motivation'; + 'emotion'; + 'psychological safety'; + 'friendship'; + 'value diversity'; + 'value congruence'. Studies needed to fulfill three inclusion criterions: (1) empirical evidence of the effect of PA on social or human factors or vice versa had to be available; (2) the study had to be published and peer-reviewed, including doctoral dissertations; and (3) articles had to be available in English. From the reviewed empirical evidence, ten themes covered by previous research on interpersonal PA factors emerged: motivation, emotion, social factors, friendship, trust in the self as assessor, trust in the other as assessor, fairness/(dis)comfort, psychological safety, value diversity/congruence, and interdependence. These themes were further grouped into three categories namely: intra-individual factors, inter-personal aspects and cognitive aspects. There are two main conclusions. First, formative uses of PA decrease the interpersonal problems that PA elicit in students. Second, PA should not be implemented as a "side activity" but needs to be central to the curriculum to fulfill formative purposes if these were to be central to the teachers' pedagogical intentions.

Anonymity as instructional scaffold in peer assessment: Effects on peer feedback quality

Presenting Author: Tijl Rotsaert, Ghent University, Belgium; **Co-Author:** Ernesto Panadero, Universidad Autónoma de Madrid, Spain; **Co-Author:** Tammy Schellens, Ghent University, Belgium

Although previous research has indicated that providing anonymity is effective to create a safe peer assessment (PA) setting, continuously ensuring anonymity prevents students from experiencing genuine two-way interactive feedback dialogues. The present study investigates how fading anonymity over time can overcome this problem. 46 Bachelor students in Educational Studies participated in multiple PA cycles in which groups of students assessed each other's work. In this study students' evolution in peer feedback (PF) quality was measured. The content analysis of the PF messages revealed that the quality of the PF increases in the anonymous phase and that over time the PF quality in the consecutive non-anonymous sessions was of similar quality. Findings suggest that anonymity can be used as a valuable scaffold to ease students' importance level towards anonymity and their associated need for practice.

Inferring individual scores from group scores via peer assessment: Part 1 – Methodological review

Presenting Author: Jan-Willem Stribos, University of Groningen, Netherlands; **Co-Author:** Dominique Sluijsmans, Zuyd University of Applied Sciences, Netherlands; **Co-Author:** Karsten Stegmann, Ludwig-Maximilians-Universität (LMU), Germany

When asked about their experiences with Collaborative Learning (CL), students typically mention (a) unequal participation by students—up to free-riding, and (b) dissatisfaction with the assessment of CL. In fact, as inequality of participation increases – especially when there is a free-rider in a group – the call for diversified assessment intensifies. The topic of assessment has remained implicit in most research on CL, whereas it received some attention in research on Assessment and Evaluation. This contribution focuses on the challenge of juggling group-level and individual-level assessment information. More specifically, we conducted a methodological review on the use of Peer Assessment (PA) to infer individual scores from group scores. Twenty-eight studies were analysed with respect to the PA practices and formulae used. The findings reveal that (a) most studies reported the use of ‘group mean centering’ and some suggested revisions by considering PA accuracy or cheating, (b) most studies used a rating format but these varied strongly in number of categories, levels and values, (c) most articles concerned an empirical study or included empirical data in addition to a formula or methodological critique, (d) although contested in the literature more than half of the articles included SA in the computation, and (e) all articles reflected a lack of flexibility in terms of relative weighting of criteria.

Inferring individual scores from group scores via peer assessment: Part 2 – A simulation study

Presenting Author: Jan-Willem Stribos, University of Groningen, Netherlands; **Co-Author:** Karsten Stegmann, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:** Dominique Sluijsmans, Zuyd University of Applied Sciences, Netherlands

Despite considerable research on instructional techniques to facilitate equal contribution to Collaborative Learning (CL), students regularly complain about a lack of effort by one or more group members and as a result students call for differentiated assessment – in particular in the case when a only a group score is awarded. Peer Assessment (PA) is a specific form of collaboration, aligns quite naturally with CL and can enhance positive interdependence by confirming and/or enabling (re)alignment with the shared goal and individual accountability by making members’ below, mean or above average contribution to CL visible. However, PA can simultaneously be an additional source of bias. Interpersonal variables (e.g., trust in the other, psychological safety, cooperativeness, reliability, etc.) and interpersonal relations (e.g., friendship, anonymity, etc.) can (a) mediate/moderate the CL processes, and thereby (b) act as another source of bias and reduce reliability and validity. Despite a considerable number of studies that applied PA for this purpose, the methodological review in Part 1 also highlighted serious limitations. This contribution discussed an attempt to revise the formula, while also incorporating the refinements that were suggested by various authors. A simulation study is reported to illustrate the robustness of the revised formula.

Cooperative learning new software for the workplace – following work functions or work processes?

Keywords: Achievement, Cooperative / collaborative learning, Student learning, Workplace learning

Presenting Author: Mandy Hommel, TU Dresden, Germany

To meet demands of an effective way to learn and successfully apply new software for the workplace it is necessary to know which learning environment supports the learners best. This study investigates how the learning of the human resources software SAP ERP HCM is supported within a formal workshop setting by different conditions. Either the learning process follows a function (software structure menu), or process oriented conception (usual workaday processes), in a single learning or partner learning (dyadic) condition. Data of knowledge pre- and post-tests were gathered. Additionally, questionnaires about generalised learning strategies and learning experiences in open learning settings were used to control influences from these factors. The learning conditions seemed to influence the learning results differently. A superiority of learners in the process oriented dyadic condition was shown especially regarding tasks that demand remembering of concepts and procedures. For tasks demanding ‘application’ and ‘analysis’ the learning groups do not differ significantly. From the results it could be cautiously concluded, that dyadic learning with respect to the workaday processes supports the learning more than function or process oriented single learning, and function oriented dyadic learning.

The role of mentoring in early career physics teachers' professional identity construction

Keywords: Physical Sciences, Qualitative methods, Self-efficacy, Teacher Professional Development

Presenting Author:David Cameron, The Institute of Physics, United Kingdom; **Co-Author:**Anna Grant, AlphaPlus Consultancy Ltd, United Kingdom

This paper will report on the findings from theoretically informed empirical research on the effectiveness of a project providing subject-specialist mentoring for early career physics teachers in England, and the implications of these findings for the project's development and continued support and funding by government policy makers. The purpose of the research was to evaluate the extent to which the project achieved its objectives: to improve early career physics teachers' (ECTs) subject knowledge, pedagogical skills and confidence; and to support the ECTs' professional identity construction. The research explored the areas in which mentoring made a positive difference to participants' professional practice and identity, and reported on the project's limitations. The findings from the research led to a developmental dialogue between project managers and evaluators, based on an open relationship of trust and honesty, which aimed to identify the assumptions which underpinned the project, its intended and evidenced outcomes, and lead to propositions for refining both the delivery of the project and the ongoing evaluation strategy. By clarifying and strengthening the project in this way, a compelling case could be made to policy makers in the UK government for the importance of this work in supporting ECTs, the confidence of policy makers was cultivated and continued funding was secured beyond the intended endpoint of the project.

Developing a scalable lecturer professional development framework

Keywords: Communities of practice, Conceptual change, Design based research, Teacher Professional Development

Presenting Author:Thomas Cochrane, Auckland University of Technology, New Zealand; **Co-Author:**Vickel Narayan, Auckland University of Technology, New Zealand

Most tertiary teachers are motivated self-directed learners, but tend to teach how they were taught. Traditional approaches to professional development (PD) often lack tangible outcomes. Conceptual shifts in teaching practice are more likely to occur when teachers themselves act as learners within new pedagogical paradigms. The paper proposes a new model of PD as a network of communities of practice within a cMOOC, where sustained collaborative engagement with innovative teaching practice is recognised via CMALT (Certified Member of the Association for Learning Technologies) accreditation. CMALT has a similar standards-based framework to the Higher Education Academy (HEA) but emphasises the use and critique of learning technology. Recent evidence illustrates the potential of cMOOCs for effective PD. The paper proposes the development a cMOOC that leverages national and international collaboration and innovative teaching expertise, providing a pathway for participants' CMALT portfolios as evidence of new modes of practice and enhanced student outcomes.

A structural approach to the first ten natural numbers

Keywords: Early childhood education, Mathematics, Numeracy, Teaching / instruction

Presenting Author:Anna-Lena Ekdahl, Jönköping University, Sweden; **Co-Author:**Camilla Björklund, University of Gothenburg, Sweden

A structural approach to the first ten natural numbers

Pre-school teachers' different ways of handling the artefact 'snake-game'

X & X

Abstract

The aim of this paper is to report some findings from an analysis of an intervention study included in the FASETT-project. FASETT is based on the ideas of Neuman (1987) and Marton's (2015) theoretical conjecture, which says that children need to experience the ten natural numbers in terms of critical aspects, such as 'manyness' and part-whole aspects to learn to solve arithmetic problems.

The empirical data consists of video observations from nine pre-school teachers in a three-month time period where an activity called the 'snake-game' was conducted with 5-year-old children. 39 of these recordings were analyzed, focusing on how the teachers, in their pre-school groups, manifested the theoretical ideas of the artefact '5- and 10-snake'. The results point to differences in teachers' enactment of the ideas included in the activity and their improvement over time, for example in terms of how the teachers enacted the idea of finger patterns and numbers as structural relationship of parts and whole versus counting objects.

Qualitative differences in learning as a function of qualitative differences in teaching

Keywords: Phenomenography, Secondary education, Student learning, Teaching / instruction

Presenting Author:Ming Fai Pang, The University of Hong Kong, Hong Kong; **Co-Author:**Ference Marton, Göteborg University, Sweden

This presentation reports a study which aims to identify pedagogical principles that are critical to the development of financial literacy. An in-depth secondary analysis of the data collected in our earlier project was conducted. Two classes were chosen to be the object of study, on the ground that students who belonged to one class performed best in all the three post-tests, whereas those who belonged to another achieved the lowest scores throughout. The focus of the data

analysis was on the relationship between how the object of learning was enacted in the classroom and how the students experienced the object of learning (i.e. how the outcomes of their learning varied). We found that focusing on the powerful conceptual tools of economics built on the core financial concepts, and embedded in theory-based patterns of variation and invariance between tasks, illustrations, and so forth can help students develop a good grasp of those core financial concepts related to critical aspects that they need to consider when handling financial matters. Furthermore, the provision of relevant financial scenarios helps students learn from future situations that call for the exercise of financial literacy, and thus continue improving their financial literacy in the long term.

Light and Shadow in primary school - Towards elementary optics and understanding radiation

Keywords: Design based research, Mixed-method research, Phenomenography, Primary education

Presenting Author: Mona Holmqvist, Malmö University, Sweden; **Presenting Author:** Lydia Murmann, University of Bremen, Germany

The scientific explanation for shadows is counterintuitive. It focuses on the local absence of light. Perception of a figural shadow on the other hand, usually is a figure-ground experience, with the shadow representing the 'positive' image in the foreground and the illuminated environment the ground. Learning to explain shadows is a content of elementary and middle school curricula and a considerable number of studies that deal with children's conceptions of light and shadow are available. The first section of the poster shows that these findings can be structured by very few critical aspects of learning that belong to a set of phenomenographic categories (study 1). The second section of the poster shows how these findings are taken up for a current learning study in which the introduction of a model of light in primary school is focused (study 2). This is due to the insight, that exploring shadows does not provide a suitable basis for developing the knowledge needed for their explanation. Shadows rather distract attention from light. Therefore, teaching intends to provide exploration, insights and knowledge in contexts different from the ones they are later applied to. Methodologically the current study is based on a design-based research approach, more specifically a learning study. The methodology of learning studies was developed in Sweden and Hong Kong and combines the idea of lesson studies with variation theory. The model of light can also be viewed as the basis for cumulative learning towards understanding radiation in general.

Classroom interaction in student presentations and follow-up discussions in a university EFL course

Keywords: Conversation / Discourse analysis, Higher education, Language (Foreign and second), Social interaction

Presenting Author: Frantisek Tuma, Masaryk University, Czech Republic

This paper presents selected outcomes of a qualitative analysis of classroom interaction during student presentations and follow-up discussions in an English as a foreign language (EFL) course conducted in a Bachelor's programme at a Czech university. Student presentations and subsequent discussions appear interesting both interactionally (e.g. collaborative aspects of "improvisation" during the presentation, the shift of control from the presenters towards the teacher after the presentation) and educationally, as these represent a student-centered activity, whose dynamics and organization remain relatively underresearched. The data (video-recordings of 11 90-minute lessons, 987 minutes) were collected as a case study of an intermediate EFL course for future teachers within a research project (GA ČR 15-08857S). To study the interactional dynamics, I used conversation analysis to analyze 12 presentations given by individuals or pairs. In this paper I will present the outcomes in the areas of the organization of repair during the presentations and the organization of turn-taking during the discussions. In presentations given by pairs, the presenters dealt with troubles (typically attempting to pronounce unknown words, problems with transitions) interactively using self-initiated peer-repair sequences, while individual students generally had to rely on self-repair. During the discussion phase, the participants always transitioned from turn-type pre-allocation (the students finished their presentation and typically asked for questions) to mediated turn-allocation (the teacher became a moderator and, finally, self-selected to ask several questions). At the end, I will compare the findings with relevant literature and evaluate the organization of presentations and discussions pedagogically.

Learning about religion in the formal education of a Finnish Reception Centre for asylum seekers

Keywords: Content analysis, Culture, Religious studies, Multicultural education

Presenting Author: Tapani Innanen, University of Helsinki, Finland

In 2015, Finland experienced the largest amount of refugees seeking asylum since the World War II. The Finnish authorities rapidly organised a network of Reception Centres where services including accommodation, the required financial aid, and some formal education are provided for asylum seekers. Most of these refugees come from Muslim majority countries, and they were facing the Finnish culture characterised by Lutheran Christianity. A larger academic research will in 2016–2017 be implemented in a Reception Centre situated in the Middle of Finland. The overall aim of the project is to investigate discourses and practices concerning religions, world views, and cultural traditions in the Reception Centre. The study, presented in this poster, is focused on the question how religion and religion related discourses are present in the situations of formal education available for the asylum seekers. There are three stages of formal education available for the asylum seekers: Early childhood education (under school aged children); Basic education (children in age of 6–16); Adult education. The theoretical framework of the study is threefold: Religion is understood in the way of lived religion. Educational instructions are situated in the Finnish legislation about Religious Education in the established school system. The acculturative importance of the pre-integrative formal education is seen in the frame of temporary and unsure living situation of the asylum seekers. The research material is gathered by an ethnographic approach, i.e. mainly in the ways of participant observations, discussions, and interviews. Some preliminary results are presented in the poster.

Promoting Students' STEM Literacy Skills Through a PBL Online Simulation

Keywords: Argumentation, Educational Psychology, Writing / Literacy, Problem-based learning

Presenting Author: Scott W Brown, University of Connecticut, United States; **Co-Author:** Kimberly Lawless, University of Illinois at Chicago, United States; **Co-Author:** Christopher Rhoads, UConn, United States

Problem-based learning (PBL) is an instructional design approach for promoting student learning, in context-rich settings. GlobalEd 2 (GE2) is PBL intervention that combines face-to-face and online environments during a 12-week simulation of international negotiations of science advisors on global water resource issues. The GE2 environment is described examining the impact it has had on middle school students' written scientific argumentation and the development of STEM literacy during the intervention. The data reported here are from three parallel simulations that include both GE2 intervention students and a comparison group of Normal Educational Practice (NEP) students who were administered pre- and post- assessments. Analyses employed HLM techniques on treatment and NEP groups revealing a significant positive impact on the written scientific argumentation scores of 1818 middle-grade students from two states and school environments (urban and suburban) with an effect size of 0.257 (p

Education into dialogue: Blogging across cultural and religious difference

Keywords: Conversation / Discourse analysis, E-learning / Online learning, Reflection, Multicultural education

Presenting Author: Rupert Wegerif, University of Exeter, United Kingdom

This paper combines theory development with an empirical study in order to explore and unpack the claim that dialogic education involves a direction of change upon an ontological dimension from monological bounded identity formations in the direction of more dialogic identity formations characterised by openness to the other and identification with the process of dialogue. Data is drawn from an evaluation of the Tony Blair Faith Foundation's Face to Faith programme which supports schools in over thirty different countries to engage in dialogue with each other through videos and blogs about issues of culture and religion with the specific aim of increasing dialogic open-mindedness. A corpus linguistics approach to analysing some of the blogging data, specifically reflection activities given to students before and after engaging in blogging with other schools, reveals shifts in identity and in level of complexity. This data analysis is supported by interviews with students and staff from 6 schools in three countries. The findings illustrate movement in the direction of becoming more dialogic in the context of internet mediated dialogue and so show the value of positing an ontological dimension from a more monologic identity to a more dialogic identity.

Paving the road to sustainable educational change

Keywords: Learning approaches, School effectiveness, Secondary education, Teacher Professional Development

Presenting Author: Mireille Hubers, University of Twente, Netherlands

An important challenge in education is to ensure sustainable changes in teachers' behaviour after they have participated in professional development programs. Research on sustainability is scarce, yet crucial for coming to a deeper understanding of the dynamic between professional development programs and the resulting on-the-ground responses and actions. As a result, there is an increasing demand for more knowledge about sustainability. Therefore, this theoretical paper will provide a framework for thinking about sustainability. Amongst other things, it covers the conceptualisation, the methodology, implications for the way in which professional development programs should focus on (teacher) learning, and lessons that can be learned from other disciplines. In this paper I argue that sustainability is composed of four essential characteristics: 1) long-term and school-wide change, 2) this change has a positive effect on students, 3) this effect is attributable to the professional development program, and 4) educators are able to act as knowledgeable agents. This definition has several implications for research designs. Amongst those is the requirement for using longitudinal designs, and determining the development of schools' organisational routines. The definition of sustainability also has implications for the way in which researchers think about their professional development program. The most important one is that a sole focus on individual

learning will not suffice to obtain sustainable changes. Rather, it should be combined with a focus on organisational learning. Implications for future research and the educational practice of the issues covered in this paper will be discussed as well.

Making scientific modeling tangible for problem solving – Assessment of the procedural dimension

Keywords: Assessment methods and tools, Competencies, Problem solving, Science education

Presenting Author: Susanne Digel, University of Koblenz-Landau, Germany; **Co-Author:** Alexander Kauertz, University of Koblenz-Landau, Germany; **Co-Author:** Patrick Löffler, University of Koblenz-Landau, Germany; **Co-Author:** Jochen Scheid, University of Koblenz-Landau, Germany

Large scale assessments of scientific literacy (as in PISA and TIMSS) shifted the focus of science education from a mere understanding of scientific concepts to their application in real-life contexts. PISA results suggest that there is a gap between availability and usability of content knowledge and strategies in problem solving. Students with appropriate problem solving skills seemed to fail to make use of it in context (production deficiency) and in physics context-based tasks the influence of content knowledge on problem solving performance is limited. Although considerable amount of research has been dedicated to the moderating variables of this discrepancy (e.g. motivation and metacognition), the competences needed to clear that hurdle remain unidentified. A promising basis for the application of problem-solving strategies and physics content knowledge is scientific modeling, since models “embody a form of flexible knowledge that can be applied to transfer problems” (Clement, 2000, p. 1042). Hence this project aims at answering the question how skills in scientific modeling foster the problem solving performance in context-based tasks. First scope of the study is to make scientific modeling tangible for problem solving. The deliverables are a normative competence model and the appendant assessment tool for scientific modeling that are empirically proven and can give indication how to foster these skills.

Poster Presentation

Cognitive Science, Learning and Instructional Technology, Teaching and Teacher Education

PO: Comprehension of Text and Graphics

Keywords: Cognitive development, Cognitive skills, Competencies, Comprehension of text and graphics, Computer-assisted learning, Cooperative / collaborative learning, Early childhood education, Educational Psychology, Engineering, Experimental studies, Informal learning, Instructional design, Mathematics, Multimedia learning, Numeracy, Pre-service teacher education, Professions and applied sciences, Quantitative methods, Reading comprehension

Interest group: SIG 02 - Comprehension of Text and Graphics

Chairperson: Man Ching Esther Chan, The University of Melbourne, Australia

Investigating the integration of multimedia information by means of eye tracking

Keywords: Comprehension of text and graphics, Educational Psychology, Experimental studies, Multimedia learning

Presenting Author: Anne Schueler, Leibniz-Institut für Wissensmedien, Germany

The aim of the reported study was to investigate whether learners integrate information conveyed across different slides of a multimedia presentation with each other. In the learning phase, subjects ($N = 60$) were presented with information about the development of a tornado. In the control group, all information conveyed through the eight pages of the learning environment was consistent. In the experimental group, the third slide of the presentation contained information that was inconsistent to the information presented on the second slide. During learning, eye-movement behavior of learners was measured. Analyses revealed that the eye-movement behavior of the control and experimental group did not differ regarding slides containing consistent information in both conditions. However, groups differed regarding the third slide containing consistent information in the control, but inconsistent information in the experimental group: Here, learners of the experimental group had longer fixation times on text and picture, and more transitions between text and picture. These data show that learners of the experimental group detected the conflict, indicating that they tried to integrate the information of consecutive slides with each other.

Efficiency to process finger configurations predicts initial math performance

Keywords: Cognitive development, Early childhood education, Mathematics, Numeracy

Presenting Author: Josetxu Orrantia, University of Salamanca, Spain; **Co-Author:** Rosario Sánchez, University of Salamanca, Spain; **Co-Author:** Laura Matilla, University of Salamanca, Spain; **Co-Author:** Javier Rosales, University of Salamanca, Spain; **Co-Author:** David Munez, National Institute of Education / Nanyang Technological University, Singapore; **Co-Author:** Lieven Verschaffel, KU Leuven, Belgium

Previous research has shown that finger-based strategies play an important role in learning and understanding arithmetic. However, little research has examined young children's ability to process finger configurations, and its significance for emerging math abilities. In this study, we aimed at examining whether efficiency to process finger configurations is a unique

predictor for initial math competences before formal math instruction starts. We controlled for influence of domain-specific numerical precursor competencies and domain-general cognitive ability. Results from 102 Spanish kindergarteners showed that efficiency to process finger configurations predicted a unique and relevant part of the math performance. These results suggest that educational practices encouraging the use of finger configurations could be a bridge between numerical quantities and their symbolic representation, which would support the development of number and arithmetic.

Detecting errors in program flow diagrams: Comparing novices and advanced programmers

Keywords: Competencies, Comprehension of text and graphics, Engineering, Professions and applied sciences

Presenting Author:Markus Nivala, University of Gothenburg, Sweden; **Co-Author:**Florian Hauser, Ostbayerische Technische Hochschule (OTH) Regensburg, Germany; **Co-Author:**Helen Jossberger, University of Regensburg, Germany; **Co-Author:**Markus Reiss, Ostbayerische Technische Hochschule (OTH) Regensburg, Germany; **Co-Author:**Juergen Mottok, Ostbayerische Technische Hochschule (OTH) Regensburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany

One of the key competences for a software engineer is the ability to understand visual representations of software, and to understand their correspondence to source code. Our aim is to study how programmers read and understand program diagrams and source code. The participants ($N = 33$) were novice ($n = 23$) and intermediate ($n = 10$) programmers. The experiment consisted of 12 stimuli, which included visual software diagrams and corresponding source codes. Half of the stimuli had an error in the code that caused a discrepancy between the code and the diagram. The participants were asked indicate whether code and diagram were identical in functionality. If not, they had to identify the error. Eye movements and performance were recorded. The preliminary analysis of the data focuses on performance, strategies and distribution of fixations. On average, the novices answered 82 per cent of the multiple choice questions correctly. The eye movements revealed three different reading strategies. The most common strategy was to start immediately comparing the diagram with the code. However, there were five novices who read either the code or the diagram first in its entirety. Furthermore, the novices spent slightly more time fixating on the source code than on the diagrams, which may indicate that they find it more difficult to understand. Unveiling the developing strategies and their expert counterparts helps us to understand what are the areas in which novices need the most support.

The Effects of Reading Goals on the Comprehension of Argumentative Text and Belief Change

Keywords: Cognitive skills, Comprehension of text and graphics, Informal learning, Reading comprehension

Presenting Author:Irene-Anna Diakidoy, University of Cyprus, Cyprus; **Co-Author:**Melina Ioannou, University of Cyprus, Cyprus; **Co-Author:**Stelios Christodoulou, University of Cyprus, Cyprus

Abstract Argumentative text is a primary medium of learning and belief formation, often providing the basis for decisions that range from trivial to critical. Past research has documented the high persuasive impact of argumentative text in the absence of a critical evaluation of its arguments and regardless of comprehension. The present study examined the extent to which readers will focus more on the argument line and apply critical evaluation processes when their goal is to evaluate the text as opposed to comprehend. Students were pretested on their initial beliefs and prior topic knowledge before reading one of two versions of two argumentative texts promoting claims on the basis of arguments varying in terms of a specific fallacy inclusion. Half of the students were instructed to read the texts for comprehension while the rest were instructed to read with the goal of evaluating their argument lines. After reading, all students evaluated the text and indicated the degree to which they agreed with the main claim they promoted. Comprehension measures included text recall and number of valid inferences generated in recall. The results indicated that students who read to evaluate recalled more text information and were less likely to change their initial beliefs as a result of reading than students who read for comprehension. However, the absence of any effects of argument quality on evaluation and belief change indicated a lack of critical evaluation. Findings are discussed in relation to their theoretical and educational implications.

Learning by teaching. Improving teacher students' reading strategy skills

Keywords: Cooperative / collaborative learning, Pre-service teacher education, Quantitative methods, Reading comprehension

Presenting Author:Nadine Spörer, University of Potsdam, Germany; **Co-Author:**Helvi Koch, Universität Potsdam, Germany; **Co-Author:**Jennifer Lambrecht, University of Potsdam, Germany; **Co-Author:**Thorsten Henke, University of Potsdam, Germany

Educational studies about reading instruction in regular classrooms indicated that teachers spend too little time instructing reading strategies. Moreover, teachers often have only limited knowledge about reading strategies and they do not know exactly how to implement reading strategy programs. Therefore, there is a need to provide future teachers with knowledge about the effective application of reading strategies and about methods how to teach these effectively. In this intervention study, we taught first semester students of teacher training how to instruct primary school students in using reading strategies. The aim of the study was to analyze whether and to what extent students benefited from the intervention within their own reading strategy skills. The sample consisted of $N = 74$ students who took part in one of two conditions: (a) a reciprocal teaching intervention and (b) a control group with an alternative training. Both conditions were designed as an introduction to scientific working techniques and one of the seminar's topics dealt with effective reading strategies. In the

intervention condition teacher students additionally learned how to implement reciprocal teaching in the classroom. Training success was assessed in a pre-posttest design with a standardized reading comprehension test and two self-constructed reading strategy tasks measuring students' declarative and procedural knowledge about strategy use. To compare the development of the students in the two conditions, repeated measures ANOVAs were estimated. At posttest, intervention students outperformed control students in reading strategy knowledge but not in reading comprehension.

Prerequisite Knowledge and Time of Testing in Learning with Animations and Static Pictures

Keywords: Comprehension of text and graphics, Computer-assisted learning, Instructional design, Multimedia learning

Presenting Author:Tim Kühn, University of Mannheim, Germany; **Co-Author:**Sabrina Navratil, University of Mannheim, Germany; **Co-Author:**Stefan Münzer, Universität Mannheim, Germany

Animations can possess an informational advantage compared to static pictures. This informational advantage is assured for the used animations of the current study. Thereby, it will be investigated whether the corresponding informational disadvantage of static pictures can be compensated when learners possess adequate prerequisite knowledge to be able to correctly infer this missing information. When correctly inferring the information with static pictures, learners are supposed to be more actively engaged. This higher engagement might especially pay-off in the long run. Hence, it will moreover be examined whether this supposed higher engagement will lead to a better lasting knowledge representation for learners with static pictures, meaning that learners with adequate prerequisite knowledge receiving static pictures might even outperform their counterparts receiving animations in a delayed test. To examine these assumptions, a 2x2x2-Between-Subject-Design with visualization format (static picture vs. animation), prerequisite knowledge (conveyed vs. not conveyed) and time of testing (immediate vs. after one week) as independent variables will be used. It is planned that 32 participants will serve in each condition, making in total 256 participants. Data collection is still in progress and the results will be presented and discussed at the conference.

Session E 4

Teacher-child interactions with monolingual and multilingual kindergarteners

Keywords: Bilingual education, Conversation / Discourse analysis, Early childhood education, Social interaction

Presenting Author:Annegien Langeloo, University of Groningen, Netherlands; **Co-Author:**Mayra Mascareño, University of Groningen, Netherlands; **Co-Author:**Marjolein Deunk, University of Groningen, Netherlands; **Co-Author:**Maaïke van Rooijen, University of Groningen / GION, Netherlands; **Co-Author:**Jan-Willem Strijbos, University of Groningen, Netherlands

The interaction between teacher and child is the main proximal process for delivering learning opportunities to a child in educational settings, and therefore the main determinant of classroom quality. However, the same teacher input might represent different learning opportunities to children with diverse backgrounds. The current study will investigate the learning opportunities that monolingual and multilingual children experience through teacher-child interactions in early childhood education classrooms. Previous research shows that multilingual children have more managerial interactions, get briefer responses of the teacher in educative situations and receive less affirmations on correct responses than their monolingual peers. Therefore, we expect interactions to differ for children with diverse language backgrounds on, amongst others, the content of interaction, its level of complexity, and in types of conversational turns such as feedback types. Data will be collected in 20 Dutch kindergarten classrooms at three time points, all roughly three months apart. In each classroom, four children (aged 5-6 years) are selected of which two are multilingual. At each time point, video recordings are made to measure general classroom quality and to assess the individual teacher-child interactions. Data for time point 1 is currently being collected (October 2016). During the round table at EARLI, fragments from teacher-child interactions with monolingual and multilingual kindergartners will be discussed, aiming to refine a coding scheme for analyzing the data.

Agreement Between Students' and Principals' Ratings of Teacher's Use of Motivational Strategies

Keywords: Assessment methods and tools, Motivation, Teacher Effectiveness, Teaching approaches

Presenting Author:Christi Bergin, University of Missouri/Columbia, United States; **Co-Author:**David Bergin, University of Missouri/Columbia, United States; **Co-Author:**Eli Jones, University of Missouri/Columbia, United States

This paper addresses whether students and principals perceive teachers similarly regarding their use of motivational

strategies. Classroom observations and student surveys of teacher's effectiveness are widely used, but hotly debated, as U.S. policies push schools toward rigorous teacher evaluation. Little is known about the agreement between these two important sources of data. In the present study, data are from surveys of secondary students of 485 teachers who also experienced 3-5 classroom observations conducted by their principals throughout the school year in Missouri (USA). Principals completed annual training on how to do classroom observations using a standardized rubric. Student surveys were delivered online at school. Results suggest there is only modest overlap between students' and principals' perceptions when they are asked about a teacher's use of the same strategies. The mean of student survey items and the mean classroom observation ratings correlated $r = .236$ ($p = .000$). Our results are in accord with one other study that addressed this same research question conducted in Pittsburgh schools. Both the present study and the Pittsburgh study raise issues about leniency in principals' ratings of classroom observations.

The Principal Effect: Detecting Principal Error in Classroom Observations

Keywords: Assessment methods and tools, Educational policy, School effectiveness, Teacher Effectiveness

Presenting Author:Christi Bergin, University of Missouri/Columbia, United States; **Co-Author:**Eli Jones, University of Missouri/Columbia, United States

This study investigates the quality of principals' observations of teaching practices (OTP) in an authentic teacher evaluation system in the U.S. Data are from 250 school districts (421 principals, 4,640 teachers). Principals are trained annually to use a standardized rubric to score teaching effectiveness. Principals rated a standard set of classroom videos at Time 1, and a different set again a year later at Time 2; between these time periods principals rated four teaching episodes of teachers in their own buildings. Many-facets Rasch measurement (MFRM) was used to investigate the functioning of OTP ratings in teacher evaluation. Results suggest that all principals tended to be lenient with their own teachers, with substantial individual differences in leniency. Generally, principals used the scale consistently and differentiated between specific teaching practices within a single OTP. Results were similar for elementary and secondary schools. Thus, overall OTP ratings are meaningful and useful; OTP can distinguish between teachers of varying effectiveness. However, caution is warranted when comparing ratings across schools and ratings should generally be interpreted as inflated. MFRM techniques proved useful in identifying specific teaching practices that need improvement as well as principals (12%) who may need remediation in conducting OTP.

Exploring Engagement Growth in Japanese Elementary Schools

Keywords: Game-based learning, Language (Foreign and second), Motivation, Primary education

Presenting Author:Quint Oga-Baldwin, Waseda University, Japan; **Co-Author:**Luke Fryer, University of Hong Kong, Hong Kong

@font-face { font-family: "Times"; }@font-face { font-family: " "; }@font-face { font-family: "@ "; }@font-face { font-family: "Cambria"; }p.MsoNormal, li.MsoNormal, div.MsoNormal { margin: 0cm 0cm 0.0001pt; font-size: 12pt; font-family: "Times New Roman"; }div.Section1 { } BackgroundEngagement and motivation have an interrelated, dynamic relationship. Theoretically, motivation may be used to predict how students will engage with their studies over time. This may further help to define how students develop within a specific course of study in relation to their classroom experiences. AimsUsing self-determination and engagement theories, we investigated how students' engagement grows over the course of two years in game-based foreign language classes. MethodsElementary school students from a suburban school district in Japan ($n = 478$) completed surveys during the 2013 and 2014 school years. Students' engagement was measured at five time points during their two years of English instruction. Latent Growth Curve (LGC) analysis was used to measure changes in their engagement. ResultsResults showed a clear positive trend for cognitive engagement over the course of two years. Behavioral engagement showed weak growth, while emotional engagement did not change. These findings indicate that students' behavior and enjoyment of their classroom activities may not change over time, reaching a stable point, while they may begin to engage in cognitive aspects of communication over the course of their studies.

Teachers' self-efficacy, goal orientations, and classroom behaviours – An interaction analysis

Keywords: Goal orientation, Motivation, Self-efficacy, Teaching / instruction

Presenting Author:Sindu George, Monash University, Australia

Teacher motivation was an underemphasized area of research until recently. The absence of a sound theoretical framework has been highlighted as the main reason for the lack of research in this area (Butler, 2007; Richardson & Watt, 2006). Since the 2000s, researchers have focused on systematic and theory-driven research on teacher motivation. For example, Watt and Richardson (2007) adopted expectancy-value theory for studying student teachers' motivation for entering teaching profession; Roth, Assor, Kanat-Maymon, and Kaplan (2007) employed self-determination theory to study autonomous motivation for teaching; and Butler (2007) adapted achievement goal theory to study teacher motivation in terms of their goal orientations. The current study presents an integrated perspective on teacher motivation incorporating two different constructs: teachers' self-efficacy from Bandura's social cognitive theory, and teachers' goal orientations from achievement goal theory under the overarching framework of 'expectancy X value' theory.

Academic optimism as a lived experience.

Keywords: Educational Psychology, Secondary education, Self-efficacy, Teacher Effectiveness

Presenting Author: Claire Lloyd, Liverpool Hope University, United Kingdom; **Co-Author:** Sue Cronin, Liverpool Hope University, United Kingdom

Over the past four decades, three organizational properties of schools have emerged that have consistently been found to exert a powerful influence on student achievement, even when controlling for SES. Properties include academic emphasis of the school, collective efficacy of the faculty, and the faculty's trust in parents and students – all of which are linked together as a single powerful latent construct called academic optimism (Hoy, Tarter, & Woolfolk-Hoy, 2006).

While instruments have been developed to provide robust quantitative measures of academic optimism (Hoy et al., 2006), there is less understanding of how this complex phenomenon operates within schools. The current study addresses this gap by seeking an understanding of the organisational properties of two urban United Kingdom secondary schools – one displaying the characteristics of high academic optimism and the other showing low optimism. A Case Study approach was adopted because of its focus on exploring phenomenon in real-life contexts to develop rich, contextualised understandings of everyday routines, roles and relations (Yin, 1981). Drawing on the phenomenological method, repeated interviews were conducted with school leaders and teachers to allow for multiple dimensions of academic optimism in schools to be revealed and understood (Stake, 2006). Preliminary results suggest that the everyday dynamics of the case school with high measures of optimism are qualitatively different from those in the school with low optimism. Further research will be undertaken to provide rich descriptions of life in these schools. This work will contribute to an understanding of academic optimism as a lived experience.

Self-Concept Mediates the Relation between Achievement and Emotions in Mathematics

Keywords: Achievement, Attitudes and beliefs, Emotion and affect, Mathematics

Presenting Author: Jojanneke van der Beek, Utrecht University, Netherlands; **Co-Author:** Sanne van der Ven, Utrecht University, Netherlands; **Co-Author:** Paul Leseman, Utrecht University, Netherlands; **Co-Author:** Evelyn Kroesbergen, Utrecht University, Netherlands

Mathematics achievement is related to positive and negative emotions such as enjoyment and anxiety. Based on Pekrun's control-value theory of achievement emotions, students' academic self-concept may be an important mediator of the relation between mathematics achievement and emotions. As emotions predict the likelihood of career aspirations in science or math, high achieving students are of special interest. The study aimed to investigate the mediating role of self-concept in the relation between mathematics achievement and emotions (i.e. enjoyment and anxiety), and to test possible differences in this mediating role between low, average, and high achieving students. Participants were 1014 ninth-grade students from eight urban secondary schools in the Netherlands. Through an online survey, including mathematical problems, students were asked to indicate their levels of mathematics enjoyment, anxiety and self-concept. Structural equation modeling was used to test the mediating role of self-concept in the relation between mathematics achievement and emotions. Multigroup analyses were performed to compare these relations across the three achievement groups. Results confirmed full mediation of the relation between achievement and emotions in mathematics by self-concept. Furthermore, we found higher self-concepts, a higher level of enjoyment in mathematics and a lower level of math anxiety in high achieving students compared to average and low achievers. No differences across these achievement groups were found in the relations of the mediational model. The pivotal role of self-concept in relation to emotions and achievement in mathematics should encourage educators to be aware of the ways in which they shape their students' self-concept.

Arabic Language Learners' Self-Efficacy and its Sources

Keywords: Language (Foreign and second), Motivation, Self-efficacy, Social aspects of learning and teaching

Presenting Author: Laura Page, University of Kentucky, United States; **Presenting Author:** John Eric Lingat, University of Kentucky, United States; **Co-Author:** Hadeel Ali, University of Denver, United States; **Co-Author:** Ellen Usher, University of Kentucky, United States; **Co-Author:** Parth Patel, University of Kentucky, United States; **Co-Author:** Tiffany Thomas, University of Kentucky, United States

This study examined beliefs of emerging Arabic speakers and their sources of self-efficacy. While the enrollment of students in Arabic as a foreign language course continues to increase (MLA, 2016), minimal research has been conducted to understand the beliefs of students learning how to speak Arabic since it is one of the least commonly studied foreign languages in the United States (Alkhateeb, 2014). Ninety-two Arabic language students were surveyed in a large, public university in the Southeastern United States regarding their speaking self-efficacy beliefs and the sources of their self-

efficacy. Oral language proficiency scores were provided through teacher ratings. In addition, this study examined the differences between male and female students.

Socio-demographic and academic predictors of educational aspirations of elementary school students

Keywords: Educational attainment, Educational Psychology, Motivation, Primary education

Presenting Author: Iris Marušić, Institute for Social Research, Croatia; **Co-Author:** Josip Šabić, Institute for Social Research, Croatia

Research efforts in various contexts have indicated that young persons' educational aspirations are strong determinants of their educational and more general life choices and outcomes. Students with higher educational aspirations have greater motivation and higher educational attainment, as do those for whom parents and teachers hold higher educational expectations and aspirations. The proposed research aims to examine some determinants of pupils' educational aspirations at the transitional period of Croatian elementary education, when pupils decide about their future educational trajectory into secondary education. The first set of variables examined are gender and parental education followed by a set of relevant academic variables such as achievement, self-concept and learning strategies. This research was carried out on a sample of 231 eight-graders from 36 schools. Participants completed a questionnaire assessing educational level of their parents, school achievement, academic self-concept, learning strategies and their aspirations for secondary school. Two-step binomial logistic regression was performed to determine the effects of the selected variables on the likelihood of students' aim to enrol in a grammar or vocational school. The model with both sets of predictors correctly classified 84.8% of students according to their aim to enrol in a grammar school. The only significant predictors were school achievement and academic self-concept, indicating that students with better school grades who consider themselves as more academically able aim to enrol grammar school.

Engaging in Lesson Study: How it Impacts Teachers' Learning and Professional Agency?

Keywords: Collaborative Learning, Cooperative / collaborative learning, In-service teacher education, Teacher Professional Development

Presenting Author: Mihaela Miteşcu Manea, The National University of Arts "George Enescu" Iasi, Romania

The initial phase of an exploratory study focusing on understanding how Romanian teachers learn to teach for diversity and inclusion allowed for an insight into what matters most to the teachers and to their schools in the course of learning. The findings in this early stage of our research had become indicative of teachers' preferred strategies of finding and affirming, in the space of the schools' common practices, specific positions regarding the challenges of teaching and learning for diversity and inclusion. Emphasis on confinement to the traditional boundaries of discipline specialization and the habitual approach to educational change by deploying ready-made meanings and procedural prescriptions for action in a top-down dynamic of delegating responsibility for efficient action in the classroom, have restricted practitioners from developing contextualized, collaborative practices of professional learning by inquiring and experimenting with the various tools of the profession available in their schools. Drawing on cultural historical activity theory framework, the proposed study aims at an exploration of the effects on Romanian teachers' language and understanding of professional agency, whilst for the first time engaging in Lesson Study (Dudley, 2013) approaches to planning and learning to teach for diversity and inclusion. The implications for research and for educational practice of first findings in this exploratory study are proposed for discussion.

Exploring configurations of personal and situational factors in teachers' identity development

Keywords: Communities of learners, Qualitative methods, Reflection, Teacher Professional Development

Presenting Author: Gonny Schellings, Eindhoven University of Technology, Netherlands; **Co-Author:** Janine Mommers, Eindhoven University of Technology, Netherlands; **Co-Author:** Maaike Koopman, Eindhoven University of Technology, Netherlands; **Co-Author:** Douwe Beijaard, Eindhoven University of Technology, Netherlands

Learning to teach is a process strongly influenced by configurations of personal and situational factors. Beginning teachers should find a satisfying balance between what they personally find important for learning to teach and the professional demands or expectations expressed in standards and set by their schools. During four professional development meetings, 40 beginning teachers from 13 secondary schools were supported to become aware of these personal and situational factors that shape their professional identity development. The teachers wrote short reflection reports and answered

reflective questions. These data were transformed into portraits of each teacher; subsequently these portraits were analysed for configurations of personal and situational factors. Some portraits included similar personal factors, such as being perfectionistic, other portraits included similar situational factors, such as getting support from colleagues. A broad concern such as experiencing work load consisted of different configurations, namely, being perfectionistic and feeling no support, or being perfectionistic and experiencing high demands. Different configurations led to different kinds of behaviour (e.g., taking own responsibility) or feelings (e.g., feeling insecure) of beginning teachers. In all, beginning teachers should become aware of their configurations of personal and situational factors to give direction to their construction of a professional identity.

Shifting positions when engaging in practice through Design-Based Research

Keywords: Design based research, Mixed-method research, Qualitative methods, Researcher education

Presenting Author: Roland Hachmann, University of Southern Denmark, Denmark; **Co-Author:** Lea Tilde Rosenlund, University of Southern Denmark, Denmark; **Co-Author:** Jens Jørgen Hansen, University of Southern Denmark, Denmark

In this round table discussion, we wish to portray and negotiate different perspectives of participation as a basic condition when conducting Design-Based Research. The position of the researcher is not fixed and must adjust and adapt in-process, and in collaboration with practitioners.. Although the literature on Design-Based Research addresses perspectives on roles of the researcher, and the co-designers or practitioners, we find that focus is often on skills needed, e.g. being an expert in the field, rather than on the phenomena of shifting positions in the phases and contexts of research. We propose the phenomenon of shifting positions as consequential to the scope and outcomes of a project. Discussing these shifts in relation to benefits and challenges particular to the Design-based Research approach is necessary to stimulate awareness of these issues. As these issues are valuable to both researchers and practitioners, considering them may generate recommendations on how to prepare for these shifts when conducting Design-Based Research. To illustrate how positions shift in actual practice, we draw upon two empirical studies conducted in the context of Teacher Education Programme. We present one case where the researcher is positioned as a second teacher within the classroom, and another case where the researcher needs to renegotiate his position as co-designer and researcher after an intervention in the design experiment. Our goal is to gather ideas and contributions through discussion of the concept and characterisation of shifting positions, collectively considering how this concept may advance Design-based research.

First-year students approach interdisciplinarity in Nanoscience course

Keywords: Conversation / Discourse analysis, Higher education, Science education, Social interaction

Presenting Author: Anna-Leena Kähkönen, University of Jyväskylä, Finland

Interdisciplinary studies, as well as interdisciplinary work, is on the rise in the society. This study looks at understanding interdisciplinarity from point of view of Nanoscience students. How do they recognize and use disciplines in group work, during their first interdisciplinary course in a Nanoscience program? The discipline-related social interaction is studied with conversation analysis of group discussions. For improving the course, desired outcomes, such as learning to appreciate and rely on disciplinary knowledge of others, are mapped. The studied interactions and tasks they occur in tell us which types of tasks can help students understand disciplines and interdisciplinarity and how they approach these themes as parts of their identities.

Empirical Investigation of Challenges for PBL Stakeholders in Engineering Education

Keywords: Engineering, Higher education, Qualitative methods, Problem-based learning

Presenting Author: Daniel Rees Lewis, Northwestern University, United States; **Presenting Author:** Spencer Carlson, Northwestern University, United States; **Co-Author:** Matthew Easterday, Northwestern University, United States; **Co-Author:** Elizabeth Gerber, Northwestern University, United States

Project-Driven Learning (PDL), including project- and problem-based learning, can effectively teach authentic practices and knowledge. PDL involves many interrelated practices and technologies that researchers and practitioners continually improve. To design practices and technologies that PDL stakeholder willing adopt and thus scale widely, we must design understand the perceived challenges of PDL stakeholders. In this work, we study university students and instructors

involved with Engineering PDL. We ask, what do students and instructors in Engineering PDL perceive as their greatest challenges? We interviewed 99 Engineering Education PDL stakeholders; including 53 undergraduate and graduate students and 46 university instructors, from 27 different universities. We analyzed interview data using grounded theory to identify PDL challenges for a variety of stakeholder. We found that students perceived their greatest challenges to be managing a complex process and peers collaboration. Specifically, they face challenges related to interpreting varied instruction, team planning, accountability, and getting regular feedback and validation on project plans and direction. Instructors' perceive their greatest challenge as managing multiple semi-independent teams. Specifically, they face challenges tracking teams, providing enough feedback to students, setting up projects before the class starts, and untangling team performance to give individuals formative and summative assessments. To design pedagogical practices and technologies that will be widely adopted within Engineering PDL, engineering education must address these student and instructor challenges.

Disciplinary Practices and Multiple Literacies: How Can they Meet in the Middle?

Keywords: Inquiry learning, Instructional design, Literacy, Teaching / instruction

Higher education faces a number of challenges, including the need to socialize learners into the practices of particular disciplines, as well as provide an essential education to prepare learners for citizenship. Specifically, individuals require the capacity to critically evaluate information sources, which increasingly include sophisticated data representations and visualizations. Such representations are not necessarily intuitive, and often require specialized knowledge to recognize their qualities, and their signification in different domains. We propose an approach to the design of instruction in higher education that aims to meet the goal of disciplinary socialization while also cultivating the knowledge and skills needed to engage with the multi-literacy demands of contemporary citizenship. This approach calls for instructors to not only incorporate problem solving in their higher education courses, but to design these problems with an eye toward both disciplinary and everyday skills. In this approach, learners are encouraged to employ sophisticated data-rich visualizations to solve two types of problems: problems that reflect core questions in the domain of study; and problems that reflect the application of domain principles to everyday lives. In this way, learners can develop a grounding in the discipline that goes beyond factual knowledge; consider the relevance of disciplinary learning to their lives—even if they do not pursue a professional career in the discipline; and hone multi-literacy skills enabling them to better use and interpret the sophisticated data-rich representations that are becoming part and parcel of citizenship in the knowledge society.

Which facets of interest do influence the study success at the study entry phase in mathematics?

Keywords: Higher education, Mathematics, Quantitative methods, Motivation and emotion

Presenting Author:Stefanie Rach, University of Paderborn, Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Timo Kosiol, Ludwig-Maximilians-Universität (LMU), Germany

Studies report a high dropout rate in academic mathematical study program. Individual interest is discussed as an important prerequisite for successful mathematical learning processes. For this assumption, empirical studies give however only little evidence. One reason might be that the questionnaires are too imprecise to measure a person-object-relationship. At the transition school-university in particular, the learning object change from an application oriented school subject to a scientific discipline. In this project, we hypothesize that interest in academic mathematics practices influence the study success in the study entry phase, in contrast to interest in school mathematics practices. To investigate this question, we develop a questionnaire (with six to eight items a scale) that differ between the specific interest object (school or academic mathematics practices). 184 bachelor and 140 teacher students deal with the questionnaire at the beginning of the first semester in mathematics. After six weeks, students rated their study satisfaction. At the end of semester, students had to succeed in mathematical tests. In regression analysis, the estimated affective components do not show a significant impact on the achievement of mathematical knowledge, only cognitive related prerequisites explain variance in the tests ($N=76$, $R^2=.46$ resp. $N=55$, $R^2=.28$). In contrast, besides study program ($\beta=.14$, p

Picturing roles: Activation of PhD candidates' role identities as researchers and teachers

Keywords: Doctoral education, Experimental studies, Higher education, Synergies between learning - teaching and research

Presenting Author:Alessa Hillbrink, University of Münster, Germany; **Co-Author:**Regina Jucks, WWU Münster, Germany

In Germany, most PhD candidates in psychology have both research and teaching duties right from the beginning. According to role identity theory (McCall, 2003), individuals hold different identities and roles that influence their motivation and behavior. This becomes evident in the work life at the university: One context, e.g. a seminar, requires a teacher role and according teacher behavior, another context, e.g. a colloquium, requires a researcher role and according researcher behavior. Shifting from one context to another, a shift in the focus of the self-conception from one role to another is necessary. We examine the reactivity of German PhD candidates' role identities to context cues using pictures typical of research or teaching. In a preliminary study, 35 PhD candidates rated whether 30 pictures were representative of research and/or teaching. The most representative pictures of each field are used as stimuli in an experimental between-subjects design, where PhD candidates are involved with either research pictures, teaching pictures or a mixture of both. Subsequently, their current role identity (researcher and/or teacher) is derived from written statements about their work as

PhD candidates. We hypothesize that the role-focus depends on the type of pictures seen before, with research pictures being associated with a higher focus on the researcher role and teaching pictures with a higher focus on the teacher role. In addition, visual material is generated that may be helpful in future research on the two core academic roles, as well as in professional development courses for young academics.

Assessment task using concept map with errors to support accurate feedback for the students

Keywords: Assessment methods and tools, Higher education, Misconceptions, Science education

Presenting Author: Paulo Correia, University of Sao Paulo, Brazil; **Co-Author:** Gisele Cabral, University of Sao Paulo, Brazil

Assessment tasks play a key role to keep students engaged to address conceptual challenges meaningfully. Accurate and frequent feedback is critical to foster pedagogic resonance, *i.e.*, the bridge between teacher knowledge and student learning. Student-generated concept maps (Cmaps) have been the preferred choice to design Cmap-based assessment tasks. The use of Cmap with errors (elaborated by teachers) has been explored to disseminate concept mapping in classroom routine. The aim of this paper was to test an assessment task based on Cmap with errors to help the teacher to give accurate feedback to the students. First-year undergraduate students (n=59) responded to an assessment task about molecular biology. Ten propositions presented misconceptions and the students needed to identify and explain the errors. Hierarchical cluster analysis (HCA) was carried out to verify natural clusters among the propositions with errors and the students' responses. Principal component analysis was executed to confirm the clustering patterns obtained by HCA. The propositions formed 4 clusters (A-D; similarity=79.2%) that revealed different levels of difficulty to identify/explain the errors. Students' responses formed 4 clusters (I-IV; similarity=67.2%) that revealed different levels of performance on task. The Cmap with error assessment task produced valuable information about students' conceptual understanding. Customised feedback was delivered to the students, avoiding the one-size-fits-all approach commonly used in real classrooms. Moreover, the teacher could revise the instructional approach/materials using robust information. At last, Cmaps with errors are also amenable for on-line learning platforms, and the accurate feedback can become automatically delivered.

Participatory roles in small groups working in a virtual collaborative science learning environment

Keywords: Computer-supported collaborative learning, Educational Psychology, Peer interaction, Science education

Presenting Author: Olli-Pekka Heinimäki, University of Turku, Finland; **Co-Author:** Anne-Elina Salo, University of Turku, Finland; **Co-Author:** Marja Vauras, University of Turku, Finland

In this paper, participatory roles in productive small student groups working in a collaborative virtual science learning environment are examined. The study took place in six upper secondary schools in advanced-level biology and chemistry courses. The students worked in 39 small groups of three or two students. Teacher support was provided. In all three 75-95 minutes working sessions, both teachers and peer groups were videotaped and audio recorded, when the students were conducting a scientific experiment in a virtual collaborative science learning environment. Finally, the groups prepared and carried out presentations about their collective outcomes (= group outcome). Outcomes were evaluated on six levels (from 1 = low- to 6 = high+) by independent science experts in regard to the research plan, hypothesis, conclusions and quality of scientific language. Altogether six triads (two low, two averages and two high outcomes groups) were chosen for the role analysis. The identification of participatory roles is based on observable, verbal or non-verbal inputs at the turn level. The video data is analyzed with Noldus Observer XT 12 program. Preliminary outcomes show the same kind of role patterns that were found in the study of Volet et al (2016): High performing groups adopted more content focused roles and showed more flexibility in role taking and role distribution among the group members than lower performing groups. However, also some meaningful differences were identified. In-depth analyses for all six groups will be conducted.

The effect of cooperative learning on group work skills of pupils in Dutch primary education

Keywords: Cooperative / collaborative learning, Peer interaction, Primary education, Quasi-experimental research

Presenting Author: Marij Veldman, University of Groningen, Netherlands; **Co-Author:** Roel J. Bosker, Rijksuniversiteit Groningen, Dept of Education and GION, Netherlands; **Co-Author:** Tom Snijders, University of Groningen, dep. of sociology, Netherlands; **Co-Author:** Simone Doolaard, University of Groningen, Netherlands

Although research on cooperative learning emphasizes the positive effects on student outcomes, there is limited use of cooperative learning in schools. Success for All - The Netherlands (SfA-NL) tries to increase (the quality of) group work in Dutch primary education. The main research question of the study is whether the SfA-NL program leads to improved group work skills of primary school pupils. A quasi-experimental design with a treatment and a control group is used. At the end of school year 2015-2016 grade 1 pupils (6- and 7-year-old children) executed a cooperative learning task in small groups of four pupils (N = 152), which was recorded on video. When the cooperative learning task took place, the pupils of the treatment group had followed SfA lessons for a whole school year. The observation instrument of Blatchford, Baines, Rubie-Davies, Bassett and Chowne (2006) that is used, involves four categories to measure the group work: socioemotional ethos, group participation, discourse topic and type of pupil-pupil dialogue. At this moment, video coding is ongoing. After completing the coding, treatment and control group will be compared by using multilevel analysis. Findings will be presented at the conference. In general terms, it is predicted that changes in behavior as a result of involvement in the SfA-program will lead to more effective group work.

Using Twitter data to understand participation in a science outreach campaign

Keywords: Informal learning, Science education, Social aspects of learning and teaching, Technology

Presenting Author: Adam Maltese, Indiana University, United States

In this poster we will share the results of our research on a recent social media campaign run by Science Friday, a major science-related radio show with > 1M listeners each week in the United States. The campaign was #CephalopodWeek and focused on Twitter. We captured ~13,000 tweets that were part of this campaign. We will discuss the process of collection and share results on who participated and the nature of their participation. Initial results indicate that most of the content was posted by the main participating organizations with most of the activity being retweets of that information. We believe the results of this work can provide organizations with information on how they might expect their social media followers to participate in a campaign.

Indigenous Participation in Arts Education: A framework for increasing learning outcomes

Keywords: Arts, Communities of learners, Culture, Social aspects of learning and teaching

Presenting Author: Robert Barton, Griffith University, Australia

This paper presentation examines current approaches to teaching and learning for Indigenous students globally. It explores how the role of the arts and arts education as a vehicle for realising social justice particularly through storytelling is vital for success for Indigenous students in schools. Results for Indigenous students continue to sit well below that for the non-Indigenous population, demonstrating the need for such an approach. This presentation will therefore suggest that stories and storytelling is a key and more appropriate pedagogical approach for better engaging Indigenous students particularly through the arts and arts education. Stories and storytelling provide important social and cultural functions for Indigenous students. A stronger focus on this approach will ensure that cultural diversity is not a barrier to education participation and performance but rather an enabler. A prospective framework for designing and developing narratives through arts-based practice for Indigenous students is shared. The model is causal in its structure and relationship between each focal point as the story line moves down from 'Why?' and then from left (History?) to right (Where?). The framework is visual in its presentation provides a road map of the journey students will undertake throughout the course of a lesson/topic area. Students can be engaged both in the design and development of content against each element of the model or the teacher can choose to use the framework as a basis for developing their lesson structure and underpinning narrative for its delivery to the class.

School social work in Switzerland. Characteristics and factors of interprofessional collaboration

Keywords: Primary education, Quantitative methods, Social interaction, Social sciences

Presenting Author: Monique Brunner, University of Bern, Switzerland; **Co-Author:** Ueli Hostettler, PHBern – University of Teacher Education, Switzerland; **Co-Author:** Simone Ambord, University of Bern, Switzerland; **Co-Author:** Roger Pfiffner, Bern University of Applied Sciences, Switzerland

Today schools deal with a number of emerging social issues. This places new demands on the division of work and on the collaboration between different professional groups, including services of school social work which have recently been established in many Swiss schools. Yet, little research has examined how school social workers collaborate with relevant actors within schools. The present study addresses this gap by exploring the existing forms of collaboration between school social workers, principals and teachers. Based on an interdisciplinary approach, the study identifies factors that influence interprofessional collaboration. More specifically, the study should help to achieve a better understanding of how external pressures due to social problems, resource adequacy, leadership, role perception, and the organization of social work influence the collaboration among the various actors involved. By doing so, the project will contribute to the advancement of basic research on school social work and on interagency collaboration between schools and youth welfare services. At the same time, researchers invest in facilitating the transition of knowledge from basic research to the field of practice. It is expected that the various actors will make use of research findings when reflecting their professional practice and when developing new directions for their actions. To obtain the data from several hundred schools, online surveys and paper-and-pencil questionnaires are used for data gathering. For data analysis, descriptive analyses, linear regression analysis as well as mediation analysis are performed.

Teacher-Student Relationships From Kindergarten to Sixth Grade and Students' School Adjustment

Keywords: Achievement, Educational Psychology, Social aspects of learning and teaching, Social interaction

Presenting Author:Rianne Bosman, University of Amsterdam, Netherlands; **Co-Author:**Debora Roorda, University of Amsterdam, Netherlands; **Co-Author:**Ineke van der veen, Kohnstamm Institute, University of Amsterdam, Netherlands; **Co-Author:**Helma Koomen, University of Amsterdam, Netherlands

This study used a person-centered approach to identify teacher-student relationship trajectories from kindergarten to sixth grade. Additionally, predictors of relationship trajectories and students' motivation and academic adjustment in sixth grade were examined in a Dutch sample. Teachers reported about relationships with individual students ($N = 1300$) in kindergarten, grade 3, and grade 6 (i.e., closeness, conflict, and dependency), and they provided information about externalizing problem behaviors in kindergarten. In sixth grade, students performed on math and reading tests and completed questionnaires about task motivation and self-efficacy. Latent class growth analyses demonstrated three trajectories for closeness: high and stable (normative), very high and decreasing, and moderate and increasing. For conflict, low and stable (normative), low and increasing, and high and decreasing trajectories were found. For dependency, a low and decreasing (normative) and a low and increasing trajectory were found. Boys, students with lower verbal abilities, and students with more externalizing problem behavior were overrepresented in non-normative trajectories. Students with low teacher-student closeness in kindergarten or enduring exposure to negative teacher-student relationships during elementary school (low and increasing levels of conflict and dependency), scored lower on achievement tests and motivation at the end of elementary school than students in normative trajectories.

Acquisition of hard-to-learn knowledge in the domain of geriatric care nursing

Keywords: Out-of-school learning, Peer interaction, Workplace learning, Lifelong learning

Presenting Author:Bianca Steffen, University of Paderborn, Germany; **Co-Author:**Michael Goller, University of Paderborn, Germany; **Co-Author:**Christian Harteis, University of Paderborn, Germany

This contribution aims to investigate the learning process of newly hired geriatric care nurse assistants. The main focus of this interview study with 14 German geriatric nurses was (1) to identify knowledge that is hard to learn but simultaneously highly important for the daily job as a nurse assistant as well as (2) to clarify which of this knowledge cannot be gained solely with already existing activities and strategies. First findings implicate two domains being particularly hard to learn. The findings of this study will be used to deduce practical implications of how to improve the current learning process of such nurse assistants

Different Effects of Department Prestige on Post-PhD Job Placement

Keywords: Doctoral education, Quantitative methods, Researcher education, Science education

Presenting Author:Jakob Tesch, DZHW - German Centre for Research on Higher Education and Science Studies, Germany

This paper investigates the effect of the PhD granting department's prestige on the postdoctoral job placement of PhDs. Previous studies have discussed three main types of effects of department prestige on job placement, namely prestige effects, selection effects and training effects. The study will analyze whether prestige effects are mediated by measures of past achievements and career preferences as measures for selection and training effects. Job placement is analyzed using longitudinal data from the German Doctoral Candidates and Doctorate Holders Study ProFile. Job placement is conceptualized as placement in academic R&D in comparison to placement in other sectors, the change in university after the PhD and job income. Prestige is conceptualized using data on visibility of research output from the Leiden Ranking. Both data sources - Leiden Ranking and ProFile - will be matched and multi-level regression models will be computed to assess the effect of prestige on job placement while controlling for career preferences, PhD grades and earlier achievements.

Lifelong learning policies and their implications for young adults at risk in Germany

Keywords: At-risk students, Educational policy, Vocational education, Lifelong learning

Presenting Author:Alina Florentina Boutiuc-Kaiser, University of Education Freiburg, Germany

This paper explores how lifelong learning (LLL) policies influence or change the individual life projects of youth and young adults at risk like students at risk of leaving school, with migration background, early school leavers, youth and young adults not in school nor in training (NEETs), single parents, etc. As these groups are heterogeneous their living conditions, their

position in the education system or in the transition school to work and their freedom and autonomy in biographical decisions vary at local and regional German level substantially. In many cases the LLL policies push youth and young adults at risk to assume standardized life projects according to economic needs, and thus create new life course normality expectations forgetting to take into account individual specific contexts and the fact that life courses became more and more de-standardized.

Supporting sustainable professional development in teachers implementing STEM education

Keywords: Design based research, Primary education, Science education, Teacher Professional Development

Presenting Author: Mireille Hubers, University of Twente, Netherlands; **Co-Author:** Maaïke Endeldijk, University of Twente, Netherlands

Globally, there is an increasing focus on teaching all students Science, Technology, Engineering and Mathematics (STEM) from primary education onwards. This resulted in many professional development programs that aim to support teachers in providing such content to their students. However, it is challenging to sustainably change the way in which teachers' incorporate STEM in their curriculum. To gain more insight into this sustainability challenge, the present study aims to determine 1) what factors influence the sustainability of STEM interventions, 2) how the development of such factors can be monitored, and 3) what the design requirements are for instruments assessing sustainability. The present design-based study focused on five interventions that target the way in which teachers use STEM in their daily educational practice (e.g., stimulating students' 21st century skills). These interventions were selected in collaboration with the Dutch national centre of expertise in STEM education ("Tech Your Future"). For each intervention, the principal investigator and two participating schools were included in the present study. A semi-structured interview scheme was used to individually interview the participants. Member-checks were performed to ensure the correctness of the interpretations. Amongst other things, school leadership, resources and teachers' knowledge and attitudes about STEM were found to be important factors influencing teachers' professional development. Moreover, in measuring sustainability, attention should be paid to the degree to which elements of the professional development program are implemented (e.g., through using student evaluations). The theoretical and practical implications of these findings will be discussed.

Fostering teacher trainees' assessment skills with real-life learning tasks

Keywords: Competencies, Design based research, Instructional design, Pre-service teacher education

Presenting Author: Christiane Klein, University of Freiburg, Germany; **Co-Author:** Stephanie Herppich, University of Freiburg, Germany; **Co-Author:** Matthias Nückles, University of Freiburg, Germany; **Co-Author:** Joerg Wittwer, University of Freiburg, Germany

Assessing students in classroom teaching is a complex skill. Consequently, its acquisition in teacher preparation requires trainings that emphasize the complex nature of assessing students. The 4-Component-Instructional-Design (4C/ID) model developed by van Merriënboer (1997) is an evidence-based approach to the training of complex skills. At the heart of this model is the use of holistic real-life learning tasks. So far, the 4C/ID model has not been applied for learning assessment skills in German teacher's training programs. Thus, we designed a long-term training for acquiring assessment skills based on this model. The training possesses two central elements, namely, learning tasks that address variable authentic assessment situations and a development portfolio to support and continuously monitor skill acquisition. To evaluate the extent to which the training fosters learning, we plan to compare teacher trainees who participate in the training with teacher trainees who take part in a training that is not designed in accordance with 4C/ID principles. Moreover, to examine the process of skill acquisition in more detail, we analyze the development portfolios. Based on the data collected, we will discuss the potential of the designed training to promote assessment skills and provide insights into the processes involved in acquiring the complex skill of assessing students.

Mindsets About Inclusion. A Comparison Between Concept Maps of German and Finnish Student Teachers

Keywords: Comparative studies, Conceptual change, Pre-service teacher education, Special education

Presenting Author: Franziska Greiner, Friedrich Schiller University of Jena, Germany; **Co-Author:** Baerbel Kracke, University of Jena, Germany

The struggle between policy and education features strongly in the discourse about inclusion. On the one hand there is a clear requirement on the German education system since the 2009 ratification of the Convention on the Rights of Persons

with Disabilities (CRPD); and on the other German teachers' and student teachers' thinking and action is influenced by a long tradition of a selective school system and society. In contrast to Germany, Finland's education system is known as model example. Maybe this could be explained through Finland's ten year head start (see Comprehensive Instruction Law of 1999) has allowed for more time to develop open mindsets and elaborate knowledge structures. Using concept maps – a method which is verified to be effective for usefully indicating students' mentality and its structure (Reiska et al., 2008) – the presentation will compare the knowledge structures and mindsets of German and Finnish student teachers. Using qualitative variables (e.g. structure complexity and proposition choice) and quantitative variables (e.g. number of concepts and propositions) in comparing constructed concept maps it will be seen whether Finnish student teachers have more differentiated, elaborate and well-structured concept maps than German students.

The SMI Digital Classroom. A multi-station data collection framework for educational research.

Keywords: Computer-assisted learning, Educational Psychology, Student learning, Technology

Interest group: SIG 27 - Online Measures of Learning Processes

Chairperson: Fabian T. C. Schmidt, Leibniz Institute for Science and Mathematics Education (IPN), Germany

SMI SensoMotoric Instruments GmbH (Berlin, Germany) has launched SMI Digital Classroom, an integrated framework for educational research on behavioral correlates of attention, learning and memory based on eye tracking and connected physiological sensors. The SMI Digital Classroom promises a wealth of behavioral data about temporal and spatial characteristics of student behavior when interacting with screen-based educational material. You can, for example, assess what works in a classroom environment and what doesn't, where and when students' attention is won and lost. The solution has been designed specifically for researchers interested in students' individual learning strategies during knowledge acquisition and retrieval, teacher expertise and classroom management skills as well as content improvement and development of truly adaptive learning environments. One researcher, located at a single PC, can deploy behavioral experiments to up to 40 student laptops or computers, monitor student progress, interact with single students if required via messages and alerts, and monitor incoming research-grade data quality. No matter if all students are accomplishing the same experimental protocol, or if every student is provided with distinct learning content, the SMI Digital Classroom allows for automatic data synchronization and aggregation, allowing you to get to results immediately after data collection. The framework doesn't require deep technical or methodological expertise, allowing also educational researchers new to the field of eye tracking and physiological sensor acquisition to focus on scientific hypotheses and gain insights that shape student-centered training schemes, curriculum and learning strategies.

Supportive hints in a digital environment to foster adolescents' expository text comprehension

Keywords: Computer-assisted learning, Educational Technology, Learning Technologies, Reading comprehension

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Simon Beausaert, Maastricht University, Netherlands

Over the last decades the research focus in the domain of learning and instruction has shifted towards digital applications and environments. With the use of new technologies and web 2.0 most ICT programs seem promising, but often empirical research to prove their effectiveness is lacking. After conducting a scientific literature review on the topic of digitally supported middle school text comprehension programs, it was decided to design a program based on existing knowledge and specific practical needs. The researchers developed the lay-out and the content of the program in co-creation with teachers and 7th-grade students. In doing so, the result was a web-based digital environment: Gazelle. This acronym (in Dutch) stands for motivated and active self-regulated reading. Gazelle aims at fostering comprehensive reading, since many educators emphasized their students' struggle with expository texts (e.g., in geography and history, where students need to read vast amounts of text). Comprehensive reading is supported by cognitive, metacognitive and motivational scaffolds called 'hints'. The program logs students' performance, their use of hints, and their judgement of learning (JOL). At the same time, the program provides relevant output for teachers, such as an overview of student progress and results. The questions used in Gazelle are categorized based on specific skills, such as causation or recognizing the main idea. This way, teachers can not only see which students are struggling with text, but also which skills need to be developed.

Supportive hints in a digital environment to foster adolescents' expository text comprehension

Presenting Author: Marlies ter Beek, University of Groningen, Netherlands; **Co-Author:** Leonie Brummer, University of Groningen, Netherlands; **Co-Author:** Anouk Donker-Bergstra, Rijksuniversiteit Groningen, Dept of Education and GION, Netherlands; **Co-Author:** Marie-Christine Opdenakker, University of Groningen, Netherlands

Over the last decades the research focus in the domain of learning and instruction has shifted towards digital applications and environments. With the use of new technologies and web 2.0 most ICT programs seem promising, but often empirical research to prove their effectiveness is lacking. After conducting a scientific literature review on the topic of digitally supported middle school text comprehension programs, it was decided to design a program based on existing knowledge and specific practical needs. The researchers developed the lay-out and the content of the program in co-creation with teachers and 7th-grade students. In doing so, the result was a web-based digital environment: Gazelle. This acronym (in Dutch) stands for motivated and active self-regulated reading. Gazelle aims at fostering comprehensive reading, since many educators emphasized their students' struggle with expository texts (e.g., in geography and history, where students need to read vast amounts of text). Comprehensive reading is supported by cognitive, metacognitive and motivational scaffolds called 'hints'. The program logs students' performance, their use of hints, and their judgement of learning (JOL). At the same time, the program provides relevant output for teachers, such as an overview of student progress and results. The questions used in Gazelle are categorized based on specific skills, such as causation or recognizing the main idea. This way, teachers can not only see which students are struggling with text, but also which skills need to be developed.

Workshop

Learning and Instructional Technology

Using VR technology to bring more learning opportunities in STEM courses

Keywords: Design based research, Educational Technology, Inquiry learning, Science education

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Marion Crauwels, KU LEUVEN, Belgium

Promoting STEM education has been explicitly emphasized in Chinese educational policy. However, there lacks competent teachers and resources to implement STEM into science classes in schools. And the imbalanced distributions of the educational resources within China further slows down the process of implementing STEM in schools. In response, the courses based on immersive VR technology were designed and expected to bring the equal opportunities to schools for carrying out STEM programs. Based on the affordances of the VR technology, the researchers designed authentic STEM

learning programmes for students. With the development of the VR technology, especially, the popular head-mounted VR devices enable the students to explore the contexts could not be explored in the real world (expanding the space and time zone; or the interesting places with different accesses). The students can conduct observations and even data collections within the virtual world. With other real-world science tools, the students can carry out the data analysis or experiments guided by the instructors. Then the students can create their own virtual worlds to present their study results or test their hypothesis. Based on initial empirical studies, it was found that by experience the nature of scientific inquiry in various virtual contexts, the secondary schools students in China indicated more positive attitudes towards the science. The further study is carried on, such as analyzing students' academic achievement in a compared study. Therefore, this workshop invites participants to experience the VR-supported STEM courses and discuss about the integration of VR technology and STEM courses.

Using VR technology to bring more learning opportunities in STEM courses

ICT Demonstration

Teaching and Teacher Education

Responding to Student Writing Using Screencast Technology

Keywords: Student learning, Teaching / instruction, Technology, Writing / Literacy

Interest group: SIG 12 - Writing

Chairperson: Venera Gashaj, University of Bern, Switzerland

Screencast technology allows an instructor to scroll through a student's essay or other work onscreen, highlighting or marking up areas of the text while talking to the student. The result is a brief (usually 5-minute) video that the student can then watch and listen to, and replay if necessary. Research has shown that, compared to conventional written feedback, screencasts provide far more information in less time, are perceived by students far more positively, create more positive affect, and are more effective instructionally (Author, 2016; Author, in press). This interactive ICT session will first explain and demonstrate the use of screencast technology for responding to student work. Participants will then try out the technology using one of several brief pieces of student writing appropriate to the age group of their students. Several other uses for screencasting will then be demonstrated, such as the use of screencast for peer review, formative teacher response, and formal evaluation. A list of screencast programs (some free) will be provided, along with a summary of the research showing the positive outcomes of responding to student work using the technology.

ICT Demonstration

Learning and Instructional Technology

Let's talk student engagement: Connecting teachers and students using learning analytics

Keywords: At-risk students, Higher education, Learning analytics, Student learning

Interest group: SIG 04 - Higher Education

Chairperson: Sui Lin Goei, Windesheim University of Applied Sciences, Netherlands

Student (dis)engagement is a frequently debated topic in higher education worldwide. Many post-compulsory education providers invest heavily, in terms of financial and human resources, into the enhancement of student retention and success. As higher education institutions are increasingly being measured for the effectiveness of returns on students' investment, it is not surprising that attempts to measure engagement are made through national student surveys to probe success and excellence at both the student and institutional level. Learning analytics data provides a lens into engagement. However, remotely collected system log data do not provide a picture of the 'whole' student and other data such as feedback, formative assessment, attendance and student demographics may inform action in any given pedagogical context. In this ICT demonstration, participants will have the opportunity to explore hands-on a cross-institutionally developed learning analytics tool that connects teachers with all students, not just those at risk. The featured tool is underpinned by personalizing the student experience at scale via persuasive text messages which are based on teacher-defined criteria of what constitutes engagement. The aim is to enable teachers to leverage learning analytics in their own educational contexts without having to be data or IT experts. Access to the tool and examples of learner data will be provided via a cloud-based environment. During the presentation, participants will be invited to engage in discussions about how we can define, measure and encourage student engagement, considering our shared experiences as teachers, learning designers, data analysts and IT experts.

Session E 18

30 August 2017 12:00 - 13:30

Pinni B - B3110

ICT Demonstration

Learning and Instructional Technology

Music, Math, and LEGO: Using tangibles on a multi-touch table to teach abstract concepts.

Keywords: Computer-assisted learning, Instructional design, Multimedia learning, Student learning

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Benjamin Caspar Fauth, University of Tübingen, Germany

Tangibles are physical objects with embedded digital information, e.g. visualization or sound, which can be used to support the understanding of abstract concepts like fractions or musical notations. To exploit the advantages of tangibles as tools for teaching and learning not only new technologies but also new teaching methods are needed. In this demonstration we will use video examples to describe the development and implementation of such a combination of a tool and teaching

methods. In an eight weeks long extracurricular course we use tangibles on a multi-touch table (MTT) to simultaneously teach abstract mathematical as well as musical concepts. The course is based on using LEGO-like bricks of different lengths as representations for musical notes by adding digital information of sound duration to them. In combination with a music application on the MTT musical patterns (melodies, harmonies, and rhythms) can be built and played. Structural similarities between musical and mathematical patterns are used in the course to derive composing techniques from familiar mathematical operations like geometrical translations. From our research on this course we expect to gain new insights on benefits of tangibles for learning of abstract mathematical and musical concepts.

ICT Demonstration

Assessment and Evaluation

Video-based assessment of teachers' professional vision of inclusive classrooms

Keywords: Assessment methods and tools, In-service teacher education, Pre-service teacher education, Quantitative methods

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Tine Nielsen, University of Copenhagen, Denmark

Globally, schools and teachers are facing a growing diversity in student populations, which is reflected in worldwide educational policies to implement more inclusive learning environments. According to the literature, (student) teachers need to be supported in their new role as facilitators of inclusion, as they play a major role in the success of these inclusive policies. As a consequence, an important step is to increase their ability to recognize and interpret effective teaching strategies in dealing with student diversity. This is conceptualized by Stürmer, Könings and Seidel (2013) as professional vision. Researchers have relied extensively on video as a means for studying professional vision. One way to study professional vision through video is the method of comparative judgement. However, the method of comparative judgement has not yet been applied to study (student) teachers' professional vision through video. Therefore, the project "POTENTIAL – Power to teach All!" developed a video-based comparative judgement instrument to measure (student) teachers' professional vision of inclusive classrooms. Two validation studies - an expert study and pilot study - took place to inquire the validity of the instrument. Results of both studies confirm the validity of the videography instrument to measure (student) teachers' professional vision of inclusive classrooms in a standardized way. This instrument will be presented during the ICT demonstration.

Main Building A - A05

Workshop

Higher Education

Exploring pedagogical and curricular decisions for research based activities across Europe.

Keywords: Higher education, Synergies between learning - teaching and research, Teacher Professional Development, Teaching approaches

Interest group: SIG 04 - Higher Education

Chairperson: Miriam Sarid, Israel

Undergraduate research in higher education receives more and more attention. For both approaches there exist several models and typologies aiming to put different characteristics of research based learning into order (e.g. Healey & Jenkins 2009, Brew 2013, Levy & Petrulis 2012, Huber 2014, Stang 2016). Angela Brew has criticized that most models do not differentiate between curriculum and pedagogy (Brew 2013). As a response to this critique Brew developed herself “a framework for curricular and pedagogical decision-making” (Brew 2013) that she claims to be holistic.

We have analyzed Brews model and developed it further to separate more clearly the curriculum and the pedagogy. Our new model will be the core element of the workshop. Through this workshop we want participants a) to become acquainted with a framework for pedagogical and curricular decision making on research-based learning based on the model by Angela Brew (2013) and further developed by Lübcke, Reinmann & Heudorfer (2016, unpublished), b) to discuss the “typical” level of autonomy given to students with regard to design and perform research in their respective countries, and c) to discuss the “typical” level of autonomy given to teachers in designing research-based learning activities in their respective countries

ICT Demonstration

Assessment and Evaluation

A Digital Platform for the Assessment of Competences (D-PAC)

Keywords: Assessment methods and tools, Competencies, Educational Technology, Psychometrics

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Tommi Kokkonen, University of Helsinki, Finland

To ensure the development of competences in education, performance assessments are key. In these assessments, students are asked to create a (written) product or to give a presentation. Evaluating performance assessments is problematic, however, as assessors differ in how they interpret and use rating criteria. As a result, analytic scoring procedures, which are traditionally used for the rating of performance assessments, face problems in reliability and validity. Therefore, D-PAC introduces a digital tool that uses pairwise comparisons as an alternative scoring method. According to

the law of comparative judgement (Thurstone, 1927), people are far more reliable in comparing the quality of two performances, than in making absolute judgements about the quality of a single performance. Moreover, by including multiple assessors, who all have their own perspectives of what a quality performance comprises, the validity of this method is warranted. Based on the pairwise comparisons of all assessors, the tool provides a rank-order of students' performances. So far, 26 user groups used D-PAC for the evaluation of performance assessments in a wide variety of domains. Results from these try-outs indicate that D-PAC is a credible tool. In general, D-PAC ratings were more reliable and valid than analytic ratings. Further, D-PAC can be used to promote learning, by providing feedback to both students and assessors. In this ICT session, the different functionalities of D-PAC will be demonstrated and the possibilities and drawbacks of using D-PAC for research and educational purposes will be discussed.

Learning and Instructional Technology

New era of collaboration – Demonstrating conversational knowledge creation technology

Keywords: Design based research, Educational Technology, Knowledge creation, Learning Technologies

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Els Boshuizen, Open University of the Netherlands, Netherlands

The demonstration shows how a new software prototype (designed in Engaging Working Culture Project) supports new era of collaboration; digitally mediated conversational knowledge creation. Prototype helps participants to create shared artefacts in order to develop new understanding both individually and collectively. This EWC prototype was designed based on student-activating inquiry-, project- and problem-based approaches to learning and de. Especially, focusing on 1) activate and diagnose, 2) support the learning process and 3) evaluate the changes in thinking and acting *Engaging Learning Model* (Lonka, 2012). Phases are supported by constant feed forward by peers and the teachers. The EWC prototype can be used in various organizations and educational institutions to improve knowledge creation practices. Our working hypothesis is that this EWC prototype may accelerate learning processes by making conceptions overt to discussion and reflection. First pedagogical pilot group of this design-based study were eight math and science student teachers. The actual software testing was carried out during a brief study period. In the beginning, participants filled in a questionnaire. The sessions were filmed and observed and learning journals were also written. Feedback and evaluation conversations took place during the piloting period. It appeared that our EWC software solution provided a new kind of social plane for discussion and socially shared understanding. The participants were instantly able to make use of the possibilities of the EWC prototype. The participants of EARLI ICT demonstration can test the prototype and experience its effects in practice.

ICT Demonstration

Learning and Instructional Technology

Classroom data management and interactive teaching with OneNote and EverNote: ICT Demonstration

Keywords: Computer-supported collaborative learning, E-learning / Online learning, Learning Technologies, Technology

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Anne-Elina Salo, University of Turku, Finland

ICT (information and communication technology) has become a vital component of our professional and private life (Tulodziecki/Herzig/Grafe 2010, 13). With School 4.0, Industrialization 4.0, Digital Transformation and ICT Literacy the new digital media is now also conquering the classrooms. Teachers and human resource developers in the vocational sector work on new opportunities to benefit from the advantages of tablet classes, BYOD (bring your own device concepts) and CYOD (choose your own device) on both sides of the dual education system (Dormann/Schmieden/Gerholz 2016, 52). Furthermore, this development reflects the influence of ICT on the students' acquisition of job-related competences for their future profession. So far the use of ICT in classes and the ICT competences of students seem to be expandable (ICILS 2013[1]). One reason for the poor amount of integration of ICT in classes is the lack of feasible didactic concepts (BITKOM 2011, 30). Particularly, in tablet classes and ICT-test programs in schools OneNote or EverNote are appropriate software to support ICT. Both software programs are mainly cloud based teaching solutions. The participants of this ICT demonstration will experience the diverse opportunities of working with OneNote and EverNote in classrooms. Both tools are largely unknown software programs of Microsoft and Apple and provide a variation of opportunities for teachers and educators. It will also be possible to integrate BYOD concepts into the demonstration. In an interactive exchange the participants will evaluate and criticize the presented software.

[1] The data of the study was based on younger students but it seems to be transferable in many ways.

30 August 2017 12:00 - 13:30

Engaging Global Business Education – How to implement innovative digital pedagogical practices?

Keywords: Computer-supported collaborative learning, E-learning / Online learning, Educational Technology, Technology

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Anne Milatz, University of Jena, Germany

In this demonstration you will learn how to implement innovative pedagogical practices that meet the latest requirements of education (Finnish National Board of Education, 2015; European Parliament, 2015). This will be actualized via a pedagogical system that has been designed into a digital platform to create an engaging learning environment. This environment provides the possibility to implement 21st skills, student-activating learning practices and business-related education into high-school courses. Furthermore, the solution provides a network to link working life and educational institutes as well as various events to foster the educational objectives, for example *Slush Youth Exhibition* in Finland. *Engaging Global Business Education* (EGBE) is an ambitious attempt to design technology-mediated pedagogical practices based on the *Engaging learning model* (Lonka, 2012) to bridge the gap between formal education and the needs of future work life. The practices together with corresponding material will be integrated into high school education through a user-friendly and advanced digital learning environment (provided by Claned Ltd). At the moment, 12 high-schools all around Finland are involved in the piloting phase of the project. Based on the outcomes of the testing phase, four global business courses for high-school students are going to be ready to use in 2017. In future, the aim is also to implement customized versions of the courses to primary education, higher education and even companies. During this demonstration you will also hear about the first waves of feedback, which has been very promising so far.

Engaging Global Business Education – How to implement innovative digital pedagogical practices?

This will be actualized via a pedagogical system that has been designed into a digital platform to create an engaging learning environment. This environment provides the possibility to implement 21st skills, student-activating learning practices and business-related education into high-school courses. Furthermore, the solution provides a network to link working life and educational institutes as well as various events to foster the educational objectives, for example *Slush Youth Exhibition* in Finland. *Engaging Global Business Education* (EGBE) is an ambitious attempt to design technology-mediated pedagogical practices based on the *Engaging learning model* (Lonka, 2012) to bridge the gap between formal education and the needs of future work life. The practices together with corresponding material will be integrated into high school education through a user-friendly and advanced digital learning environment (provided by Claned Ltd). At the moment, 12 high-schools all around Finland are involved in the piloting phase of the project. Based on the outcomes of the testing phase, four global business courses for high-school students are going to be ready to use in 2017. In future, the aim is also to implement customized versions of the courses to primary education, higher education and even companies. During this demonstration you will also hear about the first waves of feedback, which has been very promising so far.

Session E 25

30 August 2017 12:00 - 13:30

Main Building A - A31

Workshop

Motivational, Social and Affective Processes

Positive pedagogy as a tool in the digital communication between teachers and custodians

Keywords: Mixed-method research, Motivation, Primary education, Values education

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Katrien Cuyvers, University of Antwerp, Belgium

Keywords: Mixed-method research, Primary school, Values education, Social interaction This paper describes a positive pedagogy intervention in 7 primary school classrooms. The main focus is on teaching character strengths and highlight the positive and supportive communication between teachers and custodians. The Finnish educational reform of the national curriculum 2016 highlights the importance of active and positive collaboration between schools and custodians in order to support students. Positive communication is a key to co-operation with schools and families (Barge & Loges, 2003; Martin & Hagan-Burke, 2002). Schools and families should build trust, equality and mutual respect between one another in order to help students in the best possible way (Kumpulainen et al., 2014). Both, parents and teachers identify trust as a vital component of effective family-school relationship (Dunst, Johanson, Rounds, Trivette, & Hamby, 1992) and effective communication is the requirement for building trust (Adams & Christenson, 2000). According to new curriculum, schools should also confirm the capability of students by recognizing and using their strengths (Finnish National core curriculum 2014). Highlighting and communicating about strengths also creates a solid base in the collaboration between schools and

parents (Sointu, 2014).

Positive pedagogy as a tool in the digital communication between teachers and custodians

Session E 26

30 August 2017 12:00 - 13:30

Main Building E - E350

Workshop

Learning and Instructional Technology

Quality of MOOCs: Results of research surveys and discussion of MOOC Quality Reference Framework

Keywords: E-learning / Online learning, Informal learning, Learning Technologies, Survey Research

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Brigitte Rollett, University of Vienna, Austria

This interactive workshop addresses the quality of Massive Open Online Courses (MOOCs) and is organized by MOOQ, the European Alliance for Quality of MOOCs. Main goals of the interactive MOOQ workshop are: (1) the discussion of the results from the four online surveys, and (2) the presentation and discussion of the Quality Reference Framework (QRF) for MOOCs based on extensive desktop research and literature reviews and the results from the online surveys with four groups of target audiences: MOOC learners, designers, implementers, and providers.

Leading question is: How can the findings from the four online surveys and the new QRF improve future MOOCs? The interactive workshop of 90 minutes combines different methods: In the first short part, the results of the four online surveys are presented and discussed in a question-and-answer session. In the second part (60 minutes), the QRF developed by MOOQ is briefly introduced and afterwards debated in detail in an Interactive World Cafe: All quality dimensions and their indicators are investigated how they fit and contribute to improve the quality of MOOCs for learners, designers, providers and decision makers. The results from the small groups on quality dimensions are presented and integrated in plenary. Finally, next steps towards future collaboration and activities are explored by all participants.

Intended audiences are all experts, practitioners and novices sharing interest in Open Education and the quality of MOOCs: Contributions by conference participants as well as by online participants commenting via twitter are most welcome and encouraged.

EARLI Keynote Session

Learning and Instructional Technology

The Power of Learning Analytics: Is There Still a Need for Educational Research?

Keywords: E-learning / Online learning, Educational Technology, Learning analytics, Quantitative methods

Interest group: SIG 27 - Online Measures of Learning Processes

Chairperson: Eleni Kyza, Cyprus University of Technology, Cyprus

Across the globe many institutions and organisations have high hopes that learning analytics can play a major role in helping their organisations remain fit-for-purpose, flexible, and innovative. A broad goal of learning analytics is to apply the outcomes of analysing data gathered by monitoring and measuring the learning process. Learning analytics applications in education are expected to provide institutions with opportunities to support learner progression, but more importantly provide personalised, rich learning on a large scale. Substantial progress in learning analytics research has been made in the last few years. Researchers in learning analytics use a range of advanced computational techniques (e.g., Bayesian modelling, cluster analysis, natural language processing, machine learning) for predicting which learners are likely to fail or succeed, and how to provide appropriate support in a flexible and adaptive manner.

In this keynote, I will argue that unless educational researchers at EARLI embrace some of the key principles, methods, and approaches of learning analytics, educational researchers may be left behind. In particular, a main merit of learning analytics is linking large datasets of actual learning processes and outcomes with learning dispositions and learner characteristics. Using evidence-based approaches rapid insights and advancements are developed how learning designs and learning processes can be optimised to maximise the potential of each learner. For example, our recent research with 151 modules and 133K students at the Open University UK indicates that learning design has a strong impact on student behaviour, satisfaction, and performance. Learning analytics can also drive learning in more “traditional”, face-to-face contexts. For example, by measuring emotions, epistemological expressions, and cross-cultural dialogue, social interactions can be effectively supported by innovative dashboards and adaptive approaches. I aim to unpack the advantages and limitations of learning analytics and how EARLI researchers can embrace such data-driven research approaches.

Educational Policy and Systems

Evidence-based Education and the Role of Teacher Education

Keywords: Educational policy, Quantitative methods, School effectiveness, Teacher Effectiveness

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Daniel Muijs, University of Southampton, United Kingdom

During the last decades, educational policy has turned towards evidence-based decisions. Evidence helps to identify problems early, serves as a basis for planning, gives feedback on developments or justifies programmes. Educational policy also follows with interest what research is finding out, e. g. about conditions of successful schooling. Even when researchers conclude that the quality of teaching is more important than the quality of school structures, politicians may get convinced. Consequently, they suppose that scientific evidence could help to improve educational practice. This hope is still shared by teachers who may want to know e.g. how to cope with the increasing diversity in their classrooms. What are implications of these observations? First of all, it seems that fundamental debates on evidence-based education have become obsolete. Nevertheless, we still have to discuss approaches and methods for synthesizing findings. And we have to continue and intensify research on “what works” in education. Before this background my presentation will focus consequences of the shift towards evidence-based education for teacher training. Teacher education can play a key role for the successful implementation of evidence-based education; but strategies are needed to address these new challenges. In order to discuss such strategies, possible functions of teacher education for evidence-based education should be differentiated. Teacher education could be adjudicated e.g. the function of a filter (critical analysis of evidence), the responsibility of qualifying teachers in initial teacher training as well as across their career, the task of implementing evidence (in materials, tools, technologies). Last but not least, teacher education has to take care that teachers learn to decide responsible-minded and in line with professional standards of a goal- and value-oriented education. Based on that, some specific challenges shall be addressed in the end: Teacher education has to develop competence in target- group-specific science communication. And could teacher education benefit from approaches of translational research?

EARLI Keynote Session

Cognitive Science

Eye Follow You: Effects of Gaze Cues on Learning

Keywords: Educational Psychology, Educational Technology, Instructional design, Multimedia learning

Interest group: SIG 27 - Online Measures of Learning Processes

Chairperson: Hans Gruber, University of Regensburg, Germany

In this keynote I will present the findings from a five-year research project about the effects of gaze cues on learning (funded by a NWO Vidi grant – what’s in a name).

Other people’s faces, and especially their eyes, are real attention magnets. Eyes quickly and automatically capture our attention, and this mechanism presumably evolved because eye gaze provides us with very powerful social cues that help us understand the intentions of others.

In this project, we investigate whether we can use gaze cues to improve learning from video modeling examples, in which

a model (instructor) demonstrates and explains how to perform a task.

I will discuss research on the effects of both direct gaze cues (i.e., the model's eyes/head turn towards the task) and indirect gaze cues on attention and learning. Indirect gaze cues are created by recording the model's eye movements and displaying them as, for instance, circles or dots overlaid on the video.

Both types of gaze cues are expected to help synchronize the students' with the model's attention, which should help students follow the model's explanation. Therefore, this 'joint attention' is expected to enhance students' learning from video modeling examples—at least under conditions in which the explanation would otherwise remain unclear.

Last but not least, I will present studies on how gaze displays are interpreted. We may be naturally attuned to direct gaze, but can we correctly infer the intentions and thoughts of others from a moving circle or dot? Come and see for yourself!

Eye Follow You: Effects of Gaze Cues on Learning

Single Paper

Higher Education

Higher Education

Keywords: Achievement, Assessment methods and tools, Cognitive skills, Competencies, Content analysis, Higher education, Instructional design, Quantitative methods, Reflection, Student learning, Survey Research, Synergies between learning - teaching and research

Interest group: SIG 04 - Higher Education

Chairperson: Lotta Uusitalo-Malmivaara, University of Helsinki, Finland

Non-cognitive skills as admission criteria for university: A systematic review

Keywords: Achievement, Assessment methods and tools, Cognitive skills, Higher education

Presenting Author: Tine Nielsen, University of Copenhagen, Denmark; **Co-Author:** Ida Sophie Friderichsen, University of Copenhagen, Denmark

The aim of this review was to explore which non-cognitive skills (NCS) are used as alternative admission criteria (AAC) to higher education, that is alternative to grade point average, and the benefits of using NCS for this purpose. A systematic search of the databases REX, PsycINFO, ERIC and Google Scholar resulted in a pool of 809 studies. A screening according to five inclusion criteria resulted in a final number of 46 studies investigating 9 different readily defined NCS as AAC and a further 11 different NCS-like AAC. Analyses showed that NCS in most studies were able to predict academic performance at university and that NCS had an attrition protective effect resulting in fewer students dropping out. The NCS and NCS-like AAC that predicted academic performance at university the best were found to be self-efficacy and admission interviews. The NCS and NCS-like AAC that most strongly predicted attrition at university were found to be personality traits and a secondary quota procedure with diverse content. The findings of this review emphasize why it is important to study NCS as admission criteria within a higher educational context. Thus, using NCS as a sole admission procedure or in combination with cognitive measures holds promise both research-wise and in relation to student performance and

attrition. Keywords: Review, non-cognitive skills, admission criteria, higher education, academic success, dropout

The R-Comp - A New Instrument to Assess University Students' Research Competences

Keywords: Competencies, Higher education, Quantitative methods, Synergies between learning - teaching and research

Presenting Author: Franziska Boettcher, Freie Universität Berlin, Germany; **Co-Author:** Felicitas Thiel, Freie Universität Berlin, Germany

University students' research competences can be encouraged by *research oriented teaching*. The purpose of this study is to introduce a valid instrument for the evaluation of *research oriented teaching* in higher education in various academic disciplines. This new instrument (*R-Comp*) has been developed on the basis of the *RMRC-K-model* (Authors, 2014) consisting of five dimensions: skills in reviewing the state of research, *methodological skills*, skills in reflecting on research findings, communication skills, and content knowledge. In order to examine the underlying factor structure of the R-Comp, factorial validation was performed. Data were collected from 391 university students in their Bachelor's or Master's degree and PhD programs from various academic disciplines. Results of confirmatory factor analyses showed first evidence for the instrument's intended factor structure. Sub-dimensions could be identified for all dimensions. There is some first evidence of a valid assessment of student research competences on the basis of a generic competence model. Future directions as well as potential application contexts are presented.

Development and validation of the Reflection in Business Education Questionnaire (RIBEQ)

Keywords: Higher education, Reflection, Student learning, Survey Research

Presenting Author: Luci Gommers, University of St.Gallen, Switzerland; **Co-Author:** Tobias Jenert, University of St.Gallen, Switzerland; **Co-Author:** Taiga Brahm, University of Tübingen, Germany; **Co-Author:** Dietrich Wagner, University of St.Gallen, Switzerland

Student reflection is considered both a crucial feature of high-quality learning as well as an important objective in Higher Education. Despite its apparent relevance for educational practice, most of the research on reflection remains at a conceptual level (Boud & Walker, 1998; Mann, Gordon & MacLeod, 2007), whilst empirical research mainly focuses on measuring students' reflection levels. There is little empirical evidence going beyond case studies and qualitative accounts, regarding the effectiveness of specific interventions (e.g. portfolios) to develop reflective skills. Thus, the purpose of this research was to develop and validate an instrument for measuring student reflection in Higher Education in general and business schools in particular. The questionnaire is designed to measure students' reflection in three dimensions: students' reflection levels, their attitudes towards reflection, and supporting and hindering factors influencing students' reflection processes. A pre-test was conducted at two different universities in Switzerland and Germany to validate the Reflection in Business Education Questionnaire (RIBEQ). In total, 64 students filled in the survey. Exploratory factor analyses and reliability tests showed satisfactory psychometric qualities of the RIBEQ. This study can support further research on student reflection and its development. Also, the questionnaire can be used as a diagnostic instrument for business schools to trace students' development over time. From a practical point of view, it can also be applied to identify supporting and hindering factors at a particular higher education institution in order to develop practical interventions targeting these factors.

Key situations in service learning initiating reflection on civic engagement

Keywords: Content analysis, Higher education, Instructional design, Reflection

Presenting Author: Karl-Heinz Gerholz, University of Bamberg, Germany; **Co-Author:** Silvia Leicht, University of Bamberg, Germany; **Co-Author:** Andreas Rausch, University of Mannheim, Germany

Service learning can be described as an educational tool that is characterised by students giving service to the community and having a learning experience. Previous research has shown that service learning has the potential to promote personality development, especially in the sense of a sensitization for civic engagement. However, the findings of the empirical studies are ambiguous. While some findings show that service learning can foster an understanding of social issues and attitude to be engaged, others revealed no such effect. The reason for these inconsistent findings could be related to the applied method. The considered studies have focused more on in a retrospective manner rather than on a process-oriented approach. In order to get a deeper understanding of the parameters relevant for sensitization, focusing on the process is very promising. Through a service learning course, the students may be confronted with social issues in different ways with different persons at different places. The aim of the present study is therefore to identify key situations and experiences that initiate thinking about civic engagement as a basis for sensitization. First results indicate that there are two main kinds of situations that initiate the reflection on civic engagement – social interaction and problem solving activities.

Session F 2

30 August 2017 15:45 - 17:15

Linna - K103

Single Paper

Teaching and Teacher Education

Teacher Education

Keywords: Argumentation, Collaborative Learning, Content analysis, Conversation / Discourse analysis, Higher education, In-service teacher education, Lifelong learning, Pre-service teacher education, Problem solving, Qualitative methods, Quantitative methods, Self-efficacy, Teacher Professional Development, Teaching / instruction, Teaching approaches

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Merel van der Wal, Radboud University Nijmegen, Netherlands

Teacher resilience in adverse contexts: Issues of professionalism and professional identity

Keywords: In-service teacher education, Teacher Professional Development, Teaching approaches, Lifelong learning

Presenting Author: Maria A. Flores, University of Minho, Portugal

Over the last fifteen years or so, resilience has emerged as a field of research, not only in countries that experience high rates of attrition, but also in contexts in which the teaching profession has gone through policy and social changing circumstances affecting its social and economic status. This paper presents data from a wider funded research project aimed at examining existing conditions for teacher leadership and professional development in challenging circumstances. A mixed-method research design was devised. The project included a national survey in which 2702 teachers participated (phase I); semi-structured interviews to principals in 11 schools located in different regions of the country; focus group to 99 teachers and focus group to 108 students (phase II) and a professional development programme in 5 schools located in northern Portugal, in which 66 teachers participated (phase III). Findings highlight teachers' strong professional values, their sense of professionalism and their capacity for resisting and for being resilient (despite negative policy environment) as well as their sense of identity as teachers emerged from the data in explaining teacher resilience. The relational and affective dimension of teaching was highlighted in teachers' accounts and it was of paramount importance as a key source of motivation (despite the external factors leading to lack of motivation such as lack of career prospects, salary cuts, worsening of working conditions and unemployment), resilience and hope in teaching.

“Better ask critically...” – A training in critical argumentation for pre-service teachers.

Keywords: Argumentation, Collaborative Learning, Conversation / Discourse analysis, Pre-service teacher education

Presenting Author: Elisabeth Mayweg-Paus, University of Münster, Germany; **Co-Author:** Monja Thiebach, University of Münster, Germany; **Co-Author:** Regina Jucks, WWU Münster, Germany

Critical questioning is crucial for being able to successfully construct knowledge within collaborative argumentation on science-related issues. Regrettably, laypeople often lack the required skills and intrinsic motivation to do so. In a 1 x 2 between-subjects design (training vs. no training), the present study investigated if training the members of a dyad on critical questioning individually promotes their critical questioning behavior in discourse and their subsequent argumentation behavior. Results of content analyses show corresponding beneficial effects of the training. Furthermore, analyses revealed a marginal positive effect of the training on general critical thinking scores. The training also succeeded in ensuring students' intrinsic motivation. Implications for developing further trainings to promote critical argumentation and critical thinking are discussed.

What Factors Predict Teachers' Problem-Solving and Their Seeking of Social Support?

Keywords: Problem solving, Quantitative methods, Self-efficacy, Teaching / instruction

Presenting Author: Stephan Kielblock, Justus Liebig University Giessen / Macquarie University Sydney, Germany;

Presenting Author: Amina Fraij, Justus Liebig University Giessen, Germany; **Co-Author:** Jeremy Monsen, Tri Borough Consortium of Educational Psychologists (ELCEP), United Kingdom; **Co-Author:** Oliver Böhm-Kasper, Bielefeld University, Germany; **Co-Author:** Vanessa Dizinger, Bielefeld University, Germany

Teachers are critical to the delivery of high-quality instruction which facilitates effective pupil learning outcomes. The need for teachers' to be rigorous and systematic as they go about solving real world classroom problems is emphasised in the literature. Other studies stress the importance of the social dimension in supporting effective teacher problem-solving. This study asked what factors impact upon teachers' reported responses to stressful classroom situations: problem-solving and/or seeking social support. A large number of German teachers (n=1783) were surveyed in 2008 as part of a project looking at collaboration and stress. This data was analysed statistically. Results showed that teacher problem-solving is predicted by level of self-efficacy and effectiveness of classroom management, whereas seeking social support is predicted by self-efficacy, gender and years of teaching experience.

Student teachers' beliefs of an ideal teacher training at the university

Keywords: Content analysis, Higher education, Pre-service teacher education, Qualitative methods

Presenting Author: Barbara Moschner, Carl von Ossietzky Universität Oldenburg, Germany; **Co-Author:** Juliane Schlesier, University of Oldenburg, Germany; **Co-Author:** Uta Wagener, University of Oldenburg, Germany; **Co-Author:** Monika Reimer, Carl von Ossietzky Universität Oldenburg, Germany; **Co-Author:** Iris Lüschen, Carl von Ossietzky Universität Oldenburg, Germany

There is hardly any research that addresses the issues of teacher education from the students' perspective. Therefore our study explores ideas of teacher education students in regard to an ideal curriculum and organization of teacher education at the university. The sample consisted of 170 students, aged 20 to 42. 120 students participated in 22 focus groups and 50

students were interviewed. The resulting audio and video data was transcribed and analyzed using the method of content analysis according to Mayring (2015). The summarizing content analysis shows four main categories concerning (1) practical experiences, (2) organizational aspects, (3) study regulations, and (4) suggestions for improvement. The results show, that teacher education students have a strong desire to have more learning experiences directly in the schools. Another key aspect related to an ideal study plan in their opinion was a better organization of the schedule and the modules. Possible consequences of these results are discussed in regard to a better teacher education curriculum.

Session F 3

30 August 2017 15:45 - 17:15

Main Building C - C8

Single Paper

Assessment and Evaluation, Higher Education, Lifelong Learning, Teaching and Teacher Education

Professional Development and Workplace Learning

Keywords: Assessment methods and tools, At-risk students, Collaborative Learning, Communities of learners, Informal learning, Mixed-method research, Quantitative methods, Secondary education, Self-efficacy, Social interaction, Teacher Professional Development, Video analysis, Workplace learning

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Marc Stadtler, University of Münster, Germany

Video-based comparative judgement as a method to measure teachers' professional vision

Keywords: Assessment methods and tools, Secondary education, Teacher Professional Development, Video analysis

Presenting Author: Iris Roose, Ghent University, Belgium; **Co-Author:** Piet Van Avermaet, Ghent University, Belgium; **Co-Author:** Wendelien Vantieghem, Vrije Universiteit Brussel (VUB), Belgium; **Co-Author:** Ruben Vanderlinde, Ghent University, Belgium

Professional vision has been identified as an important element of teacher expertise (Sherin & Van Es, 2009). Professional vision is defined as teachers' ability to recognize and interpret effective teaching strategies (Stürmer et al., 2013). Researchers have relied extensively on video to study professional vision. However, the method of comparative judgement through video has not yet been applied to study teachers' professional vision in a standardized way. The "POTENTIAL – Power to teach All!" Project is developing a video-based comparative judgement instrument to measure teachers' professional vision of inclusive classrooms in a standardized way. The first part of the paper outlines the development of the video-based comparative judgement instrument. The conceptual model of teachers' professional vision of inclusive classrooms, the method of comparative judgement and the framework for validating the instrument is described. The second part presents two studies as a first step in the validation of the instrument. The first study is an expert study ($n > 45$) to inquire the validity of the content of the videos and investigate whether different types of experts come to a different ranking of the videos. The second study is a pilot with teachers from secondary education ($n > 30$) to provide evidence for the structure of the instrument and the response processes. On the basis of these two studies, further investigation of the use of video-based comparative judgement as a method to study teachers' professional vision is discussed.

On the determinants of (in)formal learning of teachers : A cross-sectional mixed-method study

Keywords: Informal learning, Mixed-method research, Teacher Professional Development, Workplace learning

Presenting Author: Antoine Lecat, Université catholique de Louvain (UCL), Belgium; **Co-Author:** Simon Beausaert, Maastricht University, Netherlands; **Co-Author:** Isabel Raemdonck, Université Catholique de Louvain, Belgium

Are our teachers able to keep up with changing insights and knowledge within their domain, are they ready for innovative didactical approaches and technological innovations? According to Dirk van Damme, The Head of the Centre for Educational Research and Innovation (CERI) of the OECD (2014) teachers in Europe do not show sufficient expertise to cope with these challenges. In other words, they have to learn to become better teachers. Given the dynamic environment of schools, investment in human capital is crucial and implies a strategic approach of supporting teachers' continuous professional development. The professional development is both formal and informal in nature, and research on teachers' informal learning is more limited (Hoekstra, Brekelmans et al., 2009). However, various studies suggest that informal learning is the most used type of learning in the workplace (e.g. Hicks, Bagg, Doyle & Young, 2007; Skule & Reichbron, 2002). This study will investigate the teachers' (in)formal learning. Questionnaires will examine relations between teachers' learnings and their antecedents (e.g. perceived job security, learning climate, teachers' experience). Furthermore, interviews will examine the reason of these relations between the variables under study. A special focus will be placed on the characteristics of informal learning through different examples.

Examining teacher self-efficacy in the context of Lesson Study practice

Keywords: Collaborative Learning, Communities of learners, Self-efficacy, Teacher Professional Development

Presenting Author: Tijmen Schipper, Windesheim University of Applied Sciences, Netherlands; **Co-Author:** Olli-Pekka Malinen, Niilo Mäki Institute, Finland; **Co-Author:** Sui Lin Goei, VU University Amsterdam, Netherlands; **Co-Author:** Siebrich De Vries, University of Groningen, Netherlands; **Co-Author:** Klaas van Veen, University of Groningen, Netherlands

This study uses a quasi-experimental design to examine whether teachers' self-efficacy levels increase as a result of

participating in Lesson Study (LS), which is a collaborative classroom- and inquiry-based professional development approach. Assuming that LS supports teachers to focus explicitly on students' learning, Bandura's theory was used to determine whether teachers feel more efficacious to execute teacher behavior related to student engagement, instructional strategies and classroom management. Given a relatively small research sample of 64 secondary school teachers and an unequal distribution of teachers in the experimental (N=44) and comparison group (N=20), non-parametric tests were used to detect differences between these groups. The intervention consisted of two Lesson Study cycles in one academic year and the overarching aim of all Lesson Study teams was to increase differentiated classroom behavior. A significant increase of teacher self-efficacy in terms of student engagement and instructional strategies was found in the Lesson Study group as opposed to no significant differences in the comparison group. This study on teacher self-efficacy adds to the growing body of mainly qualitative literature on the outcomes of Lesson Study.

Relationships between patterns of risk and success concerning the transition into labour market

Keywords: At-risk students, Quantitative methods, Social interaction, Workplace learning

Presenting Author:Anja Gebhardt, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Chantal Kamm, University of Zurich, Switzerland; **Co-Author:**Christian Bruehwiler, University of Teacher Education St.Gallen, Switzerland; **Co-Author:**Philipp Gonon, Institut für Erziehungswissenschaft, UZH, Switzerland; **Co-Author:**Stefanie Dernbach, University of Zurich, Switzerland

Referring to the high biographical and societal importance of successful transitions into the labour market, more research is needed to conduct vocational orientation processes, their underlying opportunities and support systems. This study aims at illuminating relationships between personal, familial, scholar and occupational risk factors and success indicators concerning the second transition. The analyses are based on a mixed sample design (longitudinal sample n=104, special interest sample n=302). Results show that occupational-related factors and the academic achievement at the end of compulsory school are most relevant for the second transition. Latent class analyses were run to identify patterns of risk and success. The analyses show three different success patterns, which based on theoretical and empirical considerations can be named as "average performer", "low performer" and "high performer". Furthermore with regard to various risk and protective support factors three patterns were identified, classifying the youth into groups named "good initial position and good support", "moderate initial position and bad support" and "bad initial position and good support". Based on a combination of risk and success patterns, considerations of optimizing support offers will be discussed in the presentation.

Multiple perspectives and narratives of the national past in Dutch school history textbooks

Keywords: Content analysis, History, Qualitative methods, Teaching / instruction

Presenting Author:Marc Kropman, University of Amsterdam, Netherlands; **Co-Author:**Carla Van Boxtel, University of Amsterdam, Netherlands; **Co-Author:**Jannet van Drie, University of Amsterdam, Netherlands

Scholars have discussed the need for textbooks that actively involve students in the construction of representations of the past and contribute to students historical thinking and reasoning ability. Authors of school history textbooks face the dilemma of stimulating historical thinking including the acknowledgement of multiple perspectives and critical examination of historical representations versus providing an overview of basic historical facts and concepts. Our main research question is: To what extent does narratives of the Dutch national past in school history textbooks include multiple perspectives? Two Dutch textbooks were analyzed on: a) The main components of a narrative: historical actors, time, events and developments and causal relations; b) The lexis, metaphors and rhetoric that are used in school history textbooks; c) The perspectives presented (historical sources, spatial frame, historical actors, narrative plots and dimensions of historiography). The two textbooks are in use in the intermediate stream in secondary education preparing for higher professional education. The topic analysed was the Dutch Revolt. Teachers see the Dutch revolt as very suitable for teaching multiple perspectives. Our analysis shows that the perspective taken in both textbooks is political. The focus is on political power, freedom of religion, taxes and government. The inclusion of multiple perspectives is absent in the narratives of the Dutch past. This study shows that even in a context in which multiperspectivity is emphasized as part of developing historical thinking skills and in which teachers believe it is easy to include multiple perspectives, multiple perspectives are not included in the textbooks.

Making history relevant: learning about the history of democracy through challenging group tasks

Keywords: Collaborative Learning, History, Instructional design, Metacognition

Presenting Author:Carla Van Boxtel, University of Amsterdam, Netherlands; **Co-Author:**Jaap Schuitema, University of Amsterdam, Netherlands

Teaching about the history of democracy contributes to students' ability to discuss fundamental questions about democracy and the insight that democracy is never a finished project. However, motivating students to engage in reasoning about the history of democracy can be challenging for teachers. This study investigated the potential of enriching a regular lesson unit in Dutch upper pre-university education with group tasks that aim to make history relevant and engage students in historical reasoning. We developed five design principles for group tasks: 1) Focus on substantive concepts that are part of the history curriculum; 2) Use open-ended problems or inquiry questions; 3) Make history content relevant; 4) Provide little structure, and 5) Ask for a common product. A quasi-experimental study with pre- and post test was conducted to investigate the effects. In the experimental condition (306 students, 14 classes), two-third of the textbook assignments were replaced by seven group tasks developed according to the design principles. In a case study we examined the quality of the collaborative learning process of one of the groups. Multilevel analyses showed that students in the experimental condition scored significantly higher on the post-test than students in the control group. Analysis of the interaction during three group tasks showed that the students engaged in collaborative historical reasoning and were able to regulate their work. History teachers can use the design principles to develop tasks that provide a motivating context for historical inquiry and the appropriation of concepts and insights important for participation in democratic societies.

How much politics is there? Students' understandings of the role of values in political science

Keywords: Conceptual change, Emotion and affect, Social sciences, Teaching / instruction

Presenting Author:Linda Ekström, Luleå University of Technology, Sweden; **Co-Author:**Cecilia Lundholm, Stockholm University, Sweden

One of the specific characteristics of the political science subject is the inherent existence of values. This characteristic poses a range of challenges for everyone involved in political science teaching. However, there seems to be a lack of interest on how this affects teaching political science as well as a lack of interest in how students experience this situation. In this paper we report on a study investigating how values within the discipline constitutes a learning dilemma for students with first semester under graduates. The results show how students oscillate between different ways of making sense of perceived existence of values in teaching, and use different - equally unproductive - strategies to handle the dilemma. These findings are important for advancing our understanding of learning political science, and in particular, in identifying specific learning challenges in this domain. By conducting empirical research in this area, the study also contributes to a wider discussion on the scholarship of teaching and learning political science (Craig 2014) in a fruitful way.

Students as political animals: Exploring understanding of politics in social science education

Keywords: Citizenship education, Conceptual change, Reasoning, Social sciences

Presenting Author:Cecilia Lundholm, Stockholm University, Sweden; **Co-Author:**Johan Sandahl, Stockholm University, Sweden

School subjects such as social science have versatile goals that can be described as internal and external. The internal goals are closely connected to the academic disciplines and the external goals are formulated by the political sphere and includes, among other things, the democratic values society wants students to be incorporated in as well as students engagement in public deliberation. These different goals can give birth to dilemmas for both teachers and students when they engage in highly political topics. In educational research these challenges have been discussed as epistemic cognition, motivated reasoning and conceptual change but correspond mainly to internal goals of school subjects. In order to understand the structures of the dilemmas this paper focuses on students' understanding prior to teaching and how they reason about different political views on the welfare state. The data consists of written responses, year 10 students, on two different accounts of the good welfare state, one liberal and one social democratic. The data was used to identify possible thresholds in students' analytical frames of reference, and normative reasoning. Even though several students recognise ideological ideas, few students approached the topic from a social science perspective, distinguishing facts from opinions. One key issue, possibly a threshold, is that students fail to recognise the difference between 'politics' and 'the study of politics'. The study contributes to the understanding of the influence of normativity on students' thinking and is an attempt to bridge the dilemma of combining internal and external goals of teaching and learning.

The association between educational dialogue and academic performance

Keywords: Collaborative Learning, Mixed-method research, Primary education, Social interaction

Presenting Author:Heli Muhonen, University of Jyväskylä, Finland; **Co-Author:**Eija Pakarinen, University of Jyväskylä, Finland; **Co-Author:**Helena Rasku-Puttonen, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

The association between educational dialogue and academic performance

Heli Muhonen, Eija Pakarinen, Helena Rasku-Puttonen, Anna-Maija Poikkeus, Marja-Kristiina LerkkanenUniversity of Jyväskylä

AbstractEducational dialogue is regarded as crucial for students' learning (e.g., Alexander, 2000; Mercer, 2008) but only few studies have provided clear evidence of specific learning gains associated with it. There is a need for empirical evidence on the benefits of educational dialogue to student outcomes. The aim of the study was to examine to what extent is educational dialogue associated with students' performance in academic subjects. We recorded 155 Grade 6 lessons from 46 classrooms and identified the level of the quality of dialogue and feedback from the video-recordings using the CLASS-S. The association between the quality of educational dialogue and students' grades in academic subjects were analysed using multilevel modelling. Educational dialogue was positively associated with students' grades in language arts and physics/chemistry when students' gender, parents' educational background and teacher's work experience were controlled for. In order to describe what the educational dialogues are like, language arts and physics/chemistry lessons were qualitatively analysed. Transcribed lessons were read through several times to ensure the dialogic interaction and to identify the episodes of educational dialogue. Several educational dialogues were identified relying on Alexander's (2006) five principles of dialogic teaching. The findings suggest that students' learning might benefit from educational dialogue. The results of this study are in high importance since there are only very limited previous evidence about the association between educational dialogue and students' academic performance.

School achievement: Does social behavior matter?

Keywords: Achievement, Educational attainment, Learning and developmental difficulties, Social interaction

Presenting Author:Julia Becherer, University of Kiel, Germany; **Co-Author:**Olaf Koeller, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Friederike Zimmermann, University of Kiel, Germany

Prior research gives evidence to suggest that dissocial behavior and prosocial behavior are related to school achievement. Little is known, however, about the incremental contribution of social behavior to school achievement over and above known predictors and for different measures of achievement such as school grades or standardized tests. Therefore, the purpose of this study was to examine whether adolescent student's dissocial and prosocial behavior influences school achievement as assessed by school grades and standardized achievement tests in mathematics and German while controlling for prior achievement, intelligence, and motivational variables. Altogether four subsamples of 7th and 9th graders with a total *N* of 4410 were investigated. Structural equation modeling consistently revealed in all subsamples that dissocial behavior and prosocial behavior incrementally contributed to school grades in mathematics and German over and above the known predictors. Effects of social behavior on test scores in German occurred only in one subsample of 7th graders, whereas test scores in mathematics were consistently related to dissocial behavior in all four subsamples. Overall, the results strongly support the relevance of investigations into the relationships between dissocial and prosocial behavior and school achievement.

Interpersonal adaptation in teacher-student interaction

Keywords: Educational Psychology, Quantitative methods, Social interaction, Video analysis

Presenting Author:Heleen Pennings, Utrecht University, Netherlands; **Co-Author:**Mieke Brekelmans, Utrecht University, Netherlands; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands

We investigated how teachers' and students' interpersonal behaviour patterns unfold and adapt to each other over time, during the lesson start. Using a continuous coding approach, observers rated moment-to-moment levels of Agency and Communion in teacher and student behaviour during the first 10 minutes of a lesson in 35 classrooms. Based on the resulting time-series data we derived several indicators of interpersonal adaptation (e.g., entrainment of linear trends, synchronicity of rhythmic qualities). We examined to what degree the principle of interpersonal complementarity of interaction between people (sameness for Communion, oppositeness for Agency) applies to teacher-student interaction and how the specific professional role and status of the teacher would affect this. Our expectations of interpersonal adaptation were basically confirmed in the present study. In most of the 35 classrooms, teacher and student behaviour during the lesson start was consistent with the overall principle of interpersonal complementarity. The results were also in line with expectations about violations of the general principle, given the professional role of the teacher (e.g., refrainment from hostility). Our exploration of the relation between momentary interpersonal dynamics and long-term teacher interpersonal style supported our conjecture that attention to micro-processes in classrooms (e.g., pattern of variability, anticipation of behaviour) adds to outcome-oriented, macro-level investigations of teacher-student interaction.

The Link Between Teacher Self-Efficacy and Student Achievement Depends on Teachers' Perspective

Keywords: Achievement, Educational Psychology, Self-efficacy, Teaching / instruction

Presenting Author:Marjolein Zee, University of Amsterdam, Netherlands; **Co-Author:**Peter de Jong, University of Amsterdam, Netherlands; **Co-Author:**Helma M. Y. Koomen, University of Amsterdam, Netherlands

The present study sought to explore the extent to which students' reading and math achievement are predicted by teachers' self-efficacy toward individual students (i.e., student-specific TSE) and toward the classroom (i.e., both general and aggregated student-specific TSE). General and student-specific TSE scales and standardized achievement tests were administered among a sample of 360 fourth-to-sixth grade students and 49 teachers from 19 regular elementary schools across the Netherlands. Multilevel structural equation modeling was used to test for direct relationships. Results indicated that neither students' reading achievement, nor their mathematics performance was predicted by their teachers' general TSE, after accounting for students' background characteristics. These findings held regardless of whether the general or aggregated TSE measure was used. In contrast, moderate positive associations were noted between student-specific TSE and both measures of academic achievement. The results of this study seem to support the assumption that the association of teachers' self-efficacy with students' reading and math achievement depends on teachers' perspective.

Effects of Meaning-Focused Instruction on Reading Comprehension in Grade 1 in Estonia and Finland

Keywords: Literacy, Primary education, Reading comprehension, Teaching / instruction

Presenting Author:Jenni Ruotsalainen, University of Jyväskylä, Finland; **Co-Author:**Piret Soodla, Tallinn University, Estonia; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

Children differ in their pre-skills in literacy reading which sets a challenge for reading instruction at school entry. Practices in early primary years' literacy instruction can be divided into code-focused and meaning-focused activities (e.g. Connor et al., 2009) which need to be balanced to match children's reading skill development. In the present study audiotapes from grade 1 literacy lessons in Estonia and Finland were coded with respect to amount of meaning-focused (MF) instruction during the lessons. The aim was to examine the effects of the amount of MF instruction on children's reading comprehension when children's concurrent reading fluency (RF) was taken into account. In Estonia children differed in their reading comprehension based on their reading fluency. In Finland the least fluent readers had the lowest reading comprehension scores whereas the average readers had similar reading comprehension results as the most fluent readers. Reading comprehension scores were especially poor among Finnish children in the low-RF group who attended high-MF lessons, and they benefitted most if they attended average-MF lessons. Increases in MF instruction had a positive effect on children's reading comprehension among Finnish children who belonged to the average- or high-RF group. No similar effects were found for the Estonian children. The findings suggest that average rather than high amount of meaning-focused instruction contributes to better reading comprehension skills among children in Grade 1.

Utilizing Three Different Lenses to Study Teaching Quality: Do They Lead to Similar Conclusions?

Keywords: Mathematics, Primary education, Teacher Effectiveness, Teacher Professional Development

Presenting Author:Evridiki Kasapi, University of Cyprus, Cyprus; **Presenting Author:**Marina Kenti, University of Cyprus, Cyprus; **Presenting Author:**Kassandra Georgiou Foivou, University of Cyprus, Cyprus; **Co-Author:**Charalambos Charalambous, University of Cyprus, Cyprus

A plethora of research findings during the last four decades attests to the critical role that teachers have for student learning. Not coincidentally then, recent years have seen a rapidly growing number of observation frameworks and instruments, aiming to capture teaching quality and connect it to what students gain from instruction. Despite the systematic scholarly work in this area, it seems that scholars have often worked in silos, focusing on certain instructional aspects and leaving others out—thus, often producing partial delineations of teaching quality. To address this gap, in this study we simultaneously use three different frameworks and observation instruments: one tapping into generic teaching aspects, a second capturing content-specific teaching aspects in Mathematics—the subject matter of interest—and a third one focusing on cognitive demands and exploring the unfolding of tasks in teachers' lessons. Utilizing these three frameworks and instruments as lenses, we analyzed 15 videotaped lessons, given by a convenience sample of five elementary school

teachers (each giving three lessons). Each lesson was analyzed by two independent coders leading to three classifications of the teachers, one for each lens under consideration. By comparing and contrasting these classifications, we noted both notable convergences and divergences of the teaching quality in each teacher's lessons. This, in turn, suggested that the use of only one instrument could lead to a fragmented picture of teaching quality. In discussing our findings, we consider their implications for teacher summative and formative evaluation purposes.

Dealing with mistakes in class – (Interactive) effects on students' achievement and motivation

Keywords: Misconceptions, Secondary data analysis, Student learning, Teaching / instruction

Presenting Author: Julia Käfer, German Institute for International Educational Research, Germany; **Co-Author:** Susanne Kuger, The German Institute for International Educational Research (DIPF), Germany; **Co-Author:** Eckhard Klieme, German Institute for International Educational Research (DIPF), Germany; **Co-Author:** Mareike Kunter, Goethe-Universität Frankfurt, Germany

Making mistakes is a regular phenomenon in everyday classroom settings. Still, there is only little research about how teachers and students deal with mistakes and the consequences for students' cognitive and motivational development. According to social-constructivist learning theories, a supportive way of dealing with students' mistakes enhances learning processes by providing information about misconceptions and giving students the opportunity to learn from (their) mistakes (Hesketh, 1997; Vosniadou & Brewer, 1987). This study analyses how teachers' and students' attitudes and reactions towards mistakes affect two most relevant outcomes of education: student learning and motivation. A second aim is to explore whether the heterogeneity of the student body in the classroom a) influences the teachers and students dealing with mistakes and b) moderates the effects of dealing with mistakes on students' achievement and motivation. The study uses data from the representative German DESI study (DESI-Konsortium, 2008) that assessed student development in English as a foreign language with 4,688 ninth grade students in 426 classrooms in German secondary schools. Doubly latent multilevel structural equation modelling (ML-SEM) reveals that different aspects of students' and teachers' attitudes and reactions towards mistakes in class predict student achievement and motivation in English as a foreign language. Unexpectedly, first results show no interaction effects between the heterogeneity of students and different aspects of dealing with mistakes. These results are particularly important in light of the instructional effectiveness research and provide further empirical evidence on the topic of heterogeneity in classrooms.

Effectiveness of Feedback in a Repeated Spelling Training

Keywords: Instructional design, Learning and developmental difficulties, Primary education, Writing / Literacy

Presenting Author: Sophie Gruhn, Radboud University Nijmegen, Netherlands; **Co-Author:** Eliane Segers, Radboud University Nijmegen / University of Twente, Netherlands; **Co-Author:** Ludo Verhoeven, Radboud University Nijmegen, Netherlands

Effectiveness of feedback on strengthening lexical representations was investigated in a computerized spelling training by contrasting two different feedback conditions with a no feedback condition. Ninety-one Dutch fifth and sixth graders practiced spelling of 40 multisyllabic words with irregular grapheme-phoneme correspondence in five training sessions within maximally two weeks. In the two feedback conditions, participants were asked to write the word again, after they have received the correct word form. In the first condition *visual dictation* ($N = 29$), their next spelling attempt was required from memory, whereas participants in the second condition *typing over* ($N = 30$) were asked to copy the word. A control group ($N = 31$) did only receive information about the correctness of their writing attempt. With repeated measures ANOVA's, higher gains in spelling accuracy over time were observed for participants in both feedback conditions compared to participants in the no feedback condition. Already after one training session, feedback in form of visual dictation led to higher gains in spelling accuracy than feedback in form of typing over. Participants in the typing over condition caught up with the visual dictation condition only at the fourth training session. The repeated spelling training generally improved spelling speed of trained words. Transfer to spelling speed and accuracy of untrained words and transfer to reading speed of words trained and not trained in spelling was observed. Repeated spelling can be a relevant method to improve decoding skills and feedback seems to increase the efficiency of spelling instruction.

Symposium

Teaching and Teacher Education

Analyzing teachers' pedagogical content knowledge in economic and business education

Keywords: Competencies, Mixed-method research, Pre-service teacher education, Teacher Professional Development, Vocational education

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Juergen Seifried, University of Mannheim, Germany

Discussant: Fien Depaepe, KU LEUVEN, Belgium

Designing and implementing instruction is considered to be the "core business" of teachers and should be the main focus of research on teachers' professional competencies (Baumert et al., 2013, 3). Empirical evidence shows that teachers'

pedagogical content knowledge (PCK) significantly influences student learning (e.g. Ball, Hill & Bass, 2005; Baumert & Kunter, 2013). Despite the growing number of studies on (prospective) teachers' PCK, evidence for teachers in business and economics remains scarce. The symposium combines four papers that analyze PCK of prospective and experienced teachers in business and economic education. Each of the presented studies were implemented in the German-speaking parts of Europe (Germany, Switzerland and Austria), where vocational education and training is of great importance. These three countries provide specific study programs for teachers at vocational schools (e.g. economics and business education). The contributions provide insights into different facets of PCK. In essence, the papers cover (1) teachers' lesson planning activities, (2) explaining skills, (3) handling of students' errors and (4) cognitive activation. While the first two contributions focus on teacher training at university level, paper three and four deal with experienced teachers' PCK. Hence, the symposium provides information on the level of PCK of prospective and experienced business and economic teachers in German speaking countries and links teachers' PCK to various opportunities to learn (OTL). The symposium therefore aims (1) to contribute to closing the research gap concerning this particular domain and (2) to build upon existing findings on the influence of teacher education on PCK.

Development of lesson planning competency of prospective business teachers

Presenting Author: Elisabeth Riebenbauer, University of Graz, Austria; **Co-Author:** Michaela Stock, University of Graz, Austria

The repertoire of a teacher's methodological, content specific and pedagogical content knowledge and skills is expressed in planning and teaching activities. Designing lessons is a core task of teachers and plays a central role in teacher education programs. Empirical findings show that the approach and the quality of the planned lessons are influenced by teaching experience (for business teachers see e.g. Sageder, 1992; Seifried, 2009). While expert teachers are able to predict learners' problems and misconceptions more precisely, "novices' propositional structures for pedagogical content knowledge seem particularly limited" (Borko & Livingston, 1989, 490–491). As a result, novice teachers face problems to decide what kind of learning opportunities their students need and how to determine the method of instruction which will lead to the greatest cognitive activation. However little is known about how planning competencies are developed during the professionalization process and to what extent teacher education enhances lesson planning. Therefore a longitudinal study is conducted to learn more about teaching and learning processes of prospective business teachers (N = 186). The presentation shows results of selected aspects of pedagogical content knowledge (PCK) based on planning activities for accounting lessons of business education master students in Austria.

Prospective teachers' ability to design and provide instructional explanations

Presenting Author: Juergen Seifried, University of Mannheim, Germany; **Co-Author:** Stefanie Findeisen, University of Mannheim, Germany

Teacher education programs at universities play a key role in the development of (prospective) teachers' knowledge. This study examines one central facet of prospective business teachers' pedagogical content knowledge: the knowledge of and the ability to explain subject-matter to students. By combining data from a quantitative test instrument (paper-pencil-test; N = 1,152 teacher candidates) and a qualitative video study using an interactive simulation (N = 48 teacher candidates), we are able to offer multi-perspective insights into prospective teachers' knowledge base and abilities. We find significant correlations between prospective teachers' ability to explain business contents and their content knowledge (CK). Moreover, the results show that prospective teachers struggle with the task of adequately explaining subject-matter. They specifically experience difficulties when it comes to providing examples or graphical representations and their explanations often contain errors. Furthermore, university-based opportunities to learn (OTL) seem to have little effect on prospective teachers' ability to provide explanations. Implications for teacher education programs in business education are discussed.

Teachers' ability to handle students' errors – results from video analyses in accounting classes

Presenting Author: Patricia Köpfer, Goethe-Universität Frankfurt, Germany; **Co-Author:** Eveline Wuttke, Goethe-Universität Frankfurt, Germany; **Co-Author:** Juergen Seifried, University of Mannheim, Germany

Students' errors in the classroom are assumed to contain a high learning potential. However, to enable students to learn from their errors, they need support. Teachers have to be able to diagnose an error and give helpful feedback (*professional error competency*, PEC). Teachers' competency to adequately deal with errors is gaining increasing importance in research on teacher competency. Since errors and therefore PEC are domain-specific, empirical research for different domains is needed. In our field of interest—teacher training in business and economic education—empirical evidence is scarce. We contribute to filling this gap by focussing on PEC in accounting education. In the present study we address two facets of PEC and examine the learning potential of students' errors from teacher and learner perspectives. In order to do this, we videotaped classroom interaction in error situations in commercial vocational schools. In the present proposal, we report first results regarding the theoretical learning potential of students' errors. In further research, we will combine these findings with the results from student knowledge tests and the learners' point of view using interview data. Results will be presented at the conference.

Swiss commercial VET teachers' pedagogical content knowledge

Presenting Author: Doreen Holtsch, University of Zurich, Switzerland; **Co-Author:** Johannes Hartig, German Institute for International Educational Research (DIPF), Germany

Although teachers' pedagogical content knowledge (PCK) is considered crucial for instructional quality and students'

development, little is known about Swiss commercial VET teachers' PCK. In this respect, we were particularly interested in differences in PCK between *Economics and Society* (E&S) teachers with an academically oriented teacher training and those with a more practically oriented training. In order to model and measure teachers' PCK we developed a test covering the facets of 'explaining', 'student (mis-)conceptions' and 'cognitive activation'. During test development, we collected validity evidence from both criterion situations and cognitive interviews. A total of 157 teachers participated in the PCK test which consisted of open-ended and closed-ended items. An analysis of teachers' responses with the aid of a confirmatory factor analysis showed that PCK is a rather multifarious construct. However, there was no difference between the PCK of teachers having followed the academically oriented pathway and those having followed the practically oriented pathway.

Symposium

Teaching and Teacher Education

Teachers' epistemic cognition for professional practice: a focus on reflection and reflexivity

Keywords: Attitudes and beliefs, Pre-service teacher education, Reflection, Social aspects of learning and teaching, Teacher Professional Development, Teaching / instruction

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Jo Lunn Brownlee, Queensland University of Technology, Australia

Discussant: Clark Chinn, Rutgers University, United States

Both reflection and reflexivity are important topics in the teacher belief change literature, particularly with regard to teachers' epistemic beliefs. Collectively, the fields of reflection and epistemic cognition require additional theoretical work to identify plausible conceptual frameworks and resolve measurement issues to explore change in epistemic cognition and to address how reflection and epistemic cognition affects teaching practices. The symposium will present scholarly outcomes from a four-day Advanced Study Colloquium (ASC) with 13 international scholars (from 6 countries) hosted by the European Association for Research in Learning and Instruction (EARLI) in 2015. The ASC included 13 international scholars from six countries with expertise in teachers' epistemic cognition and reflection/reflexivity. The ASC met to explore epistemic cognition for teaching and teacher education through an innovative focus on epistemic reflexivity. The papers in this symposium collectively explore international perspectives of teachers' reflexivity and epistemic cognition to (a) summarize the contributions of the literature, (b) identify directions for new theory and research, and (c) discuss ways that teacher's epistemic cognition and practices can be changed through a focus on epistemic reflexivity. The papers make a vibrant knowledge contribution, which will lead to knowledge translation that could promote change in teachers' epistemic cognition. With this symposium, it is also our intent to voice a compelling argument in the field of teaching and teacher education to recognize the relevance of epistemic cognition as a critical issue for teacher education and classroom education.

Changing teachers' epistemic cognition: A new framework for epistemic reflexivity

Presenting Author: Jo Lunn Brownlee, Queensland University of Technology, Australia; **Presenting Author:** Leila Eve Ferguson, University of Oslo / Kristiania University College, Norway; **Presenting Author:** Mary Ryan, Macquarie University, Australia

There is increasing evidence to show that teachers' epistemic cognition is related to how they conceive of and engage in teaching so it is important that teachers develop adaptive epistemic cognition. This presentation provides an overview of the different ways of theorizing and investigating changes in epistemic cognition in the context of teaching and learning. A growing body of research shows that explicit reflection on epistemic cognition may be a useful way to promote change. Drawing on the work of Lunn and colleagues, and the Advanced Study Colloquium (ASC) group funded by EARLI in 2015, we extend explicit reflection to encompass reflexive thinking. Reflexivity involves critical thinking that evaluates multiple perspectives in context and leads to specific action in the classroom. The 3R-EC Framework for theorising change in epistemic cognition is described and exemplified in the contexts of classroom practice and teachers' professional learning.

Informed reflexivity: Enacting epistemic virtue

Presenting Author: Mary Ryan, Macquarie University, Australia; **Co-Author:** Rainer Bromme, University of Münster, Germany; **Co-Author:** Florian Feucht, The University of Toledo, Germany; **Co-Author:** Dorothe Kienhues, University of Münster, Germany; **Co-Author:** Michael Weinstock, Ben-Gurion University of the Negev, Israel

In this paper we explore the usefulness of 'reflexivity' as a concept for describing and understanding the epistemic virtue of educational endeavors. 'Reflexivity' is sometimes implicitly, often explicitly a goal in the designing of learning environments and of curricula, for students as well as for teachers, in formal as well as informal learning settings. Reflexive thinking is the type of reasoning that the promotion of epistemic cognition should produce among students across domains. The paper will present analyses of how reflexive thinking appears in four domains with particular reference to educational efforts in these domains. The domains represent academic disciplines (science and history) and activities that cross disciplines (writing and critical thinking). Casting reflexive thinking as consideration of possible domain practices and their meaning in relation to domain-appropriate epistemic aims and reliable process is consistent with viewing epistemic

cognition as a process and sensitive toward domain. However, also finding reflexive thinking as an epistemic virtue across domains suggests the value of a teacher education focus on reflexivity. Student teachers should learn to develop their teaching through the steps of the reflexivity cycle with specific attention to their practices around epistemic cognition. They should also learn to foster reflexivity in their students. Following the analyses of the domains, the paper will consider how interventions might look in teacher education that both encourage teachers to engage in reflexivity and have them foster reflexive thinking as an epistemic virtue within each domain.

The social epistemology and reflexivity of teachers' learning groups

Presenting Author:Michael Weinstock, Ben-Gurion University of the Negev, Israel; **Co-Author:**Adam Lefstein, Ben-Gurion University of the Negev, Israel; **Co-Author:**Itay Pollak, Ben-Gurion University of the Negev, Israel

Much of what teachers learn about teaching takes place in their solitary practice of in the classroom. In classrooms, they gain experiential knowledge about teaching. In the current research, our interest is in how experiential knowledge, along with formal knowledge about teaching, is considered and expressed in organized groups of teachers talking about to improve their teaching. While how teachers justify and evaluate sources of knowledge involve individual epistemic cognition, our emphasis is on social epistemology. Social epistemology concerns (1) social evidence, (2) the epistemic quality of groups' beliefs and knowledge, and (3) epistemic implications of given institutional practices particularly in comparison with alternative practices. We look at teacher dialogues to assess how they use and offer testimony regarding teaching practices (social evidence), raise epistemic aims and use reliable processes for evaluating and justifying claims (epistemic quality of the group), and evince the formal knowledge and institutional aims that might inform practices and knowledge (epistemic implications of institutional practices). Analyses of teaching dialogues look at these characteristics and the reflexive practices of the group in identifying aims of practices, considering practices against alternatives, and deciding on courses of action based on reliable processes of knowing.

Professional Development in Dialogic Teaching: The Role of Epistemic Cognition

Presenting Author:Alina Reznitskaya, Montclair State University, United States; **Co-Author:**Ivar Bratton, University of Oslo, Norway; **Co-Author:**Krista Muis, McGill University, Canada

In this theoretical paper, we suggest that teachers' epistemic cognition, in particular their thinking about epistemic aims and reliable processes for achieving those aims, may enhance or restrict opportunities for students to acquire deep understanding of complex, controversial issues. This is because teachers' epistemic cognition may impact how well teachers learn to use dialogic practices that engage students in reasoned argumentation about such issues. Following 3R model of reflexivity (Brownlee, Schraw, Walker, & Ryan, 2016), we also argue that teachers need to reflect on their own epistemic cognition in the context of dialogic practice in order to calibrate it with the aim of deep understanding and the reliable process of reasoned argumentation. We discuss relevant scholarship on epistemic cognition, dialogic teaching, and professional development, to identify promising directions for future work in this area.

Symposium

The relevance of prior knowledge for knowledge acquisition in STEM

Keywords: Achievement, Educational Psychology, Higher education, Knowledge creation, Mathematics, Meta-analysis, Science education

Interest group:

Chairperson: Bianca Simonsmeier, University of Trier, Germany

Discussant: Jeroen Van Merriënboer, Maastricht University, Netherlands

Prior knowledge is a key variable for learning and achievement in school. However, despite the increasing amount of studies on prior knowledge and learning, insights into the detailed mechanisms and knowledge pathways are still limited. This symposium aims to provide insights on both. It includes three empirical studies and one meta-analysis focusing on the influence of prior knowledge on later learning. Two studies investigate the relation between prior knowledge and later academic achievement in mathematics and sciences. The other study is a controlled intervention study investigating whether early physics education (i.e. increasing prior knowledge) positively influences later learning. The meta-analysis integrates results from a wide range of studies, investigating the overall effect of prior knowledge on later knowledge and learning. The studies provide data for a variety of educational settings, ranging from preschool to university. Overall, the studies paint a detailed picture of the influence of prior knowledge on learning and its role in the broader context of academic achievement in science. The discussion will identify common themes, integrate the findings, and reflect on challenges for future research and practical educational settings. Especially characteristics of knowledge (i.e. quality and quantity) as well as teaching and instruction will be highlighted.

E-assessment as a tool for activating prior knowledge and supporting learning

Presenting Author:Henna Asikainen, University of Helsinki, Finland; **Co-Author:**Viivi Virtanen, University of Helsinki, Finland; **Co-Author:**Jaana Blomster, University of Helsinki, Finland

This study concerns the purpose, practices, and experiences of using online pre-exam in introductory class of Biosciences in B.Sc. studies at university. The aim of the study is to evaluate how the achievement in the electronical prior-knowledge test relates to the achievement on the course. In addition, this study aims to examine how the prior knowledge and the feedback given by the e-assessment tool helps the students in their studies on the course, and how do students experience the help they get. 170 students participating in a large introductory bioscience class participated in this study comprising 52 students who did the pre-exam. Students' scores on the pre-exam, midtest and final exam, as well as their experiences of the pre-exam, were included in the analyses. The analyses were conducted both by using statistic and qualitative methods. Preliminary results show that students who took the pre-exam before the course were more successful in the midtest, which suggests that the pre-exam helped the students in their learning.

Patterning Knowledge is Foundational to Mathematics Achievement

Presenting Author:Bethany Rittle-Johnson, Vanderbilt University, United States; **Co-Author:**Emily Fyfe, Indiana University, United States; **Co-Author:**Erica Zippert, Vanderbilt University, United States

Children's prior knowledge influences their future mathematics learning. For example, prior knowledge of math measured before formal schooling is predictive of later mathematics achievement over and above many other factors. Thus, the *amount* of prior math knowledge matters. However, we know much less about how particular *types* of prior mathematics knowledge influence later math learning. We focus on one understudied, yet potentially critical type of prior math knowledge: *patterning knowledge* (identifying and extending predictable sequences in objects or numbers). In the first study, we verified that patterning knowledge was uniquely and concurrently associated with early math achievement. We assessed 74 children's patterning knowledge, mathematics achievement, and other cognitive skills before entry into formal schooling (ages 4-5). Patterning knowledge was a unique predictor of math achievement over and above spatial skills, working memory, and verbal IQ. In the second study, we focused on *prior* patterning knowledge and later mathematics achievement. We assessed 513 children's patterning and numeracy knowledge before formal schooling (age 5) and after two years of schooling (age 7). We then measured their formal math achievement after seven years of schooling (age 12). Patterning knowledge at both earlier time points was a unique predictor of mathematics achievement at age 12, over and above numeracy knowledge and a variety of cognitive and behavioral characteristics. These studies provide strong evidence for the importance of patterning knowledge for mathematics achievement. We conclude with potential ways that patterning knowledge may support math learning.

Prior Knowledge from Elementary School Curricula on Physics Prepares for Future Learning

Presenting Author:Ralph Schumacher, ETH Zurich, Switzerland; **Co-Author:**Brigitte Hänggi-Surer, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; **Co-Author:**Lennart Schalk, ETH Zurich, Switzerland; **Co-Author:**Elsbeth Stern, ETH Zurich, Switzerland

The acquisition of appropriate conceptual knowledge in physics is often impeded by inappropriate prior knowledge constructed on everyday experience. For example, believing that a ship made of iron floats because the air in the ship's body pulls it upwards is incompatible with the concept of buoyancy force. In a controlled intervention study, we investigated whether early physics curricula implemented in 3rd and 4th grade will prepare students for learning from a more advanced curriculum on hydrostatic pressure in water. Importantly, the hydrostatic pressure in water curriculum was designed as a stand-alone curriculum that did not directly reference the earlier curricula. We prepared 153 children with the early physics curricula for the hydrostatic pressure curriculum, while 173 children did not receive this preparation. Both groups strongly improved their understanding of hydrostatic pressure in water as a consequence of teaching, but children who received the preparatory physics curricula achieved even higher learning gains. Thus, our study revealed indirect effects of appropriate prior knowledge for subsequent learning. Supporting students already in elementary school in substituting inappropriate by appropriate explanations prepares them to better benefit from future physics education.

The Influence of Prior Knowledge on Learning and Transfer: A Meta-Analysis

Presenting Author:Bianca Simonsmeier, University of Trier, Germany; **Co-Author:**Maja Flaig, University of Trier, Germany; **Co-Author:**Lennart Schalk, ETH Zurich, Switzerland; **Co-Author:**Anne Deiglmayr, ETH Zurich, Switzerland; **Co-Author:**Michael Schneider, University of Trier, Germany

Many studies have investigated the association between prior knowledge and later learning. Most associations were positive but varied considerably in their strengths. Even though a positive relationship between prior knowledge and later learning is assumed, no systematic overview has investigated this assumption yet. Furthermore, it remains unclear whether and to what extent the strength of these associations differs systematically over different domains and types of knowledge, and what other factors such as educational level or method of instruction may moderate the association. We investigated these questions by means of a meta-analysis. The literature search yielded 197 articles reporting 3574 effect sizes found with 54439 participants. Effect sizes were combined by means of random effects model using the robust variance estimation method. The overall effect was $r^+ = .51$ (CI [.478, .546]). We furthermore found significant moderators for the prior knowledge-later knowledge relationship in methodological, contextual, instructional, learner related, knowledge related, and transfer related variables. The results demonstrate the importance and complexity of the effect of prior knowledge on later learning dependent on the characteristic of specific domains and subjects, contextual influences of the learning environment, and individual differences of the learner.

Session F 10

Symposium

Higher Education, Lifelong Learning

What do we know about post-PhD experience?

Keywords: Comparative studies, Doctoral education, Educational policy, Higher education, Lifelong learning, Mixed-method research, Qualitative methods, Researcher education, Workplace learning, Writing / Literacy

Interest group: SIG 24 - Researcher Education and Careers

Chairperson: Montserrat Castelló, Ramon Llull University, Spain

Discussant: David Boud, Australia

Post-PhD researchers in universities are generally seen as a highly accomplished group of early career researchers (ECRs) who contribute to national productivity and global competitiveness. We characterize these individuals as researchers who are not yet fully independent, in the second stage of their development as researchers (R2) using the European Commission European Framework for Research Careers. While over the past twenty years, there has been a growing international focus on research on doctoral education, the education of post-PhD researchers has been largely invisible and under examined. This symposium is designed to stimulate discussion on what do we know about post PhD experience and on theoretical and methodological challenges underlying this research, in order to track different researcher identity development paths and reflect on the type of developmental support they require. Different contributions reflect emergent studies emphasizing innovative and complementary methodological perspectives (mixed-methods, longitudinal, multimodal), developed in diverse geographical and cultural contexts. Through these perspectives and contexts, we intend dialogue to be stimulated in the symposium and in the future, we hope the development of international comparative research studies that lead us to gain a concrete understanding of the effects of global developments for researcher education and careers.

How do the career intentions of PhDs and post-PhDs reflect personal lives and career opportunities?

Presenting Author: Lynn McAlpine, University of Oxford, United Kingdom; **Co-Author:** Cheryl Amundsen, Simon Fraser University, Canada

Little is known about the career intentions of PhDs and post-PhDs, for instance, the extent to which individuals vary in the stability of their intentions over time, and what influences lead to changes in individuals' intentions. This paper addresses how individual career intentions are reflective of personal values, goals and responsibilities as well as career opportunity structures. The research uses an identity development perspective situated in a narrative approach to inquiry. It draws on data from our 10-year longitudinal qualitative research design in which 48 individuals were followed as they transitioned into a range of post-PhD careers. On an annual basis, we collected biographical information, weekly activity logs, a pre-interview questionnaire, and an interview. This cycle was repeated from 4 to 6 times with a final follow-up the year afterwards. The subsequent analysis showed six ways in which individuals' personal lives played a role in their career decision-making: a) life goals; b) personal values; c) work-life balance; d) (lack of) well-being; e) family responsibilities and priorities; and f) financial duress and insecurity. These personal themes interacted with perceived career opportunities in career decision-making related to careers in the academic, public, para-public and private sectors. The results begin to provide a much needed fuller explanation for distinct (different from other individuals) but real (evolving circumstances) career decision-making.

Reading the Map of Post-PhD Academic Networks

Presenting Author: Isabelle Skakni, University of Oxford / Université Laval, Canada; **Co-Author:** María del Carmen Calatrava Moreno, Technische Universität Wien, Austria; **Co-Author:** Mariona Corcelles, Universitat Ramon Llull, Spain; **Co-Author:** Lynn McAlpine, University of Oxford, United Kingdom

It is widely acknowledged that a fundamental aspect for the advancement of post-PhD careers is the development of own academic networks as well as research collaborations. Now, what are the actual academic relationships that post-PhD researchers are establishing in their trajectory? And what is the actual role of such relationships in their career? This study approaches these questions not only by analysing survey and interview data, but also by examining network plots that post-PhD researchers in the UK were asked to create in order to represent and explain their scientific networks. A total of 64 individuals completed the survey and 11 of them—from diverse fields and different stages of their post-PhD—agreed to be interviewed. In analysing these data six kinds of post-PhD relationships emerged. These relationships were mainly national and not extensive, with relatively few individuals and research groups other than their own colleagues and institutions. We examined their impact on the work and career of post-PhD researchers, and often found networks that offer limited opportunities for intellectual support and collaboration. Lastly, we analysed the influence of past experiences on the development of their networks. We observed that relationships between individuals are more likely to be maintained than relationships with research groups or institutions. However, a pattern of network growth in more experienced post-PhD researchers was not observed. This comprehensive view of post-PhD relationships, together with the understanding of their influence constitute a valuable contribution for the implementation of policies directed at supporting post-PhD career

progression.

Interest and function of social support among UK and Spanish post PhD researchers

Presenting Author:Kirsi Pyhältö, University of Oulu / University of Helsinki, Finland; **Co-Author:**Jouni Peltonen, University of Oulu, Finland; **Co-Author:**Montserrat Castelló, Ramon Llull University, Spain; **Co-Author:**Lynn McAlpine, University of Oxford, United Kingdom

Life after PhD is challenging. Post PhD researcher's motivation is a central determinant in remaining resilient in facing the challenges post PhD researcher's motivation. Yet we know surprisingly little on what motivates post-doctoral researchers, and variation in their interest across the individuals and different cultural contexts. This study explores the cross-cultural variation in post PhD. researchers' research interest by comparing UK and Spanish post PhD researchers' interest and to explored individual variation between the post PhD researchers' interest. Altogether, 282 Post PhD researchers in social sciences and sciences from research intensive universities the UK (n=98) and Spain (n=184) participated to the study. The data were collected with *Post PhD experience* – survey. Results showed that Spanish post PhD degree holders entertained higher levels of *research* and *professional interest* than UK ones. Two distinctive interest profiles were detected: *High Interest*- profile (67%) presenting the dominant profile, and the *Low Interest* –profile (33%). Those researchers employing *High Interest* -profiles reported higher levels of supervisory and researcher community support than their counter partners with *Low Interest* – profile. The results suggested that significant variation not only across the countries but also between the post PhD researchers occurred in terms of their interest, and that the interest profiles were associated with supervisory and researcher community support.

Post-PhD researchers' writer identity development: Relationship between conceptions and experiences

Presenting Author:Montserrat Castelló, Ramon Llull University, Spain; **Co-Author:**Anna Sala-Bubaré, Ramon Llull University, Spain; **Co-Author:**Nuria Sune-Soler, Ramon Llull University, Spain; **Co-Author:**Marta Pardo Estruch, Ramon Llull University, Spain

Post-PhD researchers are expected to contribute to a country's productivity and competitiveness mostly through writing, which represents a privileged means to become an independent researcher. However, little is known about how Post-PhD researchers experience writing and how, when and why these experiences influence or modify their previous writing conceptions and, ultimately, the development of their writer identity as researcher. We used a mixed-method approach to investigate the relationship between Post-PhD researchers' writing conceptions and experiences. 189 Spanish Post-PhD researchers answered a questionnaire on writing conceptions and participated in retrospective multimodal interviews, in which Journey Plots were applied. Results from the questionnaire showed two post-PhD profiles regarding writing conceptions. Qualitative results from interviews indicated that these profiles mediated the development of writing identity and were related to the position that Post-PhD researchers have in the community, and to some specific writing experiences, such as participating in different kind of co-authorship practices, feeling competent in writing a variety of genres and having specific training opportunities.

Session F 11

Symposium

Learning and Instructional Technology, Lifelong Learning, Teaching and Teacher Education

Negative Knowledge at Work: Insights from Four Professions

Keywords: Cognitive development, Cognitive skills, Cooperative / collaborative learning, Higher education, In-service teacher education, Informal learning, Instructional design, Learning Technologies, Lifelong learning, Qualitative methods, Reflection, Teacher Professional Development, Teaching approaches, Vocational education, Workplace learning

Interest group: SIG 07 - Learning and Instruction with Computers, SIG 11 - Teaching and Teacher Education, SIG 14 - Learning and Professional Development

Chairperson: Martin Gartmeier, Germany

Discussant: Jaana Parviainen, University of Tampere, Finland

One plausible consequence of experiencing and learning from errors is knowledge about erroneous assumptions, about wrongful courses of action and about limitations of own skills or insight. Such knowledge has been labeled *negative knowledge* (NK) (Gartmeier, Bauer, Gruber & Heid, 2008; Minsky, 1997; Oser & Spychiger, 2005) in discourses on informal, workplace based learning and the development of professional expertise. From a pragmatic point of view, NK is a useful cognitive resource e.g. in order to not repeat errors which have been made earlier. Moreover, from a more holistic perspective, the theory of NK also relates to modern notions of professional competence which assume that competence development is not merely a cumulative, linear process. Instead, it also involves the capability to master paradigmatic changes which make existing knowledge obsolete and require abandoning established routines (Parviainen & Eriksson, 2006). The present symposium seeks to address and bring together both perspectives: The first question in focus is how professionals from different fields of work develop and/or use negative knowledge in their practice. Empirical studies from culinary and teacher education, from medicine and from educational counseling will investigate this question from different domain-specific angles. The fifth, discursive contribution will adopt the second perspective foreshadowed above: In drawing

upon the evidence at hand, the question will be raised in which ways the concept of NK allows to investigate aspects of professional competence which otherwise remain unrecognized.

Developing negative knowledge in contexts of time-competitive culinary training

Presenting Author:Charlotte Jonasson, Aarhus University, Denmark

Aims. This study explores how students' development of negative knowledge is influenced by their competition to deliver timely cooked meals in a Danish culinary school. The instructional potentials for developing student learning through constructive competition are investigated. **Methodology.** A one year fieldwork was conducted at a Danish vocational school for culinary students. Main methods were participant observations of school-based vocational training and semi-structured interviews (N=83). **Findings.** The empirical examples show that the instructional intentions of resembling the timely delivery of courses in the culinary vocations led to enhanced competition and opportunities of developing procedural and self-reflective negative knowledge. This was conditioned by the students' attention to more constructive competition of enhancing persons' ambitions through collaboration, help seeking and shared reflection on errors. Self-reflective negative knowledge was not developed in groups, where destructive competition striving for exclusive achievement outcomes and demonstration of self-sufficiency flourished. Other students engaged in collaborative practices developed timely procedural negative knowledge of 'knowing when not to fool around' through their competition to gain positive assessment of their work. **Significance.** Overall, self-reflective negative knowledge of own limitations and shared reflections on errors were important premises for student learning, which could easily be hindered by destructive competition, involving self-protective strategies and self-sufficiency. Yet, the time-competitive context also leveraged students' engagement, their attention to the task and development of procedural negative knowledge. In conclusion, there are opportunities for enhancing student learning through constructive competition, where students take the time to collaborate to develop own and others' knowledge and skills.

Effects of problem-solving procedures in error-based learning in the context of medical education

Presenting Author:Robin Stark, Saarland University, Germany; **Co-Author:**Martin Klein, Saarland University, Germany; **Co-Author:**Nicole Heitzmann, University Munich & Clinics of University Munich, Germany; **Co-Author:**Martin R. Fischer, University Hospital of LMU Munich, Germany

In medical practice, diagnostic errors often have dramatic consequences. Therefore, providing erroneous information to enhance learning seems counterintuitive. However, learning from errors can foster the acquisition of "negative knowledge" provides an important protection against erroneous decisions and procedures (Oser & Spychiger, 2005). In addition, the instructional use of errors can lead to a deeper understanding and can support the development of "illness scripts" (Boshuizen et al., 1995). In earlier studies, the diagnostic competence of medical students was enhanced by an error-based instructional approach implemented in a web-based learning environment with case-based examples (X1). In the present study, additional problem-solving procedures were integrated in a similar learning environment to support the effectiveness of the error-based approach. Students were either confronted with multiple-choice tasks or with reflection prompts during the learning process. Both problem-solving procedures did not pay off. In contrast to our hypotheses, the unsupported example condition was most effective with respect to fostering diagnostic competence. The effects of the learning conditions on diagnostic competence was *mediated* by cognitive load and *moderated* by the students' self-efficacy. Both problem-solving procedures increased extraneous cognitive load. For learners with low self-efficacy, the problem-solving procedures interfered with effective error-based learning. Our error-based instructional approach is an innovative measure to foster diagnostic competence in the context of medical education. However, with respect to additional instructional measures intended to support error-based learning processes, less seems to be more.

Negative Knowledge of Counselors: Relation to Professional Experience and Contextualization

Presenting Author:Martin Gartmeier, Technical University of Munich (TUM), Germany; **Co-Author:**Josef Strasser, University of Augsburg, Germany

This contribution investigates the significance of negative knowledge (NK) in the profession of educational counselling. NK has been defined as form of experiential knowledge and an outcome of learning from errors. It is conceptualized as knowledge about how something does not work, about what assumptions are untrue or about limitations of own knowledge or skills. The present study empirically investigates various forms of NK, their prevalence in different levels of professional experience and their embeddedness in different knowledge contexts and in episodic statements. Data were collected through using a structured interview technique with 31 educational counselors. Verbal protocols were content analyzed with very good reliability. Analyses revealed discriminative and self-reflective NK to be relevant for the respondents. Comparing differently tenured educational counselors revealed no significant differences. Large differences were found, however, regarding the various knowledge contexts investigated. Finally, about 20% of negative knowledge was embedded in episodes, whereby especially experts verbalized a significantly higher amount of episodically embedded NK.

The acquisition of negative knowledge during teacher education

Presenting Author:Tina Hascher, University of Bern, Switzerland; **Co-Author:**Christine Kaiser, University of Salzburg, Germany

Although learning processes of student teachers increasingly gain interest in research on learning and instruction, less is known about the factors that influence these learning processes and outcomes. The presented study is based on the assumption that student teachers' learning is, among other, triggered by mistakes they make during field experiences

(student teaching). Mistakes can be a source for developing what has been labelled negative knowledge, i.e. an individual's cognition about negative experiences, dysfunctional and maladaptive behaviour. Our presentation addresses the following questions:

- 1) What mistakes did student teachers experience?
- 2) How did student teachers realize their mistakes?

In order to answer these questions, we analysed student teachers' diaries ($n = 620$; Authors, 2015) by means of qualitative content analysis (Mayring, 2010; Cohen's Kappa of 40% of the reported mistake episodes between .70 and .83). Categories were: mistake types with regard to aspects of instructional quality, phases of instruction (planning instruction, teaching, reflection), and indicators of mistake. 55% of all episodes addressed mistake episodes, thereof 26.5% (most frequent category) a lack of student orientation. 21.9% of the mistake episodes were categorized as mistakes with regard to insufficient clarity and structure of instruction. Generally, mistakes were related mainly to planning instruction and teaching (49.3% of all mistake episodes each) with only very few episodes focusing the reflection on instruction. 46% of all episodes were attributed to learners' feedback or reaction as mistake indicators.

Symposium

Motivational, Social and Affective Processes

Interest, motivation and aspirations in STEM: How do these factors develop and influence each other?

Keywords: Attitudes and beliefs, Motivation, Physical Sciences, Science education, Secondary education, Social interaction

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Adam Maltese, Indiana University, United States

Discussant: Adam Maltese, Indiana University, United States

Participants from three countries and differing research and/or methodological traditions will use data from current projects to discuss their understanding of how young people's interest, motivation and career aspirations in STEM develop over time and in different contexts, and how these factors influence each other. Specifically, each participant will draw on his or her study when addressing the following questions: 1. - What research questions are you asking concerning motivation and interest and students' continued pursuit of STEM? 2. - Who are your study participants and in what learning setting is your study conducted? 3. - How have you conceptualized and measured interest and motivation? 4. - What do your findings contribute to understanding (a) why many students have an interest in STEM but do not see it as "for them"? (b) students' sense of self, their interest and motivation, and (c) the role of classroom practices and classroom/culture in relation to students' STEM interest and motivation? - What are needed next steps for this line of research?

The pressure is on: Understanding changes in science motivation and interest from age 10 to 16

Presenting Author: Julie Moote, University College London, United Kingdom; **Co-Author:** Louise Archer, King's College London, United Kingdom; **Co-Author:** Jennifer DeWitt, King's College London, United Kingdom

There are widespread national and international concerns that not enough young people are continuing with science post-16. As attitudes towards science have been found to be a strong predictor of performance outcomes and STEM participation post-16 (e.g. Hattie, 2009), these trends are worrying for science educators. Further, in a meta-analysis of studies looking into student interest and attitudes towards science, Awan and colleagues (2011) found that students in developed countries showed lower interest and less positive attitudes in science than students in developing countries. Therefore these issues are extremely relevant for the Western world. This paper presents findings from ASPIRES, a ten-year project aiming to understand the processes through which students develop their science and career aspirations between the ages of 10 and 19. Through comparing the results from two large-scale surveys of a nationally representative sample of the cohort (Year 6 students aged 10/11, $n=9319$; Year 11 students aged 15/16, $n=13,463$), this research explores shifts in attitudes and aspirations in science and extends the unique dataset provided by the first ASPIRES study, which tracked the development of this cohort's science and career aspirations from age 10-14. Further multivariate analyses investigating possible predictors (i.e. parental attitudes to science, student attitudes towards school science, self-concept in science, engagement in science-related activities outside of school) of students' aspirations in science will also be presented.

Motivation and interest-development in traditional physics classrooms in Norway

Presenting Author: Maria Vetleseter Boe, University of Oslo, Norway

Traditional physics teaching, dominated by teacher-centered instruction and problem solving (Angell, Guttersrud, Henriksen, & Isnes, 2004; Duit, Schecker, Höttecke, & Niedderer, 2014), has been criticized for not being inclusive towards different motivations, interests and identities (Hazari, Sonnert, Sadler, & Shanahan, 2010). This study starts from previous survey results about Norwegian secondary students' motivation for choosing physics and uses data from 18 interviews with

$N=9$ secondary physics students to investigate how their interest-development and motivation were influenced by their experiences in traditional physics classrooms. The data were analyzed thematically (Braun & Clarke, 2006) and understood in the light of expectancy-value theory of motivation (Eccles & Wigfield, 2002) and the four-phase model of interest-development (Hidi & Renninger, 2006). The analysis reveals how similar classroom experiences can have very different impact on students' interest-development and demonstrates how nuances in students' initial motivation for choosing physics help us understand why. For example, traditional mathematical problem solving threatened to destroy the interest of a student initially motivated by experiments and qualitative discussions, while the same activity was a necessary tool for another student, who counted on such mastery experiences for developing her interest. The study adds to the understanding of how different expectancy-value factors of motivation influence how physics students react to classroom experiences, and in turn, how the interplay of initial motivation and classroom experiences influence students' ongoing interest-development and motivation.

What Makes the Difference for Highly Selective Undergraduates Who Continue to Pursue STEM?

Presenting Author:K. Ann Renninger, Swarthmore College, United States; **Co-Author:**Sarah Nielson, Swarthmore College, United States; **Co-Author:**Meg Nam, Swarthmore College, United States

This presentation reports on findings from an exploratory, mixed method, use-informed study of undergraduates who continued to pursue STEM majors in a highly selective institution. Students who continue to pursue STEM are typically not the subject of study, because they do continue. Data sources for the present study were institutional data, a survey, and an in-depth interview. The Four-Phase Model of Interest Development (Author, 2006; Author, 2016) provides the theoretical framework for studying interest in relation to other motivational variables (e.g., goals, self-concept of ability, future time perspective) and background information (e.g., high school experiences, family involvement in science). Findings indicate that having a more developed interest is central. The students' were all identified as having a well-developed interest in their STEM major. The students describe themselves as interested in mastering the material, and describe the discipline in which they are working as challenging, rather than difficult. Many students described themselves as believing on beginning their undergraduate classes that competent students complete their work independently. They described the importance of transitioning to being able to work with others, to ask questions of professors, and to learn to put work down and return to it rather than expecting to get it correct the first time. Study findings suggest that future studies of students' understanding of their approach to and use of supports to work with challenging STEM content.

Research Microcultures as Socialization Contexts for Underrepresented Science Students

Presenting Author:Dustin Thoman, San Diego State University, United States; **Co-Author:**Gregg Muragishi, Stanford University, United States; **Co-Author:**Jessi L. Smith, Montana State University, United States

Is the process of engaging in scientific research an effective context for supporting and socializing undergraduate students for work in STEM fields? We tested this question in the context of a research experience for undergraduates working in faculty-led laboratories, with a focus on underrepresented minority (URM) students, who were primarily Latino and Native Americans. Beyond skills development, working in a research lab provides a critical peer group socialization context, where students often experience their first glimpse of what it means to "become a scientist" through day-to-day experiences and interactions with labmates. Of course, not all labs are the same. Outcomes of this socialization process should therefore differ across labs. Longitudinal survey data were collected from 522 research assistants in 42 labs at 6 institutions in the United States. Using multilevel modeling, results supported a socialization effect for URMs. That is, over and above the student's own initial beliefs, the aggregate prosocial affordance beliefs of one's labmates predicted students' own beliefs, as well as students' subsequent experiences of interest in their research and science career interest. Findings were unique to prosocial affordance beliefs, as subsequent analyses ruled out key alternative explanations related to other beliefs about science and cross-lab differences in labmates' sense of belonging. Results demonstrate that research labs serve as microcultures of information about science norms and values that influence motivation, which URM students are particularly sensitive to, and efforts to broaden participation should include understanding group processes that convey such values.

Symposium

Learning and Social Interaction

Co- and Self-Regulation in Early Childhood – Assessment, Development and Influencing Factors

Keywords: Cognitive development, Developmental processes, E-learning / Online learning, Early childhood education, Parental involvement in learning, Self-efficacy, Self-regulation, Social interaction, Video analysis

Interest group: SIG 16 - Metacognition

Chairperson: Kim Gärtner, Heidelberg University, Germany

Discussant: Franziska Cohen, Freie Universität Berlin, Germany

Self-regulatory and metacognitive skills are developmental hallmarks in early childhood and important prerequisites for successful learning and academic success (McClelland & Cameron, 2012). Individual differences in children's self-regulation are consistently associated with a range of parental co-regulation behaviors, which help young children progress

from being externally (co-) regulated to more internally self-regulated (Bernier, Carlson, & Whipple, 2010; Fay-Stammbach, Hawes, & Meredith, 2014). Although research regarding co- and self-regulation in early childhood has extended over the last decade, questions remain open regarding theoretical and conceptual as well as methodological issues (e.g. McClelland & Cameron, 2012). The symposium focuses on the following questions regarding the development and interplay of co- and self-regulation across different age-groups (from infancy to preschool): How can self-regulatory behaviour be measured and observed across age groups and in different situations? How do parents support the development of self-regulation from infancy to preschool? How do contextual factors (e.g. home environment, parental stress, etc.) influence children's self-regulation as well as parental co-regulation in early childhood? The symposium gives new insights into the development, assessment and interplay of co- and self-regulation in early childhood, as well as influencing factors. Theoretical and practical implications can be derived (e.g. parent training) to support children's self-regulation at an early stage.

Maternal scaffolding with infants: stability and relations with cognitive and inhibitory development

Presenting Author: David Whitebread, University of Cambridge, United Kingdom; **Co-Author:** Dave Neale, University of Cambridge, United Kingdom

There is debate about the extent to which parents influence the early development of executive function through play-based scaffolding, and how consistent parents are in their scaffolding style with infants. This study assessed the consistency of scaffolding over time and with different toys, and whether parental scaffolding related to concurrent measures or predicted future measures of child inhibitory control and cognitive development. Thirty-six British mother-child dyads were assessed when children were 12, 18 and 24 months old. At each time point dyads were video-recorded engaged in natural play behaviour with their child with a ring toy and, at 12 months, with stacking cups. The following tests of the child's inhibitory control were administered: The 'Grasping Task', An object-retrieval task using a spoon laden with food at 12 months; two delay of gratification tasks at 24 months; and The BRIEF-P parent-report inhibition scale at 24 months. The Bayley Scales of Infant Development III Cognitive Scale was also administered at 18 months. The results suggest that mothers who either a) demonstrate high levels of contingency during scaffolding when infants are 12 months old, or b) consistently demonstrate a moderate to high level of contingency and reduce their level of directiveness across their infant's second year of life, have children who develop higher inhibitory control and perform at higher levels on standardised tests of cognitive development. The relationship between contingency and inhibitory control suggests that maternal behaviour during play could lay the foundations for the strategic regulation of cognition and behaviour.

Co- and self-regulation in early childhood – the role of parental self-efficacy beliefs

Presenting Author: Kim Gärtner, Heidelberg University, Germany; **Co-Author:** Verena Clara Vetter, Heidelberg University Hospital, Centre for Child and Adolescent Medicine, Germany; **Co-Author:** Gitta Reuner, Heidelberg University Hospital, Centre for Child and Adolescent Medicine, Germany; **Co-Author:** Silke Hertel, Ruprecht-Karls-Universität Heidelberg, Germany

The development of self-regulation (SR) is one of the hallmarks in early childhood. Individual differences are consistently associated with a range of parental co-regulation (CR) behaviors, among them parental scaffolding (Fay-Stammbach, Hawes, & Meredith, 2014). Parental self-efficacy beliefs, i.e. parents' perceived ability to positively influence their child's behavior and development, have been identified as key correlates of such parenting practices (Coleman & Karraker, 2003; Sanders & Woolley, 2005) as well as associated with child outcomes (Jones & Prinz, 2005). However, there is a lack of research regarding the relation of parental self-efficacy, parental CR and children's SR in early childhood. The present study aims to analyze the influence of parents' self-efficacy beliefs (domain-general and -specific) and parental co-regulation on children's SR in early childhood. Preliminary results are based on a sample of 55 parent-child dyads (children's age: 24 – 36 months). A multi-method approach (questionnaires, standardized tasks, video-observation of parent-child interactions) is applied to assess children's SR, parental CR and parents' self-efficacy beliefs. First results point towards significant relations between children's SR at two years of age and parents' CR behavior. Parents' self-efficacy beliefs (domain-general and -specific) explain a unique portion of variance, over and above parents' CR. Behavioral data regarding children's SR as well as parents' CR will be included in further analyses to strengthen these findings.

Executive functions and parent-child interaction during technology-enhanced storytelling

Presenting Author: Anne Horvers, Radboud University Nijmegen, Netherlands; **Co-Author:** Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:** Rosa Teepe, Radboud University Nijmegen, Netherlands; **Co-Author:** Ludo Verhoeven, Radboud University Nijmegen, Netherlands

This study explores how children's executive functions influence the way parent and child engage in a technology-enhanced story telling activity (TES). Research has indicated that children's executive functions (inhibitory control, memory and cognitive flexibility) are related to how they engage in reading activities, computer learning activities and explain instructional effects thereof. Also parent-child interaction is influenced by the child's executive functions. The app Jeffy's Journey supports shared verbal storytelling of parent and child with real time support through a story structure and visual, auditory and textual prompts. 44 Parent-child dyads played this a newly developed app. The results indicate that although the time spent on the TES activities was not associated with the child's EF and that the usage of prompts was positively related to the child's cognitive flexibility. Additionally cognitive flexibility was also positively associated with interactive parent-child interaction and highly yet not significantly correlated with story related utterances. These findings indicate the

importance of cognitive flexibility for active storytelling activities. No relation between memory and inhibitory control were found neither for TES characteristics (time spend or prompts used) nor parent-child interaction.

Associations between parenting and children's executive functions: Contingent on assessment methods?

Presenting Author: Debora Valcan, Murdoch University, Australia; **Co-Author:** Deborah Pino-Pasternak, Murdoch University, Australia; **Co-Author:** Helen Davis, Murdoch University, Australia; **Co-Author:** Anabela Malpique, Murdoch University, Australia

This paper investigates whether associations between parenting and young children's executive functions (EF) vary contingent on the parenting measures used (self-report vs. observed). It was hypothesized that, regardless of measurement, positive parenting would be associated with higher performance in EF tasks, whereas negative parenting would be associated with lower EF performance, both concurrently and longitudinally. Associations between discrete dimensions of parenting and measurement are to be explored. The study reports on Time 1 (T1) and Time 2 (T2) of a longitudinal study exploring contextual predictors of EF in preschool children in Australia. At T1, 176 children (159 retained at T2) and 134 of their caregivers participated in the study. At T1, caregivers completed a battery of questionnaires investigating different dimensions of parenting. They also participated in two video-recorded play activities with their children. Concurrently and six months later, children were assessed using a battery of EF involving separate assessments of inhibition, shifting, and updating. A two-factor model of EF was found where attention shifting was separable yet related to an inhibition/updating factor, both at Times 1 and 2. Analysis of the self-reported data indicated that, parental control was the only parental behaviour associated with EF, showing negative correlations with shifting at both time points. The next step in our analysis is to code video-recorded parenting behaviors at T1 to explore the extent to which the above-mentioned associations vary when using a different measure of parenting. Results on this latter analysis will be reported at the time of the conference.

Symposium

Motivational, Social and Affective Processes

Insights on student engagement: the roles of motivation, emotion, and well-being

Keywords: Developmental processes, Educational Psychology, Emotion and affect, Motivation, Motivation and emotion, Primary education, Qualitative methods, Quantitative methods, Quasi-experimental research, Secondary education, Self-regulation, Social interaction

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Jennifer Symonds, University College Dublin, Ireland

Discussant: Janne Pietarinen, University of Eastern Finland, Finland

This symposium presents a lively collection of papers from Ireland, the United States and Finland with the aim of explicating how student engagement links to motivation, emotion and well-being. First, we launch a novel model of student engagement: focusing on how situational engagement operates within individuals in real time and drawing on the research from neuroscience, cognitive psychology and social developmental psychology. We then present new evidence on the role that anxiety plays when students are in a state of optimal engagement, referring to data gathered using experience sampling. We also discuss the types of emotions that students perceive in classroom and school recess settings, when they are given pictorial vignettes of ambiguous behaviours. Finally, we examine how enhancing emotional regulation and attachment impacts students' social, emotional, and academic development, in a quasi-experimental setting. Together these papers provide fresh insights into how educators can prospectively enhance student engagement by attending to students' motivation, positive emotion and well-being.

A new model of student engagement as a dynamic biopsychosocial process

Presenting Author: Jennifer Symonds, University College Dublin, Ireland; **Co-Author:** Katja Upadyaya, University of Helsinki, Finland; **Co-Author:** Katariina Salmela-Aro, University of Jyväskylä and University of Helsinki, Finland

Sustaining involvement in an academic task such as learning at school, college or university, is a deeply complex activity. There, learners consciously and unconsciously manage aspects of their minds, bodies and the social environment to stay engaged. In this theoretical paper, we present a new model of student engagement as the situational self-regulation of psychological, emotional, physiological and social, resources and demands. We illustrate this with a real-world example where we explore how those resources and demands interact within real time. In the example we focus on latent psychological investment and its role in motivating engagement, as well as explore how psychological investment and other resources and demands can be altered through the process of engaging. We discuss how this model of situational engagement plays out across the life-span and within developmental stages, drawing on key theories from social developmental psychology. Next we consider the implications of the model for measurement, reviewing established methods and considering new ones. Finally, we discuss how the model can be used in intervention research, drawing on a study of young adults and linking the model to social and emotional learning in schools.

States of flow and situational engagement: not beyond anxiety, but right at the heart of it

Presenting Author: Julia Moeller, Yale University, United States; **Co-Author:** Zorana Ivcevic, Yale Center for Emotional Intelligence, United States; **Co-Author:** Marc Brackett, Yale Center for Emotional Intelligence, United States; **Co-Author:** Arielle White, Yale Center for Emotional Intelligence, United States

In this paper, flow or situational engagement is defined as situations that issue high challenges and require high skills and considered optimal motivation, in which learners experience absorption, strong concentration, and positive emotions. While the flow theory states that anxiety is low in flow states, the theory of challenge and threat states in athletes (TCTSA) predicts that all challenging situations, including flow, elicit anxiety, and that the skill level determines whether this anxiety is motivating and beneficial, or inhibiting and harmful. We tested both theories and found that flow states come with high anxiety and stress, as predicted by the TCTSA.

Sixth and eighth graders' socially embedded emotions in formal and informal school situations

Presenting Author: Henriika Anttila, University of Helsinki, Finland; **Co-Author:** Kirsi Pyhältö, University of Oulu / University of Helsinki, Finland; **Co-Author:** Tiina Soini-Ikonen, University of Tampere, Finland; **Co-Author:** Janne Pietarinen, University of Eastern Finland, Finland

There is evidence that emotions play an important role in learning, social relationships and school attendance (Pekrun, Goetz, Titz, & Perry 2002). However we know surprisingly little about emotions embedded in teacher-pupil interaction and in peer interaction in school. Moreover emotions embedded in recess situations have not, as far as we know, been studied in research literature. Altogether 148 6th and 8th graders participated in the study. The data was collected with a picture task instrument and were qualitatively content analysed. Preliminary results showed that students reported a wide variety of emotionally loaded social embedded episodes related to both teacher-pupil and peer interactions. Pupils often described experiences of joy and anger towards the teacher in teacher-pupil interactions where as belonging and being left outside of a group were emphasized in peer interactions. Moreover, pupils emphasized peer interactions in recess settings and the teacher-pupil interactions in classroom settings. Preliminary results provide new insights into the emotion literature about pupils' socially embedded emotions in formal and informal school settings, particularly regarding peer and teacher-pupil interactions.

Early intervention for pupils at risk of underachievement and educational disengagement

Presenting Author: Seaneen Sloan, University College Dublin, Ireland; **Co-Author:** Karen Winter, Queen's University Belfast, United Kingdom; **Co-Author:** Fiona Lynn, Queen's University Belfast, United Kingdom; **Co-Author:** Aideen Gildea, Queen's University Belfast, United Kingdom; **Co-Author:** Paul Connolly, Queen's University Belfast, United Kingdom

Nurture groups offer a short term, early intervention for vulnerable pupils at risk of underachieving and disengaging from school, aiming to address barriers to learning arising from unmet attachment needs. This presentation discusses findings from an evaluation of nurture groups which used a quasi-experimental approach and compared the progress of pupils (in terms of social, emotional and behavioural functioning, enjoyment of school and academic attainment) attending a nurture group to similar pupils not attending nurture groups. Findings suggest that nurture groups have a consistent, significant and large effect in improving social, emotional and behavioural outcomes and pupil enjoyment of school.

Symposium

Assessment and Evaluation

Transparency in assessment – Exploring the influence of explicit assessment criteria

Keywords: Achievement, Assessment methods and tools, Communities of practice, Higher education, Literacy, Motivation, Science education, Student learning, Teacher Professional Development

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Anders Jonsson, Kristianstad University, Sweden

Organiser: Anders Jonsson, Kristianstad University, Sweden

Discussant: Frans Prins, Utrecht University, Netherlands

Whether explicit assessment criteria should be shared with students is a controversial issue. On the one hand, research has shown that explicit criteria may positively affect student performance, reduce their anxiety, as well as support students' use of self-regulated learning strategies. On the other hand, there are fears that explicit criteria may have a restraining influence on students' learning, as well as limiting their autonomy and creativity. There are also indications of students becoming more performance oriented, as opposed to learning oriented, when being provided with explicit assessment criteria. Taken together, it is not fully understood under which circumstances it is productive for student learning to share explicit assessment criteria, and under which circumstances it is not. The aim of this symposium is therefore to bring different perspectives on transparency in assessment together, in order to further our understanding of how students are influenced by the use of explicit assessment criteria. A deeper understanding of the influence of explicit assessment criteria on students' understanding of criteria, motivation, and learning is equally imperative for future research and educational

practice, both of which need to go beyond individual opinions and convictions. The papers in this symposium are of both conceptual and empirical nature, and represent a range from students' and teachers' understanding and use of assessment criteria, to the conceptualization of standards and the influence on students' motivation and performance.

Can rubrics make assessment standards and criteria transparent?

Presenting Author:Berry O'Donovan, Oxford Brookes University, United Kingdom

This presentation explores the limitations of rubrics and the role of tacit knowledge in rendering assessment criteria and standards transparent to students. It is based in over a decade of published research into assessment standards undertaken by members of the ASKe (Assessment Standards Knowledge exchange) Centre of Excellence in the UK. Students hunger for transparency in assessment expectations, criteria and standards (Jonsson, 2014) and a well-designed rubric can go some way to assuage this desire. However, perhaps provocatively, the argument presented is that a single-minded focus on the explicit articulation of assessment standards and criteria, whilst currently the dominant logic of higher education, will inevitably fall short of providing students with meaningful knowledge of standards and criteria (Rust et al., 2003; O'Donovan et al, 2004). Initially the presentation, drawing on previously published research, briefly reviews the obstacles involved in articulating marking criteria and standards clearly and accurately, and in synchronising the interpretation of such understandings held by students and staff both within and across disciplines (O'Donovan et al., 2004, 2008; Sadler, 2009; O'Donovan, 2016). However, the main focus is on the role that tacit knowledge transfer processes play in the effective sharing of meaningful knowledge on assessment standards and criteria. Ultimately, based on empirical research undertaken with 300 business and management students at Oxford Brookes University over 3 years it is posited that a spectrum of both explicit and tacit knowledge transfer methods is needed to develop student understanding of assessment criteria and standards and thereby their assessment literacy.

Effects on student motivation and performance by increased transparency in assessment

Presenting Author:Andreia Balan, SFF Helsingborg, Sweden; **Co-Author:**Anders Jonsson, Kristianstad University, Sweden

Sharing criteria with students may improve performance, reduce anxiety, and support students' self-regulation. But students may also become more performance oriented. Overall, there is a lack of studies systematically investigating how students are influenced by the use of explicit criteria. The aim of this study is therefore to investigate the influence of increased transparency in assessment on student motivation and performance. The study is an intervention, where transparency in assessment is increased successively over four teaching sequences for a total of eight groups of students from four different schools (students 12-13 years; n = 145). During the first sequence, all students are taught the same (science) content and experience the same level of transparency. For each successive sequence, two groups remain at the previous level of transparency, while the transparency is increased for the rest. For all groups, performance tests and motivation questionnaires are distributed before the intervention and after each sequence. Initial findings show that students rate their self-efficacy and perception of self-regulation strategies as relatively high (4.72 and 4.53 respectively, on a 6 point scale). Furthermore, students' ratings on the achievement goals scale is substantially higher (5.38) as compared to the performance goals scale (3.14). If the use of explicit criteria makes students more performance oriented, this relationship is expected to change. Ratings on the self-efficacy and self-regulation scales should also be expected to increase. The study is expected to have great significance for both future research and educational practice.

Problematising representative perspectives of standards in the assessment discourse

Presenting Author:Rola Ajjawi, Deakin University, Australia; **Co-Author:**Margaret Bearman, Deakin University, Australia

Assessment practices such as rubrics, self-assessment, scoring and feedback all require judgements in relation to assessment criteria or 'standards'. Bowker and Star (1999) define standards as any set of agreed-upon rules for the production of textual or material objects. In assessment, there is a general sense that standards are necessarily the same across contexts. Standards are typically viewed as representative, that is, stable materials that describe particular realities of practice often expressed as prescribed lists of competencies or learning outcomes. A sociomaterial framing of standards has an alternative perspective. In addition to being a representation, standards can also be viewed as an activity in which people might participate. In other words, standards, and by extension, checklists and rubrics, are performative. In performing a standard there is a necessary translation or 'strategic juggling of representational ambiguity' that settles the problem of difference at the local level. Implications for assessment design include recognising the complexity of articulations of standards and the need for multiple enactments of them. Students can then be attuned to the educational processes that promote shared understanding of quality, recognising the layers of complexity in the standards. Such a view forces a rethink about what 'transparency' means and how we can best achieve it.

Assessment criteria and standards, social moderation and professional conversations about quality

Presenting Author:Claire Wyatt-Smith, Australian Catholic University, Australia

This presentation explores an inquiry approach to school-based assessment that takes account of both teachers' and learner's perspectives. It takes up three related concepts: evaluative expertise; the source of criteria; and social moderation. The latter involves groups of teachers engaging in professional conversations about student work using assessment criteria and standards. In taking a specific focus on social moderation the presentation draws on Wenger (1998) and his notion that meaning is continually negotiated through participation in "communities of practice". Three dimensions that bring coherence to a community of practice are central to the presentation: mutual engagement, joint

enterprise and a shared repertoire of concepts, tools, and terminology. The presentation offers key insights into teacher and student use of criteria and standards as a collective process of negotiation in the context of social moderation and in classrooms. It also shares insights from three studies undertaken by the author that show how teachers negotiated responses to one another in moderation event. Data will be presented to show how, as middle years teachers and senior teachers participated in moderation, they achieved mutual accountability that was valued as an integral part of their professional practice. A related focus is on how, through developing teachers' evaluative expertise, students can be supported to move from being a 'good' students to developing understandings of 'quality'/good work in a range of curriculum areas.

Symposium

Assessment and Evaluation, Culture, Morality, Religion and Education, Motivational, Social and Affective Processes

Citizenship Competence and Citizenship Identity: National Additions to ICCS 2016

Keywords: Achievement, Attitudes and beliefs, Citizenship education, Cultural diversity in school, E-learning / Online learning, Educational Psychology, Quantitative methods, Secondary education, Social development

Interest group: SIG 13 - Moral and Democratic Education

Chairperson: Eveline Gutzwiller-Helfenfinger, University of Teacher Education of Lucerne, Switzerland

Discussant: Maria Magdalena Isac, University of Groningen, Netherlands

The International Civic and Citizenship Education Study (ICCS 2016) provides insights into political socialization of 14-year olds in the context of national school systems. In particular, the study focuses on students' civic knowledge, identity, attitudes and participation, and examines how school and learning environments outside of school contribute to relevant learning processes and outcomes. In addition to the international core of the study, individual countries may address specific research questions. The symposium will provide inside into four national add-ons. While the first part of the symposium is closely related to the concept of active citizenship and participation, the second part of the symposium focuses on the development of cultural and civic identities: First, to what extent do school and personal characteristics such as academic achievement of 9th graders predict online political participation in Norway? Second, how do 8th and 12th grade students in Belgium differ with regard to civic competences and how is civic competence related to the perception of active citizenship? Third, how does students' openness for identity exploration predict tolerance towards refugees in Germany? Fourth, do German adolescents with and without migration background differ in their perception of educational inequality and how do acculturation strategies influence this perception among immigrant students?

Association between Online Political Discussion and Academic Achievement of Norwegian adolescents

Presenting Author: Lihong Huang, Høgskolen i Oslo og Akershus, Norway; **Co-Author:** Kristinn Hegna, NOVA – Norwegian Social Research, Oslo and Akershus University College of Applied Sciences, Norway; **Co-Author:** Guro Odegard, NOVA – Norwegian Social Research, Oslo and Akershus University College of Applied Sciences, Norway

Using data obtained a set of country specific questions included in the International Civic and Citizenship Education Study (ICCS) 2016 (N=6235), this paper reports our analyses on the association between adolescents' participation in online political discussions and their academic achievement in civic related subjects in Norwegian lower secondary schools. There is generally a lack of both knowledge and understanding on the actual political participation of youth and particularly that of adolescents (as becoming-citizens between the ages of 13-18). So far, there is little research evidence that young people's internet use has any effect on their political participation (Quintelier and Vissers 2008) and we know little as about what factors actually affect political participation on the internet. This study aims to contribute research evidence to current knowledge and understanding in 1) the scope and reasons of adolescents' political participation on the internet, and 2) the association between political participation on the internet and learning achievement in the school.

Social development in school: A comparison of civic competences between 8th and 12th grade students

Presenting Author: Dorien Sampermans, KU Leuven, Belgium; **Co-Author:** Ellen Claes, KU LEUVEN, Belgium

The civic engagement of future generations is a crucial element in democratic societies. Therefore democratic countries attach much importance to the civic education of young adolescents in school. This paper aims to measure school influences on the social development of young adolescents. To create civic consciousness and engage secondary school students, teachers not only transfer civic knowledge. We increasingly assume schools to be a mini-polity, in which students can learn to interact with the society and where they learn to value their participation. It is by reaching these civic competences that students can become engaged citizens. To measure social school influences, this paper compares the results of the Flemish ICCS 2016 data with the Flemish educational effectiveness and evaluation survey. Both surveys measure civic knowledge and attitudes and are administered parallel in Flemish schools. The first study is administered among eight grade students, the latter among twelfth graders. Comparing the results of these studies reveals a growth of civic competences (civic knowledge, reported participation levels and students' self-efficacy) over age. And parallel to this higher critical consciousness, older students seem to perceive good citizenship more often as engaged citizenship. The relationship between students' engagement and their civic competences can be confirmed by a regression analysis and

visualized in two structural equation models. Both path models then illustrate the dependency between students' perceptions of good citizenship and students' civic competences.

Identity Formation as Catalyst of Tolerance

Presenting Author:Johanna Fee Ziemes, University of Duisburg-Essen, Germany; **Co-Author:**Hermann J. Abs, University of Duisburg-Essen, Germany

Even though identity formation (IF) is primary development task of the adolescence and important for the cohesion of a democratic and diverse society, it is a neglected topic of citizenship education. In the recent cycle of the International Civic and Citizenship Education Study (ICCS 2016) IF was assessed with indicators of exploration and commitment, while tolerance was measured with items on rights of refugees. Preliminary results indicate that identity exploration enhances tolerance, while commitment reduces tolerance. These results augment our understanding of the contact hypothesis: Identity exploration may increase the readiness to make contact with minorities, while commitment may increase the desire for distance.

Acculturation as an indicator of educational inequality

Presenting Author:Janina Jasper, University of Duisburg-Essen, Germany; **Co-Author:**Hermann J. Abs, University of Duisburg-Essen, Germany

Globalization and migration require a complex negotiation of cultural identity to ensure social and political participation. In particular, adolescents with migration background are challenged in their identity development during acculturation. Often they suffer discrimination due to intolerance, which leads to educational inequality. For this paper it will be examined whether students with and without migration background differ in their perception of inequality, and how acculturation strategies influence this perception among immigrant students. Preliminary results show that students with migration background have a more negative perception of educational inequality than their peers. In particular, marginalized students perceive more educational inequality in Germany, while their integrated peers tend to perceive chances for education in Germany rather more equal.

Symposium

Teaching and Teacher Education

Investigating in-service and pre-service teachers' promotion of SRL through classroom observation

Keywords: Assessment methods and tools, Attitudes and beliefs, Educational Psychology, Metacognition, Pre-service teacher education, Self-regulation

Interest group: SIG 16 - Metacognition

Chairperson: Zemira Mevarech, Bar-Ilan University, Israel

Discussant: Erik De Corte, KU LEUVEN, Belgium

Teachers play a key role in supporting and enhancing their students' self-regulated learning (SRL). However, from meta-analyses it is known that teachers are relatively ineffective in training SRL among their students. This leads to two implications for research: (1) In order to find out what makes teachers less effective in promoting SRL, we need assessment methods to capture teachers' promotion in a valid and reliable way. Classroom observations offer the opportunity to assess teachers' instructional behavior independent of self-report bias. (2) With regard to teacher development, we need training methods to help prospective teachers promote SRL. In this symposium we integrate four studies that use observation methods to assess (prospective) teachers' promotion of SRL. The first two studies report results from classroom observations with in-service teachers and compare the observed promotion of SRL with teachers' own perception of promoting SRL and with teacher beliefs on SRL. The last two studies focus on teacher training and compare different methods to teach preservice teachers how to promote SRL with the help of classroom video. They systematically vary the direction of reflection onto different types of SRL strategies, as well as the degree of direction towards a certain SRL strategy. This symposium contributes to the field of SRL by applying innovative methods (systematic analyses of video-based classroom observation data) that allows for quantitative analyses in order to further investigate how in-service teachers support their students in SRL, and how preservice teachers can be trained in delivering such a support for SRL.

Insights into teachers' promotion of SRL in primary and secondary mathematics classrooms

Presenting Author:Charlotte Dignath, Goethe-University Frankfurt, Germany; **Co-Author:**Gerhard Buettner, University of Frankfurt, Germany

Two video-based observation studies were conducted using a highly structured observation instrument to assess primary and secondary school teachers' promotion of self-regulated learning (SRL) by rating teachers' implicit and explicit instruction of strategies and their arrangement of a learning environment that enhances students' self-regulation. Additionally, secondary school teachers participated in a semi-structured interview to confront objective classroom

observations with teachers' subjective views.

Classroom observations revealed that teachers spend only very little time on explicit strategy instruction. Moreover, they rather instruct cognitive strategies, but very few metacognitive strategies. These results are more pronounced in primary than in secondary school classrooms. By contrast, primary school teachers provide students more often with learning environments that require student-regulation than secondary school teachers do. Teacher interviews revealed that teachers are rather reluctant towards the promotion of SRL.

The results show that there is still a strong need for teacher training on enhancing SRL directly and indirectly. In particular teachers lack explicit strategy instruction and addressing of metacognitive strategies during their teaching.

Exploring diversity in teachers' implementation of self-regulated learning in primary schools

Presenting Author: Mona De Smul, University of Ghent, Belgium; **Co-Author:** Hilde Van Keer, Ghent University, Belgium;

Co-Author: Sofie Heirweg, Ghent University, Belgium; **Co-Author:** Geert Devos, Ghent University, Belgium

Although the importance of promoting self-regulated learning (SRL) in primary education is often stressed, mixed-method research investigating the role of the teacher in this respect is scarce. Therefore, the present study investigates primary school teachers' promotion of SRL combining and comparing both quantitative (i.e., self-report questionnaires) and qualitative data (i.e., semi-structured interviews and classroom observations). Moreover the study aims at studying differences between schools reporting a comprehensive versus a limited implementation of SRL in daily practice. Based on survey data of 331 teachers from 44 schools in Flanders, six schools were selected for further qualitative research.

Preliminary results are discussed and based on the results, implications for teacher professional development by means of an innovative school improvement program are presented.

Effects of Scaffolding Level on Preservice Teachers' Professional Vision & Capacity to Teach SRL

Presenting Author: Tova Michalsky, Bar-Ilan University, Israel

A major concern of teacher educators is how teachers acquire expertise to positively develop students' self-regulated learning (SRL). Accordingly, teachers are asked to understand the role of SRL in their pedagogical content knowledge, to plan materials and strategies for infusing SRL into lessons, and finally to reflect on their actions and decisions in order to evaluate goals, processes, and efforts (Putnam & Borko, 2000). However, research findings suggest that SRL is difficult to attain by preservice teachers (e.g., Perry, et al., 2007; Kramarski & Michalsky, 2010), who lack experience in producing knowledge in new situations and who lack skills as analytical competency practitioners (Schön, 1995). Methods of digital video case-based learning are considered to have great potential for promoting reflective and problem-solving abilities as well as other higher level cognitive competencies related to analytical competency (e.g. Lundeborg, 1999). To meet the growing challenges for SRL-promoting teacher preparation, the current study aimed to explore preservice teachers' capacity to analyse video-cases of complex SRL-teaching events by developing their professional vision (PV) and aimed to compare the training effects of different scaffolding paths (the autonomous path; the hint path, and the guided path) on the depend variables PV for SRL and direct and indirect SRL-teaching to their students. Findings demonstrated that the *Hinted* approach led to better performance on teachers' use of SRL in their PV for SRL and actual SRL teaching as measured directly (implicit/explicit SRL-promoting strategy instruction), and indirectly (construction of SRL-promoting environments).

The Effects of Using Video Clip Analyses on Teachers' Explicit vs Implicit Implementations of SRL

Presenting Author: Zemira Mevarech, Bar-ilan University, Israel; **Co-Author:** Tova Michalsky, Bar-Ilan University, Israel;

Co-Author: Galit Shabtai, Bar-Ilan University, Israel

The use of video clip analyses that focus on teachers' behaviors has become a quite common practice in professional development courses. Usually, a lesson is recoded, segments or clips of the films are shown to teachers, and those clips are analyzed by the participants. The present study took another approach. Rooted in the SRL research, the study addresses the following questions: To what extent teachers' who are exposed to different types of video-clip analyses would develop different levels of pedagogical content knowledge, and would also implement different SRL strategies in their teaching? About 50 mathematics teachers participated in the present study. They all watched the same video-clips that recoded 'good' mathematics teaching. Teachers were randomly assigned into four research groups, as follows: Group A (control group) analyzed the clips as the teachers suggested; Group B analyzed the clips by focusing on the motivational aspects; Group C analyzed the cognitive-metacognitive aspects of the teaching; and Group D focused on all three components of SRL: cognition, metacognition, and motivation. Results showed significant differences between the four groups on all dependent variables. In particular, Group D developed a higher level of pedagogical content knowledge and also implemented significant higher levels of explicit SRL skills than group C, which in turn were significantly higher than those of Group B; the control group scored significantly lower than all other three groups. The theoretical and practical implications will be discussed in the conference.

Session F 18

30 August 2017 15:45 - 17:15

Main Building A - A05

The role of theory in research

Keywords: Action research, Argumentation, Communities of practice, Conversation / Discourse analysis, Emotion and affect, Peer interaction, Philosophy, Reflection, Reflective society, Social aspects of learning and teaching, Social interaction, Synergies between learning - teaching and research, Teacher Professional Development, Values education

Interest group: SIG 25 - Educational Theory

Chairperson: Giuseppe Ritella, University of Helsinki, Finland

Organiser: Rupert Wegerif, University of Exeter, United Kingdom

Discussant: Baruch Schwarz, Hebrew University of Jerusalem, Israel

What is the relationship between theories of education and empirical research in the field of learning and instruction? Research studies are supposed to test theory and develop theory. But is this possible if theoretical assumptions have already determined what sort of thing is going to count as a finding? What is said to be found out about learning, motivation or cognition etc. only ever makes sense if we assume a theoretical framework including specific definitions of learning, motivation, cognition etc but any such theoretical framework, if ever made explicit, always turns out to be contestable. Empirical research cannot help but be intimately connected to theory since it is informed on the inside by theory. On the other hand perhaps some empirical researchers avoid engaging with theory because it seems futile to do so, discussions about the big picture – what is learning, what is thinking, what should we teach, what does it mean to be human etc - can appear unconnected to empirical evidence and so not part of the progress of scientific knowledge. The papers in this symposium all explore this difficult conundrum, each offering different approaches to relating theory and empirical research. We hope that this will stimulate discussion and progress in understanding how we can constructively integrate more engagement with theory into the business of EARLI.

The generality-concreteness antinomy, variance accounted for, and situation specificity

Presenting Author: Jean-Luc Patry, University of Salzburg, Austria

The aim of research is to develop and test theories. One function of theories is explanation of (educational) phenomena. But theories can never fully explain the phenomena under investigation. The degree of explanation can be expressed as "variance accounted for". In social behavior research it is very low (typically 10%) unless artificially increased through severe biases, such as using questionnaires. This low explanation power is due, among others, to the generality-concreteness antinomy: The more general a theory is, the less concrete it can be. Since theories are supposed to be very general, they cannot be concrete. This antinomy is particularly accentuated in social behavior research because of situation specificity (Patry, 1991). In research on personality and situation specificity, two different questions can be asked: (1) about differences between people, and (2) about differences in behavior within people, e.g., due to situational variance. Most research in education focus on (1), where within-person variance is treated as error in the measurement theoretical sense. This error is usually regarded as random, but typically it is systematic. To reduce this error, which deals with behavior changing from moment to moment and from context to context, we need to address within-person variance (according to question 2 above) in addition to the between-person variance (question 1). We hence need to integrate concepts of within-person variance in our theories: We need a theory of situation specificity that is compatible with the original theory in which we are interested. Principles for this integration are discussed.

Conceptualizing one's own teaching activity: An account of a teacher's expansive learning journey

Presenting Author: Antti Rajala, University of Helsinki, Finland; **Co-Author:** Annalisa Sannino, University of Helsinki, Italy

This paper discusses a study that aims to better understand the process of concept formation in research conducted by teacher researchers. We analyze such a process in the context of a teacher researcher's journey to develop an agency-centered pedagogical model as part of his PhD dissertation study. Our study explores how the theory of expansive learning (Engeström, 2014) can account for a dialectical and mutually transformative relationship between theory and practice in teacher research. The primary data comprise documents (research plans, diaries, published articles) and transcribed recordings of supervisory meetings. In the analysis, we identify expansive learning actions in the data and trace how the object of the teacher researcher's activity was reconceptualized in and through the expansive learning actions. Our initial analysis shows that the teacher researcher's journey into research can be characterized as a part of an expansive learning cycle. The analysis shows how he increasingly began to question aspects of his teaching activity. The pedagogical model that he constructed served for him as a tool that remediated his relations to students and helped him to reconceptualize students and pedagogy. In our presentation, we will illuminate the expansive dynamics of concept formation that accounts for these reconceptualizations. The study makes a methodological contribution to the discussions around teacher research by unpacking the concept formation involved in successful interaction between theory and practice.

Collaboration, creativity, embodiment and affect – a methodological journey

Presenting Author: Eva Vass, Western Sydney University, Australia; **Co-Author:** Gabriella Deszpot, Liszt Ferenc Academy of Music, Hungary

My research is situated in the *collaborative learning* literature, which aims to conceptualise and promote effective ways of thinking and learning together. Much of this literature places an emphasis on collective argumentation or joint reasoning

(Littleton, & Mercer, 2013). My earlier research on children's collaborative creative writing (Vass et al, 2014) found it paramount to combine such explanations with explorations of the affective and embodied dimensions of shared meaning creation. Such an expansion of focus is central in cognitive science (Johnson, 2007), and in research on artistic collaborations in music and theatre (Clayton, 2007; Sawyer, 2007), but less so in socio-cultural research. My work so far has developed in response to this challenge. This paper reflects on the current 'empirical juncture', which brings together a dialogic orientation towards meaning creation with a focus on the embodied dimensions of creative ideation or creative togetherness. In collaboration with the Liszt Academy of Music, I explore the Kokas pedagogy: an experiential extension of the Kodaly method of music education combining improvised movement and collective reflection. Based on observational data (video-recordings of 14 sessions in a Year 1 classroom) we have analysed children's embodied dialogues, capturing the nature and evolution of creative intersubjectivities. The data highlight how the physical dimensions of this pedagogy cultivated new modes of creative ideation, presenting unique challenges and opportunities in the observed educational context. Importantly, the data reconfirm my earlier positioning about the need to re-envision creative interthinking to encompass the affectively-constituted and embodied dimensions of thought.

Double-loop reflection and educational research

Presenting Author:Rupert Higham, University of Cambridge, United Kingdom; **Co-Author:**Rupert Wegerif, University of Exeter, United Kingdom

We answer the question as to the relationship between theory and empirical research by extending the double loop reflection model of learning widely used in practitioner education. The first loop is applying methods to find answers to research questions. The second loop is reflection on the often initially implicit assumptions that lie behind the empirical research design. In this way theory is linked to empirical research in a broad conception of science. Although progress in underlying philosophical frameworks is slow and often only quite indirectly related to empirical research, it is nonetheless real and ultimately grounded on evidence and argument just like any other area of science. Our aim is to show how we can avoid the false dichotomy of irrationally choosing cultural 'paradigms' or 'stances' on the one hand and a rejection of the relevance for research of philosophical debates about ontology and values on the other. We link our double loop reflection model of research both to the two phase psychological model of thinking outlined by Kahnemann of fast thinking and the less frequent and more costly slow thinking and also to the two types of science model of Kuhn who distinguished between normal science and revolutionary science. We illustrate our dialogic model with an example from recent empirical research on classroom talk in which initial assumptions were challenged by experience leading to a need to re-think those assumption by bringing in new high level theory.

Session F 19

Invited Symposium

Learning and Special Education

Classroom composition research on social-emotional outcomes

Keywords: Achievement, Emotion and affect, Primary education, Secondary education, Self-efficacy, Social aspects of learning and teaching, Social development, Social interaction, Special education

Interest group: SIG 15 - Special Educational Needs

Chairperson: Carmen Zurbriggen, University of Fribourg, Switzerland

Chairperson: Christoph Müller, University of Fribourg, Germany

Discussant: Dieter Baeyens, KU LEUVEN, Belgium

Social-emotional problems of students are an important risk factor for both behavioral and learning difficulties. It is thus crucial to understand how individual and contextual factors influence students' social-emotional development. Classroom composition research on social-emotional outcomes (CCRSO) contributes to this understanding by investigating the effects of classmates' characteristics on individual social-emotional development. Bringing together peer influence and school effectiveness research, this line of inquiry provides new perspectives on how classroom-level processes affect individual students. Four presenters and a discussant from three different countries will provide key insights on this topic.

Paper 1 provides a conceptual framework and research overview on CCRSO. Moreover, current methodological challenges and future directions of CCRSO are discussed.

Paper 2 examines the effects of sociocultural classroom composition on social integration of students with special educational needs in primary school. In particular, the paper aims to shed light on students' school satisfaction in inclusive classroom.

Paper 3 investigates how prosocial behavior among the classmates is related to future individual antisocial behavior among lower secondary school students. Results of longitudinal multi-level analyses provide evidence that classmates' higher levels of prosocial behavior are associated with a decrease in students' individual antisocial behavior.

Paper 4 examines the effect of social comparison with classmates on students' academic self-concept and teachers' frame of reference as moderating variable. For this purpose, two methods for the analysis of group composition effects are used and compared. Teachers' individualized frame of reference appears to influence the effect of academic classroom

composition on students' self-concept.

An overview of classroom composition research on social-emotional outcomes

Presenting Author:Christoph Müller, University of Fribourg, Germany; **Co-Author:**Carmen Zurbriggen, University of Fribourg, Switzerland

Classroom composition research on social-emotional outcomes (CCRSO) aims to systematically explore how characteristics of classmates are related to the social-emotional outcomes of children and adolescents. In this conceptual introduction to CCRSO it is first provided an insight into the scientific roots of CCRSO, namely peer influence research and school effectiveness research. It is then developed a conceptualization of research areas typically of interest in CCRSO, which comprises four different fields of inquiry. A brief review on exemplary studies in these areas of research is given. Finally, current challenges of CCRSO are presented. The contribution ends with a brief outlook on potential future research directions.

Does classroom composition affect school satisfaction of students with special educational needs?

Presenting Author:Katja Scharenberg, University of Education Freiburg, Germany; **Co-Author:**Wolfram Rollett, University of Education Freiburg, Germany; **Co-Author:**Wilfried Bos, TU Dortmund University, Germany

Analysing effects of the classroom learning environment is of special importance in inclusive education as mainstream classes are more heterogeneous regarding students' academic achievement and sociocultural origin, but benefits are assumed for all children (Ainscow & César, 2006). Studies examining effects of individual, peer and classroom variables for SEN students are rare (de Boer et al., 2013). Previous research found neutral or positive effects of inclusive education on achievement (Cole et al., 2004; Kocaj et al., 2014; Ruijs & Peetsma, 2009). There is, however, a lack of evidence regarding effects of inclusive education on non-achievement related, socioemotional outcomes (e.g. school satisfaction). Thus, our study examined whether 1.) classroom composition affects school satisfaction, 2.) such effects differ between sub-groups of at-risk students, and 3.) whether classroom composition mediates the hypothesised effect of SEN at individual level. Analyses based on a sample of 1,025 students in inclusive primary schools (Grade 4). SEN students (15.1%) were disadvantaged regarding socioemotional outcomes, but school satisfaction did not interact with sociocultural background. However, SEN students did not seem to benefit from attending classes with more privileged peers. The results indicate that process indicators might be more relevant for socioemotional outcomes in inclusive classrooms than contextual characteristics.

Antisocial behavior among adolescents: The influence of classmates' prosocial behavior

Presenting Author:Verena Hofmann, University of Fribourg, Switzerland; **Co-Author:**Christoph Müller, University of Fribourg, Germany

Prior research has revealed that the behavior within a classroom serves as a descriptive norm for individuals to behave in a certain way. While research often focused on negative peer influence, peers' prosocial behavior might in turn be associated with positive individual development. It was therefore presumed that classroom-level prosocial behavior would predict a decrease in antisocial behavior of individual students. Data were obtained from a longitudinal study of lower secondary school students in Switzerland ($N = 864$), from which data collection points at the end of Grade 7 and at the end of Grade 9 were used. Students completed self-reports on prosocial behavior, antisocial behavior, and antisocial attitudes, which were analyzed using multilevel models to control for clustering within classrooms. Results indicated that a higher level of prosocial behavior within a classroom significantly predicted a decrease in individual students' future antisocial behavior.

Comparison of the group actor-partner interdependence model and a latent-manifest contextual model

Presenting Author:Carmen Zurbriggen, University of Fribourg, Switzerland; **Co-Author:**Rob Gommans, Utrecht University, Netherlands; **Co-Author:**Martin Venetz, University of Applied Sciences of Special Needs Education Zurich, Switzerland

According to the big-fish-little-pond effect (BFLPE), students compare their own academic abilities with those of their classmates, and the information obtained then forms a reference that shapes students' academic self-concept. To counteract negative social comparison effects (e.g., a student with low achievement compares himself with higher-achieving classmates and develops a low academic self-concept), it is often proposed that teachers should adopt an individualized frame of reference when giving feedback to students.

We thus investigated whether the BFLPE on students' academic self-concept is moderated by teachers' frame of reference. For this purpose, two different methods for the analysis of group composition effects were used and compared.

Participants were 598 students from 40 Grade 6 classes. Data were analyzed using a latent-manifest contextual model within a multilevel structural equation modeling framework and the Group Actor-Partner Interdependence Model (GAPIM). Both methods supported the BFLPE. Class-average achievement was negatively associated with individual academic self-concept, even after controlling for individual achievement. Furthermore, teachers' individualized frame of reference had a small positive effect on students' academic self-concept, and diminished to some extent the BFLPE.

The results suggest that teachers' individualized feedback may be associated with an improvement of students' self-concept, and may contribute to less negative social comparison effects among classmates. Benefits and drawbacks of both methods of analysis used will be discussed.

Session F 20

30 August 2017 15:45 - 17:15

Invited Symposium

Assessment and Evaluation, Educational Policy and Systems

Challenges in school improvement research in a multilevel context

Keywords: Assessment methods and tools, Communities of learners, Comparative studies, Cooperative / collaborative learning, Meta-analysis, Mixed-method research, Qualitative methods, Quantitative methods, Quasi-experimental research

Interest group: SIG 23 - Educational Evaluation, Accountability and School Improvement

Chairperson: Katharina Maag Merki, University of Zurich, Switzerland

Organiser: Katharina Maag Merki, University of Zurich, Switzerland

Organiser: Tobias Feldhoff, Johannes Gutenberg University of Mainz, Germany

Organiser: Arnoud Oude Groote Beverborg, Johannes Gutenberg University of Mainz, Germany

Organiser: Falk Radisch, Germany

Discussant: Melanie Ehren, United Kingdom

Research on school improvement is complex, emerging from the interplay between its (loosely coupled) parts, the complex interrelationship between the several actors and the multilevel structure of educational systems which is even more important if accountability and evaluation systems differ between countries. Accordingly, analysis of this process places high demands on a study's design and method. However, current research seems relatively limited and serious research gaps can be identified. Particularly, these research gaps are owed to severe methodological shortcomings: For instance, researchers have mostly used self-reports. Further, as only very few longitudinal studies are available, school improvement changes are not studied in-depth. Therefore, this symposium seeks to host discussion of challenges in school improvement research and of different methodological approaches that have the potential to foster school improvement research. Tobias Feldhoff and Falk Radisch will discuss challenges and requirements in school improvement research based on a systematic review of quantitative longitudinal studies. Focusing on professional communities (PC) in 36 countries, Catalina Lomos will analyze different methods to test for measurement invariance and their impact on relationships of PC with other school processes. The mixed methods case study of Bénédicte Vanblaere and Geert Devos aim at analyzing the impact of a school-specific innovation on teachers' collaboration and learning outcomes, depending on the professional learning community level. And finally, Arnoud Oude Groote Beverborg and colleagues use log data from teachers to understand how teachers learn professionally in the workplace and how their development interplays with the change capacity of schools.

Challenges and requirements in school improvement research

Presenting Author: Tobias Feldhoff, Johannes Gutenberg University of Mainz, Germany; **Co-Author:** Falk Radisch, Universität Rostock, Germany

To reach a better understanding of the relation between school improvement capacity, teaching and student outcomes and to broaden our knowledge base, we need studies that appropriately model the complexity of school improvement, which use complex designs and methods of analyses. The choice of designs and methods has an influence on the insights that are possible. Therefore, this paper is elaborating methodological challenges and requirements in school improvement research based on a systematic review of quantitative longitudinal studies in current school improvement research (Feldhoff, Radisch & Bischof 2016). We developed a framework of the complex nature of school improvement processes described by six characteristics that guided our analysis. Taken together, across all 13 studies we found that none addressed all the characteristics of complexity outlined as standard. We especially need further research on the dynamic interaction of the factors in building school' capacity to change and on the reciprocal interactions between schools' capacity to change, teaching quality and student outcomes as well as their change. All in all the paper shows the necessity and the potential of longitudinal studies for further school improvement research.

Exploring processes and outcomes through a mixed methods design

Presenting Author: Geert Devos, Ghent University, Belgium; **Co-Author:** Benedicte Vanblaere, Ghent University, Belgium

Developing professional learning communities (PLCs) appears to be a promising avenue for building capacity for sustainable improvement. This mixed methods study first classifies Flemish primary schools into clusters, based on the strength of three interpersonal PLC characteristics. This reveals that four clusters can be distinguished. The case study method is then used to contrast the collaboration and resulting learning outcomes about a school-specific innovation in four schools belonging to two extreme clusters. Experienced teachers in these schools completed four logs that reveal differences in type and content of the collaboration throughout the school year between the high and low PLC schools. Results nurture optimism about the learning potential in high PLC schools as their learning outcomes are diverse. The content of the outcomes shows both differences and similarities compared to the low PLC schools.

Diversity in learning trajectories. Towards a tangible conceptualization of dynamic processes

Presenting Author: Arnoud Oude Groote Beverborg, Johannes Gutenberg University of Mainz, Germany; **Co-Author:** John Geerlings, Utrecht University, Netherlands; **Co-Author:** Peter Slegers, BMC Advies, Netherlands; **Co-Author:** Tobias

Feldhoff, Johannes Gutenberg University of Mainz, Germany; **Co-Author:**Klaas van Veen, University of Groningen, Netherlands; **Co-Author:**Maarten Wijnants, Radboud University Nijmegen, Netherlands

Knowledge of which information teachers use in their sensemaking processes and how these culminate in competences is limited, but necessary to understand how teachers learn professionally in the workplace and how their development interplays with the change capacity of schools. This study aims at enriching the dynamic conceptualisation of these ongoing and situated processes, which in a previous study using a dynamic systems analysis were characterized by effort, intentionality, and sensitivity. For that purpose, log data have been coded along competence categories and subsequently learning sequences were constructed. Measures thereof were compared between two teams. The results point to the diversity in paths to develop knowledge and skills, but also to the restraints that types of tasks (of teams) bring with them. The hypothesis that can be distilled from this study, is that the contribution of teachers to the change capacity of their schools is accordingly divers and modest. The application of this type of study for future school improvement research will be discussed.

The importance of measurement equivalence for predictor models across countries

Presenting Author:Catalina Lomos, LISER - Luxembourg Institute for Socio Economic Research, Luxembourg

This presentation will consider the latent concept of teacher Professional Community (PC) using the large-scale assessment data of International Civic and Citizenship Study (ICCS 2009) and perceived teacher participation in professional communities within schools of more than 58,000 teachers from 36 countries around the world. Using this latent concept measured through five observed items, we will reflect on the importance of comparable measurements across countries, we will empirically test for measurement invariance, and show how much the countries' PC scores and score differences are impacted by the different methods of measurement equivalence testing. In addition, the presentation will also show what is the relationship of PC with other school processes, such as distributed leadership, across the 36 countries, and most importantly how and how much are these relationships impacted by the level of measurement equivalence established across countries and the method through which equivalence is established. The topic of measurement equivalence needs to receive more attention within comparative school effectiveness and school improvement research, especially when we aim to establish valid models of predictors and relationships across more groups or countries.

Session F 21

30 August 2017 15:45 - 17:15

Invited Symposium

Factors Fostering Metacognitive Monitoring and Control

Keywords: Educational Psychology, Experimental studies, Informal learning, Metacognition, Reading comprehension, Science education, Self-regulation

Interest group: SIG 16 - Metacognition

Chairperson: Elisabeth Pieger, Germany

Organiser: Elisabeth Pieger, Germany

Organiser: Mariette van Loon, University of Bern, Switzerland

Discussant: Philip Winne, Simon Fraser University, Canada

In this symposium, we present and discuss research on factors that foster metacognitive monitoring and control. Research shows that monitoring is often inaccurate, and this is disadvantageous for control and performance. To foster metacognition and performance in educational settings, it is important to know which factors affect monitoring and control. The four papers of this symposium examine different factors affecting monitoring and control: Factors that can be implemented into learning materials (disfluency and conceptual difficulty) as well as factors that can assist learning processes (internet access, feedback, and reward). The research investigated metacognition in kindergartners, adolescents, and adults. Metacognitive processes were investigated at different learning stages: The papers address ease of learning judgments at early learning stages, performance predictions during the learning tasks, and postdictions and self-reward judgments after completing task items. These judgments were considered in different learning contexts (learning with or without digital media) and for different learning materials (texts, word-pairs, explanatory questions, and analogical reasoning tasks). The first three studies focused on monitoring; findings show that judgments may benefit from disfluency manipulations and performance feedback. Furthermore, internet access can affect judgments. The last study focused on control of learning and shows that learners are sensitive to item difficulty and reward, but that it is difficult for them to combine these two factors when controlling learning. These insights can give input to the discussion how to develop instructions that can be applied to educational practice.

Analytic monitoring and disfluency: The role of fluency-contrasts

Presenting Author:Elisabeth Pieger, Technical University of Munich (TUM), Germany; **Co-Author:**Christoph Mengelkamp, University of Würzburg, Germany; **Co-Author:**Maria Bannert, Technical University of Munich (TUM), Germany

Monitoring is essential in educational contexts: If students monitor learning in an analytic way, they can initiate adequate

control and thus improve performance. The aim of this study is to investigate if disfluency activates analytic monitoring and if fluency-contrasts moderate the effects of disfluency on monitoring and performance. Based on prior research, we expected fluency-effects (differences between fluent and disfluent material) when a fluent text is presented before a disfluent text (contrast fluent-disfluent). Inversely, when a disfluent text is presented before a fluent text (contrast disfluent-fluent), no fluency-effects on monitoring and performance are expected. To test these hypotheses, students learned first with a disfluent and afterwards a fluent text or inversely (type of contrast as a between manipulation). In Experiment 1, fluency was manipulated by letter deletion, and in Experiment 2, fluency was manipulated by font type (fluency as a within manipulation). In order to capture monitoring, students made different types of judgments during learning. Results from both Experiments show that students made equal judgments for the fluent and the disfluent text when they experienced contrast disfluent-fluent. Inversely, students who experienced contrast fluent-disfluent made lower judgments for the disfluent than for the fluent text in both Experiments. Similarly, lower performance for the disfluent than for the fluent text was found only for contrast fluent-disfluent but not for contrast disfluent-fluent. Thus, students' monitoring as well as their performance is moderated by the type of contrast in fluency. To foster monitoring in educational settings further moderators of metacognitive processes should be investigated.

Feedback Improves Kindergartners' Self-Monitoring and Self-Rewarding

Presenting Author: Mariette van Loon, University of Bern, Switzerland; **Co-Author:** Claudia Roebers, University of Bern, Switzerland, Switzerland

Young children have problems accurately monitoring their performance; they are typically overconfident and not aware of errors. This is disadvantageous for their learning. The present study aimed to investigate whether two types of feedback, performance feedback and metacognitive feedback, may be suitable to improve kindergartners' monitoring accuracy and self-rewards. Kindergartners ($n = 105$, mean age 5.8 years) completed six analogical reasoning tasks, made monitoring judgments (indicating for each item whether they thought their response was correct or incorrect), and then gave themselves reward points for each completed task (indicating how many gold coins they deserved for their performance). Children were randomly assigned to performance feedback (PF), metacognitive feedback (MF), and no-feedback (NF) groups. Results show that kindergartners were overconfident, and did not recognize most of their errors. Importantly, feedback improved self-monitoring and self-reward judgments in comparison to the NF control group. The children who received PF or MF were better able to recognize their errors, and PF was most effective to improve kindergartners' self-rewarding. Findings indicate that feedback, and especially PF can improve monitoring accuracy, error detection, and realism of self-rewarding in the pre-school context.

Does access to the Internet foster or bias metacognitive judgments?

Presenting Author: Stephanie Pieschl, University of Newcastle, Australia

It is an open question if access to the Internet fosters or biases (meta-) cognitive functioning. For example, Fischer, Goddu, and Keil (2015) showed that Internet access in one task caused higher knowledge estimates regarding a second unrelated task. This experiment replicates and extends this research. In a 2×2 between-subject experiment participants ($n = 184$) were assigned Internet or no Internet conditions in each of two phases. In phase 1, they metacognitively judged their ability to answer four explanatory questions. In phase 2, they metacognitively judged their ability to answer questions regarding six unrelated themes, predicted their ability to answer eighteen questions within these themes, answered two of these questions, and postdicted their performance. Contrary to previous finding, the results show that Internet access hardly affected metacognitive judgments on subsequent unrelated tasks. Phase 1 Internet participants only judged their ability to answer explanatory questions higher than no Internet participants in phase 1; phase 2 Internet participants only gave higher metacognitive judgments regarding phase 2; there was only one significant interaction. Participants' open answers have not yet been fully analyzed. Thus, results regarding performance and accuracy of metacognitive judgments are still pending. This experiment will contribute to the discussion regarding the (positive or negative) effects of digitalization on metacognition. For example, the results may be relevant for Internet users' motivation to participate in formal learning opportunities provided by schools and universities.

Self-Regulated Learning and Agenda-Setting: How Difficulty and Reward Affect Study Decisions

Presenting Author: Anique de Bruin, Maastricht University, Netherlands; **Co-Author:** Luciana Falbo, Maastricht University, Netherlands; **Co-Author:** Peter Stiers, Maastricht University, The Netherlands, Netherlands; **Co-Author:** Tamara Van Gog, Utrecht University, Netherlands

How do students select what information to study and what to skip? Self-regulated learning requires continuous decision making, including being able to selectively pay attention to the most important information to learn (Bjorn, Dunlosky, & Kornell, 2013; Pintrich, 2004). Most research and theory development in this field has looked at the effect of difficulty of to be learned information (e.g., Dunlosky & Hertzog, 1998; Metcalfe, 2002). More recently, research has shown that students develop an agenda when deciding how to allocate study time, with the goal to maximize results with the adequate effort. Besides task difficulty, this agenda takes into account other factors, such as the reward structure of the task. How students balance these factors when making decisions on what to learn versus what to skip is a question for empirical research. In the present study, we investigated how adolescents (12-13 years and 16-17 years) take into account task difficulty and reward when making study decisions. After deciding to be tested or not on easy or hard word pairs, given either low or high reward, students actually studied the word pairs and were later tested on all of them. Our results show that both age groups

took into account difficulty and reward separately, but could not combine the two. The lower error rate on word pairs labelled difficult but in fact easy shows that students translated their agenda setting effectively into studying.

Invited Symposium

Interaction-based interventions that transform learning: engaging in research with social impact

Keywords: Argumentation, Cognitive development, Cognitive skills, Collaborative Learning, Conversation / Discourse analysis, Design based research, E-learning / Online learning, Emotion and affect, Interdisciplinary, Literacy, Peer interaction, Reading comprehension, Reasoning, Social aspects of learning and teaching, Social interaction, Teacher Professional Development

Interest group:

Chairperson: Sandra Racionero Plaza, Spain

Chairperson: Ester Miquel, Autonomous University of Barcelona, Spain

Organiser: Rocio Garcia-Carrion, University of Deusto, Spain

Discussant: Auli Toom, University of Helsinki, Finland

This symposium presents multidisciplinary work on the use of language, dialogue and interaction to create effective and transformative learning environments across educational contexts. Organised by the Multidisciplinary Educational Research Association (AMIE), it brings together scholars who engage in research with social impact. Currently, social impact of research has emerged as one of the most pressing demands to all scientific fields; consequently, this symposium aims at addressing that challenge by discussing interactions-based interventions that provide effective solutions for learning and development. Particularly, the four papers aim at improving students learning and fostering social and emotional development from primary to higher education by (1) promoting a dialogic space with primary-aged students who worked in pairs in face-to-face and in groups through wiki technology to learn in a science project; (2) fostering a Peer Learning Network among in-service teachers who implement *Reading in Pairs*, a peer-tutoring educational programme to improve reading comprehension; (3) analysing the impact of two dialogic learning environments, named Interactive Groups and Dialogic Literary Gatherings, on learning gains and prosocial behaviour (4) examining how specially-designed dialogue and reading, might affect or change autobiographical memory, particularly emotional memories. This symposium acknowledges the research conducted in the last decades on language, dialogue and social interaction and, through the analysis of three classroom-based interventions and one experimental condition, it presents evidence on how language, reflection, and dialogic interaction can be fostered to transform learning and memory for better development.

Characterizing learning to learn together skills with web 2.0 technology

Presenting Author: Manoli Pifarré Turmo, University of Lleida, Spain; **Co-Author:** Li Li, University of Exeter, China

This article develops our understanding of "Learning to Learn together (L2L2) skills" with technology and their role to promote learning and development in primary education. To this end, our paper is grounded on literature review of previous research to identify distributed leadership, group reflection, group assessment and mutual engagement as valuable L2L2 skills to learn in the digital age. To situate this discussion and examine how L2L2 skills emerge in practice, our work continues by reporting on an empirical study with primary-aged students. They worked in pairs through face-to-face interaction using wiki and besides they interact through wiki with two other pairs to write a joint science text. In order to align pedagogy and technology affordances to promote L2L2, our wiki project used "Thinking Together" approach to support students to create a 'dialogic space' to develop L2L2 skills and co-construct new understanding in the wiki science project. Our results illustrate how the interaction around wiki can afford students to be engaged in dialogues that promote the emergence of the four L2L2 skills. Main features of each L2L2 are exemplified. Educational implications about how teaching can support the developing of L2L2 skills using web 2.0 technologies are presented and discussed.

Teacher collaboration as a central axis of the staff-development model Peer Learning Network

Presenting Author: Ester Miquel, Autonomous University of Barcelona, Spain; **Co-Author:** David Duran Gisbert, Universitat Autònoma de Barcelona, Spain; **Co-Author:** Marta Flores, UAB Universitat Autònoma de Barcelona, Spain

This paper presents research that describes an in-service teachers' staff-development model, *Peer Learning Network (PLN)* and shows results on its efficiency. *PLN* is a three-year cycle of training, aimed at helping schools involved in the network to incorporate *Reading in Pairs*, a peer-tutoring educational programme to improve reading comprehension. Results from twenty schools from one network in Spain show the effects on the achievement of students' learning, on teacher learning in both concepts and attitudes, on the decisions that teachers make to adjust the programme to their particular context, and on the supports needed for success. This staff-development model has been shown to be an effective and efficient way to help teachers introduce and use, in a sustained way, a method of cooperative learning in their classrooms. *PLN* promotes three levels of peer learning simultaneously (among students, teachers, and schools), however, teacher collaboration is the central axis to make it work

Exploring the impact of Reading and Sharing upon Autobiographical and Emotional Memory

Presenting Author:Sandra Racionero Plaza, Loyola University Andalucia, Spain; **Co-Author:**Leire Ugalde, UPV/EHU, Spain; **Co-Author:**Lidia Puigvert, University of Cambridge, UK, Spain; **Co-Author:**Carmen Martín-Gómez, Universidad Loyola Andalucía, Spain

Among the causes for gender violence among youth, research has shown a link between attraction and violence that is learned through socialization. Once violent intimate relationships have been experienced, memories of those –with their associated emotions- become the ground to perceive next intimate experiences, and make decisions accordingly. Nonetheless, the fact that autobiographical memories are malleable opens up a window into a new area of scientific inquiry and intervention from where to prevent gender violence among youth. Starting from the relevance of social experience in the reconstruction of memories, we examined in a sample of Spanish female college students ($n = 32$, age range 17-30) whether reading a scientific text on love (Gómez, 2015), which empties violence of attractiveness, modified the autobiographical memories of violent sexual-affective relationships, towards rejection. This was compared with a control group ($n = 31$, age range 17-30) upon which none intervention was applied. Memory reports were collected before and after the reading and coded to analyze their emotional content. Memory quality features were assessed with a memory quality questionnaire (Alea & Bluck, 2007). Compared to controls, the experimental group experimented a significant increase in critical memories after the reading, as well as average decrease in positive emotions and average increase in negative emotions, together with higher memory sharing. This did not occur in the controls. The results are discussed in terms of the role of certain language and interaction experiences upon autobiographical memory reconstruction, and the power of this for preventing gender violence in secondary schools.

Impact of Interactive Groups & Dialogic Literary Gatherings on learning gains & prosocial behaviour

Presenting Author:Rocio Garcia-Carrion, University of Deusto, Spain; **Co-Author:**M. Lourdes Villardón, Universidad de Deusto, Spain; **Co-Author:**Zoe Martínez-de-la-Hidalga, University of Deusto, Spain

European research under the 6th and 7th Framework Programmes (INCLUD-ED, 2006-2011; ChiPE, 2013-2015) identified a number of 'Successful Educational Actions' (SEAs) which have resulted in school success in many diverse contexts, and may contain universal and transferable components. Two SEAs, Dialogic Literary Gatherings (DLG) and Interactive Groups (IG), typically create dialogic learning environments –in a whole-class setting or in small groups- and bring family and community members into classrooms to support children's learning. This paper aims at analysing the mechanisms – promoted by DLG and IG- in teaching and learning that can achieve simultaneous success both in linguistic and mathematical competence, exploring the impact that each of these actions, have upon each other. Besides, we seek to unveil the extent to what these improvements are achieved while increasing prosocial behaviour. A quasi-experimental process-product study with training and implementation phases has been conducted in three schools in Spain. Quantitative and qualitative data, including pre- and post- testing of students' mathematical and reading comprehension, and prosocial behavior, have been collected. Initial and final interviews with intervention teachers and children have been carried out. Preliminary analysis of the pre-post assessments on reading comprehension revealed an improvement on children's level after 10 sessions of DLG.

Session F 23

30 August 2017 15:45 - 17:15

Main Building C - C5

Invited Symposium

Assessment and Evaluation, Higher Education, Learning and Instructional Technology, Learning and Social Interaction, Lifelong Learning

The Learning Sciences: Topics and Trends in Theory, Research and Methods

Keywords: Computer-supported collaborative learning, Content analysis, Design based research, Inquiry learning, Interdisciplinary, Knowledge creation, Learning approaches, Motivation and emotion, Psychometrics, Qualitative methods, Quantitative methods, Social aspects of learning and teaching, Social interaction, Teaching / instruction, Teaching approaches, Technology, Video analysis

Interest group: SIG 04 - Higher Education, SIG 10 - Social Interaction in Learning and Instruction, SIG 14 - Learning and Professional Development, SIG 17 - Methods in Learning Research, SIG 25 - Educational Theory

Chairperson: Susan Goldman, University of Illinois at Chicago, United States

Discussant: Kimberley Gomez, University of California, Los Angeles, United States

The session serves to introduce the EARLI audience to recent advances and trends in the field of the Learning Sciences. The Learning Sciences (LS) has rapidly established itself in higher education with currently more than 50 post graduate degree programs dedicated to LS worldwide and more than 700 individual scholars who are members of the International Society of the Learning Sciences (ISLS). Many more programs in education and psychology include specializations or modules in Learning Sciences.

The presentations focus on advances in research in the learning sciences drawing on the structure and content of the new *International Handbook of the Learning Sciences*, edited by Frank Fischer, Cindy Hmelo-Silver, Susan R Goldman, and Peter Reimann. The handbook offers an internationally oriented up-to-date resource for research and teaching in the interdisciplinary field of the Learning Sciences. The content is organized according to three dimensions: Processes and

mechanism of learning and interaction; The design of learning environments for complex learning; and Methods and analytical strategies for research in the Learning Sciences. A fourth presentation describes an initiative to link existing Learning Sciences programs on the master's and doctoral level worldwide, the Network of Academic Learning Sciences programs (NAPLeS). The presentation includes an analysis of what is taught in programs that claim to teach "the Learning Sciences". The discussion considers communication strategies for connecting advances and trends emanating from research in the learning sciences to the worlds of educational practitioners and policy makers.

Advances in research on processes and mechanisms of learning and interaction

Presenting Author:Susan Goldman, University of Illinois at Chicago, United States

As a field, the Learning Sciences draws on multiple disciplines and domains of research and scholarship. This presentation reflects advances in findings to date and directions for future research among the diverse perspectives and fields of work that are concerned with human learning in complex environments (i.e., authentic environments in contrast to laboratory situations), both formal and informal. Included in the discussion are cognitive, sociocultural and neurocognitive, embodied (grounded) cognition, and complex systems perspectives on learning. As well trends are reported for work on expertise and learning progressions for learning and problem solving with multiple and multimedia information resources, situated in different disciplines. Finally, attention is drawn to contemporary conceptions of metacognition and regulation of learning, epistemic cognition, motivation and engagement, and individual and collective knowledge building. Throughout, major emphasis is on the intersections of these trends with issues and concerns of the learning sciences.

Advances in research on the Design of learning environments for complex learning

Presenting Author:Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

Learning Sciences research has been focusing on approaches to supporting learning through the design of complex learning environments in formal and informal settings for learners across the lifespan. Consistent with the emphasis in the Learning Sciences there is a focus on pedagogies for complex and robust learning and on ways to support these pedagogies with technology. This contribution will include an analysis of the recent concepts, approaches and findings in the field of Computer-Supported Collaborative Learning. Here, the phenomena addressed range from dyads that solve a physics problem together with the support of computer tools to mass collaboration in Wikipedia or in big online courses like MOOCs. Moreover, this contribution covers exemplary advances in approaches to supporting active learning, including apprenticeship learning, inquiry learning, example-based learning, scaffolding, learning in the workplace, mobile computer support for collaborative learning, learning from productive failure. As well, pedagogy for supporting simulation and modeling, and instructional design using the 4C/ID framework are discussed. Trends for the future are presented for several key areas.

Research Methods and Analytic Strategies

Presenting Author:Louis Gomez, University of California, Los Angeles, United States; **Co-Author:**James Pellegrino, University of Illinois at Chicago, United States; **Co-Author:**Peter Reimann, University of Sydney, Australia

Given the array of perspectives, contexts, and topics of research in the Learning Sciences, researchers rely on multiple methodologies and analytic strategies. This presentation covers both different types of qualitative research approaches as well as basic and more advanced quantitative methods for the measurement of learning and change. Included are mixed methods and approaches to design-based research and design-based implementation research, both of which are considered relatively unique methodological characteristics of the Learning Sciences. The presentation also discusses ways in which multiple perspectives and multivocality are considered in analyzing interactions, and how these intersect with more traditional conversation and ethnographic methods for interactional analyses. Increasingly, the Learning Sciences is calling on various physiological and behavioral measures as well as contemporary approaches to assessment for learning, statistical methods for multilevel and mixed model analyses, and learning analytics as situated in the technologies of the Learning Sciences.

Advances and trends in teaching the Learning Sciences

Presenting Author:Freydis Vogel, Technical University of Munich (TUM), Germany; **Co-Author:**Daniel Sommerhoff, Ludwig-Maximilians-Universität (LMU), Germany

The Network of Academic Programs in the Learning Sciences (NAPLeS) is an international network of PhD and Master's programs in the Learning Sciences. Founded in 2012 by members of the ISLS, a main goal is to support new and emerging Learning Sciences programs all over the world by making available syllabi and learning resources used in established programs. Currently, programs from over 30 universities are NAPLeS members. Over the past several years, NAPLeS sponsored a series of online webinars. The success of these spawned the creation of short videos and interviews with more than 50 leading Learning Scientists. Both the webinars and videos are available thru the NAPLeS website (<http://naples.isls.org>). This presentation describes the NAPLeS network and the available resources.

In the second part of the presentation, results from a recent study on the trends in teaching the Learning Sciences will be presented. The goal of the study was to identify the topics and methods that currently constitute Learning Sciences programs internationally and contrast them. Preliminary results of this analysis show a great diversity regarding methods, topics and disciplines involved in teaching the Learning Sciences programs. Yet, three topics consistently appear across the range of programs in the Learning Sciences: Technology Enhanced Learning, Designing Learning Environments, and

Cognition and Metacognition. Furthermore, design-based research emerges as the prevalent method. The most common disciplines reflected in Learning Sciences programs are Computer Science, Psychology and Engineering (in that order).

Do teachers like to read? Profiles of pre-service teachers' reading attitudes

Keywords: Attitudes and beliefs, Competencies, Higher education, Pre-service teacher education

Presenting Author: Iris Vansteelandt, AP University College/Ghent University, Belgium; **Co-Author:** Suzanne E. Mol, Leiden University, Netherlands; **Co-Author:** Hilde Van Keer, Ghent University, Belgium

This study examined the evolution of the affective and conative reading attitudes, reading behaviour, and perceived reading competence of pre-service teachers from the time of enrollment in teacher education ($N=253$) until their graduation ($N=67$, who graduated within the three years of teacher education). Three attitude profiles were identified using cluster analysis; i.e. personally-oriented, socially-oriented, and low-affect readers. Preliminary analyses show that at time of enrollment personally-oriented readers (26.9%) appear to be the more solitary readers, whereas socially-oriented readers (33.6%) were most willing to interact with others about reading. Both profiles are comparable as to the pre-service teachers' reading frequency and self-competence beliefs. The low-affect readers (39.5%) seem the most reluctant and aliterate readers. At graduation, all profiles remained, however, low-affect readers show to have become less reluctant and aliterate, while personally-oriented readers show to have grown more socially-oriented. This study stresses the importance of acknowledging individual differences in reading attitude when designing teacher education courses aiming at providing all teachers with the tools and willingness to foster their students' reading proficiency and enthusiasm.

Teachers and Game-based Pedagogy: Meaningful Implementations and Necessary Competences

Keywords: Educational Technology, Game-based learning, Primary education, Teacher Professional Development

Presenting Author: Marjaana Kangas, University of Lapland, Finland; **Co-Author:** Tuula Nousiainen, University of Jyväskylä, Finland; **Co-Author:** Jenni Rikala, University of Jyväskylä, Finland; **Co-Author:** Mikko Vesisenaho, University of Jyväskylä, Finland

In this paper, we examine different types of game-based pedagogy in the context of basic education and the teacher competences necessary for the meaningful implementation of game-based learning processes. Our data comes from 15 schools participating in a development project focusing on game-based pedagogy between 2013 and 2016. Educational games was the most common type of game-based pedagogy but the use of gamification started to spread more broadly in the course of the project. In terms of teacher competences, we identified references to four main areas: pedagogical (planning and organization based on curriculum, tutoring, and assessment), technological (selecting and combining tools in meaningful ways, overcoming technology-related obstacles), collaborative (sharing and communication), and personal - including the teacher's engagement in game-related practices and improvisation (playfulness, willingness to experiment). The results are applicable for acknowledging competence areas needed in game-based pedagogy and for developing teacher education and in-service programs as teacher competencies on game-based learning will become a more integral part of the repertoire of teachers' professional knowledge and skills.

Promoting Primary School Teachers Assessment Competence via a Training Program Combined with Diaries

Keywords: Competencies, Educational Psychology, Primary education, Teacher Professional Development

Presenting Author: Julia Klug, University of Vienna, Austria

Assessment is one of teachers' key competences. So far, teachers' judgment accuracy has often been investigated (e.g., Spinath, 2005; Südkamp, Kaiser, & Möller, 2012). Since there is a call for further education programs to foster new facets of teachers' assessment competence, the aim of the present study was to adapt and test a training program including a diary for reflecting one's assessment behavior at school with primary school teachers. The program and diary have first been developed and evaluated with secondary school teachers (Klug, Gerich, & Schmitz, accepted for publication). The results should now be replicated and generalized for the group of Primary School teachers. Furthermore, the study was ameliorated by adding a follow-up test in order to see if effects are stable. $N=49$ primary school teachers participated in the study which combined pre-, post- and follow up test measures with time-series data. Results show that the training and diary in fact enhance primary school teachers' assessment competence as well as their knowledge and reflected experience compared to a waiting control group similar to the study with secondary school teachers. Effects are stable over

time. The additional standardized diary proved to be a useful tool to get insights into what teachers' implemented in their daily assessment business. It can be used as a measure to check for implementation fidelity as well as for stimulating reflection about assessment practices even if we cannot show an additional intervention effect above and beyond the effect of the training program.

DUAL VET in Spain: current situation and attitudes of VET teachers towards dual VET

Keywords: Communities of practice, Teacher Effectiveness, Teaching approaches, Vocational education

Presenting Author: Pilar Pineda, Universitat Autònoma de Barcelona, Spain; **Co-Author:** Laura Arnau-Sabatés, UAB Universitat Autònoma de Barcelona, Spain; **Co-Author:** Anna Ciraso, Universitat Autònoma de Barcelona, Italy

This paper aims to analyse the perspective of VET Spanish teachers concerning the barriers and facilitators of dual VET and its implementation in Spanish schools. The study also seeks to better understand the teacher's attitudes towards dual VET.

A validated questionnaire was used and applied to a representative sample of VET schools across 5 different regions in Spain. The source of information was the professionals who manage VET: VET coordinators and teachers. The sample consists of 322 centers.

At the moment the fieldwork is being done, which will end in December 2016. The study ends in April 2017. By this date we will have all the results for the presentation at the conference in August 2017.

Session G 2

31 August 2017 08:30 - 10:00

Chairperson: David Bergin, University of Missouri/Columbia, United States

Is truancy contagious? Context effects of schools with a high proportion of truant students

Keywords: Achievement, At-risk students, Educational policy, Quantitative methods

Presenting Author: Christine Saelzer, TUM School of Education, Germany; **Co-Author:** Andrea B. Erzinger, University of Teacher Education St.Gallen, Switzerland

This study uses data from a repeated measurement of the German PISA 2012 grade-based sample ($n = 4100$ students in 247 grade 10 classrooms) in order to investigate how the classroom context can affect adolescent truancy. Research questions were whether the proportion of truant students per class is related to the individual student's self-reported truancy and whether there are groups of students who start playing truant in the year after the PISA test. Measures include data on subject-specific and general truancy at the time of PISA 2012 and one year later as well as proficiency scores for reading, mathematics and science in both PISA 2012 and the repeated measurement one year after. Specific focus is set on identifying disadvantaged schools with regard to a high proportion of truant students. Given that in Germany, only 5 percent of students indicated to have skipped classes in PISA 2012, a school in our study is defined as disadvantaged when it has a truancy rate of more than 10 percent. Multilevel analyses indicate that there is indeed a positive relationship between the proportion of truant students in a classroom and the individual self-report on truant behavior. Furthermore, students who scored below average in PISA 2012 have a higher probability to start playing truant in the year after than students who scored at least an average level of competence. Students in disadvantaged schools according to our definition score significantly lower than students in other schools (between 10 and 25 points in Reading, Mathematics and Science).

The effects of grade retention

Keywords: Achievement, At-risk students, Quantitative methods, Social aspects of learning and teaching

Presenting Author: Barbara Drechsel, University of Bamberg, Germany; **Co-Author:** Christine Saelzer, TUM School of Education, Germany; **Co-Author:** Marcus Pietsch, Leuphana Universität Lüneburg, Germany; **Co-Author:** Katharina M. Müller, Leuphana Universität Lüneburg, Germany; **Co-Author:** Timo Ehmke, Leuphana Universität Lüneburg, Germany

This study investigates possible effects of grade retention on the development of students' mathematics competence and on their motivation and beliefs in the field of mathematics. Data stem from a representative German sample of 9th graders (PISA 2012 and a repeated measurement one year later). Same-age comparisons were applied between three groups: (a) the retained students ($N = 89$), (b) a matched comparison group of promoted students ($N = 89$), and (c) the entire group of promoted students ($N = 3181$). Results show that the retained students were not able to improve their mathematics competence to the same extent as the comparison group. Regarding motivation and beliefs in the mathematics domain, the retained students show predominantly positive trends. Summarizing these empirical findings concerning the pedagogical measure of grade retention, no clearly positive effects have been found.

Supporting struggling students in Finnish basic education: Multilevel predictors of science scores

Keywords: Achievement, At-risk students, School effectiveness, Special education

Presenting Author: Mari-Paullina Vainikainen, University of Helsinki, Finland; **Co-Author:** Ninja Hienonen, University of Helsinki, Finland; **Co-Author:** Helena Thuneberg, University of Helsinki, Finland; **Co-Author:** Jarkko Hautamaki, University of Helsinki, Finland

In Finland, the weakest performers have outperformed their comparison groups in other countries in earlier PISA assessments. However, there is little empirical evidence on how the extensive support model of Finnish schools work in enhancing performance. Therefore, we used the PISA2015 data for studying the effects of adapted instruction and continuous support from the teacher on performance of students who are struggling with their science studies based on their excessive time use despite of lower-than-average performance. We controlled the differences in students' background and included school composition effects in our multilevel regression models for controlling for the effects of context where support was provided. The results of this study are applicable on the development of support structures and practices in all European countries and they serve as a baseline for further empirical analyses on the effective features of the Finnish support model.

Do socioeconomic factors outperform immigration background regarding school achievements?

Keywords: Achievement, At-risk students, Competencies, Quantitative methods

Presenting Author: Andrea B. Erzinger, University of Teacher Education St.Gallen, Switzerland; **Co-Author:** Daniela Jäger-Biela, German Institute for International Educational Research, Germany

This study focused on factors that can account for the achievement gap between immigrant and non-immigrant students in Switzerland in math, science, and reading by analyzing PISA data from 2015. Family background characteristics, speaking a language at home that differs from the language used in school, school system characteristics, residential segregation, and characteristics of the educational system are the crucial factors in this context. We conducted multilevel analyses—separately for the three different language regions in Switzerland—to test different individual and school factors for whether they could explain achievements in reading, math, and science in 15-year-old students. A high concentration of immigrant students in schools tends to increase concerns about student achievements, especially for the non-immigrants attending these schools. Furthermore, the question of how educational systems are able to serve students who speak a language at home that differs from the instructional language is very important. Knowledge about the effect of the concentration of immigrants in the school as well as the effect of the different compositional characteristics on students' performance will support decisions on system level. Because Switzerland has been handling the challenge of a high and steadily increasing rate of immigrant students in schools for several decades, it represents a benchmark for other countries where immigration is of increasing importance.

Session G 3

31 August 2017 08:30 - 10:00

Single Paper

Motivational, Social and Affective Processes, Teaching and Teacher Education

Motivation and Emotion - J

Keywords: Assessment methods and tools, Attitudes and beliefs, Educational Psychology, Mixed-method research, Motivation, Motivation and emotion, Primary education, Qualitative methods, Self-efficacy, Teacher Professional Development, Teaching / instruction

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Barbara Gasteiger-Klicpera, University of Graz, Austria

Motivation for teacher professional development: The role of decision contexts and age

Keywords: Motivation, Primary education, Qualitative methods, Teacher Professional Development

Presenting Author: Folke Glastra, Leiden University, Netherlands; **Co-Author:** Cornelis de Brabander, Leiden University, Netherlands

Using semi-structured interviews with 95 primary teachers, this study investigates the impact of three decision contexts—teacher participation is decided by school boards, by teacher teams or by individual teachers – and age group (younger/older) on teacher motivations for continuing professional development (CPD). Its focus is on valences – feelings about CPD and thoughts about the value of its consequences - of CPD and the role of autonomy in these motivations. Research questions pertain to the overall pattern of valences and autonomy, differences and similarities in these patterns according to decision context and teacher age group, and the nature of arguments connected to valences and autonomy. Teachers are generally positive about CPD and prefer directly applicable CPD, by implication limiting its uses to short term, non-innovative purposes. Decision contexts matter: Individual decision contexts have positive, board decision contexts negative valences for most teachers. School boards are perceived too distant to school practice to warrant relevancy. Team decision contexts shield most against negative valences. Decision contexts impact feelings of autonomy, and these in turn impact CPD valences. Valence and autonomy patterns differ markedly between age groups. Theoretical meaning, and

implications of these findings for teacher CPD and for further research are discussed.

Measuring multiple dimensions of early literacy motivation through self-report at school entry

Keywords: Assessment methods and tools, Attitudes and beliefs, Motivation, Motivation and emotion

Presenting Author:Erin McTigue, University of Stavanger, Norway; **Co-Author:**Oddny Judith Solheim, The Norwegian Reading Centre, Norway; **Co-Author:**Bente Walgermo, University of Stavanger, Norway; **Co-Author:**Jan Frijters, Brock University, Canada

Literacy success in school is co-determined by skill and motivation with early success in literacy predicting long term achievement. Additionally, early literacy interventions for at-risk students are more effective than later interventions. However, despite availability of measures for early reading skills few reliable and valid measures exist to measure reading motivation. In order to assess the viability of measuring students' reading motivation, at the time of school entry, in a multidimensional and theoretically grounded manner, we developed and validated the Norwegian Early Literacy Motivation Survey (NELMs). The sample comprised 1,171 first grade Norwegian students, assessed within the first month of school. Through analysis of competing factor models and grounded within a hierarchical model of motivation, the 12 survey items measured two overall dimensions: Self-beliefs and Interest. Self-beliefs was comprised of two scales: self-concept and self-efficacy; Interest was a single dimension. The structure was found to be invariant across skill level (low and high skill) and gender. Correlations between the three subscales varied considerably, but relations were supported by theory. Correlations between latent constructs and validation variables provide evidence of convergent and discriminant validity. This work adds to the field particularly by addressing a lack of affective instruments appropriate for use at school entry, in this case by measuring reading motivation prior to formal instruction in reading. Implications for use as a screening tool are discussed.

Teacher's self-efficacy as predictors of their classroom behaviours

Keywords: Attitudes and beliefs, Motivation, Self-efficacy, Teaching / instruction

Presenting Author:Sindu George, Monash University, Australia

Researchers have been interested in teachers' self-efficacy and its influence on the teaching-learning process since early 1980s (e.g., Ashton, 1984). There is a quantum of literature available highlighting teachers' self-efficacy as a significant predictor of various teacher and student outcomes. Although the volume of teacher self-efficacy research has increased, researchers are concerned about the direction, quality, and influence resulting from the increased attention given to the construct (Klassen, Tze, Betts, & Gordon, 2011). The current paper addresses one of the main issues in self-efficacy research –assessment of self-efficacy using global measures– by adopting the multi-faceted model of teachers' self-efficacy (Tschannen-Moran, Woolfolk Hoy, & Hoy, 1998). The paper presents a structural model relating the three dimensions of teachers' self-efficacy and four selected dimensions of their classroom behaviors.

Students' Beliefs Concerning School Transition to Lower Secondary School in Finland

Keywords: Educational Psychology, Mixed-method research, Primary education, Motivation and emotion

Presenting Author:Sirpa Eskelä-Haapanen, University of Jyväskylä, Finland; **Co-Author:**Kati Vasalampi, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland

The present study examines primary school students' beliefs concerning their school transition to lower secondary school. In this study the concept belief refers to students' own understanding and ideas. It can be understood as positive expectations to look for or success as well as concerns to be afraid or tensed of. Furthermore, relations between students' concerns and well-being were examined. Data from 1037 Finnish students were obtained at the end of students' primary school. The study was conducted with mixed-method approach. The results of the qualitative problem driven content analysis showed that students' had positive expectations comprising: 1. Comfort, 2. Friendships, 3. Connected to Learning, 4. School, 5. Increasing Freedom, and 6. Teacher-child relationship. Concerns instead were mainly related to social relations in lower secondary school. Furthermore, results of the independent sample t-test indicated that girls, who mentioned concerns about social relations in lower secondary school, were more exhausted and had lower level of self-esteem than the other girls at the end of primary school. In contrast, boys who had concerns about future classroom had higher level of self-esteem and a lower level of cynicism in comparison with other boys at the end of primary school.

Regulation on line during early-readers' writing: a situated model of teacher's assessment activity

Keywords: Assessment methods and tools, Distributed cognition, Qualitative methods, Writing / Literacy

Presenting Author: Lionel Dechamboux, University of Geneva, Switzerland

Interested by teacher's assessment activity during regulation on line (Mottier Lopez, 2012), we focused on his/her activity during writing tasks he/she gave to their students. This particular context led us to several problems. A conceptual one: from a situated and interpretative perspective, we'll plead the need of embracing the teacher's point of view within the situation. But how to define assessment activity in action? A methodological one: how to catch relevant data of this activity? In front of such questions, we tried to cross over assessment and activity theories through two major concepts of John Dewey's works: valuation and inquiry (Dewey, 1993 ; 2011). So we would like to answer these research questions: What is the teacher's assessment activity in the regulation on the fly process? What matters to him/her? What sorts of sign does he/she take care of? What kind of actions does it lead him/her to? To what extent a previous assessment activity shapes a next one? What sorts of framework are used by teachers to assess? To answer these questions, we'll focus on three teachers' work in three primary classrooms during writing sessions with three early-readers pupils with learning difficulties. We filmed teacher-students interactions and we made self-confrontation interview with teacher to model his/her assessment activity. Our study highlights the validity of our model of valuation and inquiry to describe teacher's assessment activity showing the building of frameworks during experience, his/her strategy used to support students learning.

Empowering teacher's assessment literacy: A study on the value of professionalization programs

Keywords: Assessment methods and tools, Competencies, Educational policy, Higher education

Presenting Author: Fer Boei, Windesheim University of Applied Sciences, Netherlands; **Co-Author:** Kitty Meijer, Utrecht University of Applied Sciences, Netherlands; **Co-Author:** Jeroen Van der Linde, Hogeschool van Arnhem en Nijmegen/HAN University, Netherlands; **Co-Author:** Fedor De Beer, Hogeschool van Arnhem en Nijmegen/HAN University, Netherlands; **Co-Author:** Dominique Sluijsmans, Zuyd University of Applied Sciences, Netherlands; **Co-Author:** Tamara Van Schild-Mol, Hogeschool van Arnhem en Nijmegen/HAN University, Netherlands

The Netherlands Association of Universities of Applied Sciences (NAUAS) agreed upon a set of demands regarding the assessment competence of higher education teachers related towards students' learning outcomes. This study evaluates the value and the alignment of these programs in relation to the intended goals after implementation. The study is characterized as a multiple case design using the model of Van den Akker (2013) as an analytic framework. The NAUAS adopted the set of demands and mainly added organizational issues in the implementation. The attained level was experienced in different ways, related with the entry levels of the teachers. Most teachers were positive about the content of the programs.

Best of two worlds in writing assessment: Integrating benchmarking and comparative judgement

Keywords: Assessment methods and tools, Competencies, Language (L1/Standard Language), Writing / Literacy

Presenting Author: Marije Lesterhuis, University of Antwerp, Belgium; **Co-Author:** Fien De Smedt, Ghent University, Belgium; **Co-Author:** Renske Bouwer, University of Antwerp, Belgium; **Co-Author:** Hilde Van Keer, Ghent University, Belgium; **Co-Author:** Sven De Maeyer, University of Antwerp, Belgium

As scores on writing performance provide students, teachers and even policy makers insights into students' writing ability, these scores should be reliable, valid and preferably also obtained in an efficient way. Although rubrics are often used in order to enhance reliability and efficiency, problems are often reported due that raters face difficulties in defining absolute scores for each text separately. Benchmark scoring and Comparative Judgement (CJ) are both based upon the idea that raters are better helped when they can compare between texts instead of compare a text with a rubric. For benchmark scoring, a scale of five benchmark texts is developed by a small number of experts. These five benchmark texts help raters in their scoring decision. Within CJ, raters decide on a high number of comparisons, each time only which texts is best. Based on these comparison decisions the texts can be scaled. Both methods have their drawbacks: developing benchmark texts requires time and expertise, while for CJ several raters are needed and this method is especially time-consuming when a high number of texts need to be scaled. The present study reports the (dis)similarities between both scoring methods by looking at the obtained reliabilities and if the texts are scaled in a similar way. Results show that both methods lead to similar reliabilities and scores. Therefore, the authors propose to do more research on how both methods can be combined.

Blind faith and unseen exams: What research has to say about the choice between seen vs unseen exams

Keywords: Assessment methods and tools, Instructional design, Meta-analysis, Misconceptions

Presenting Author: Cathal O'Siochru, Liverpool Hope University, United Kingdom; **Co-Author:** Melissa Ryan, Liverpool Hope University, United Kingdom

The significance of exams in determining both student satisfaction and success has prompted a widespread interest in the most effective way to employ exams as assessments. This has prompted several longstanding debates on the merits of different exam formats. However, it is interesting to note a relative absence of discussion on what could be argued is a major exam formatting choice, seen vs unseen exams. Many educators have reservations about seen exams based on anecdotal arguments about increased risk of plagiarism, rote memorization and other poor practices. But what evidence is

there to support or criticise either seen or unseen exam formats? In this paper we will present the findings of our review of the literature which explores the issues in and around the seen vs unseen debate. We will consider the perceptions of both staff and students on seen and unseen exams, seeking to understand the preferences on both sides and the origins of those preferences. We will also discuss research which has considered the impacts of the two exam formats, including impact on the approach used by students to prepare for their exams, impact on student self-confidence and impact on assessment outcomes such as performance. Additionally, we will discuss some of the methodological issues we've identified in our review of research methods in this area such as a potential lack of 'student voice' in the research. We hope to stimulate an informed debate among education researchers and practitioners on this somewhat overlooked issue in exam formatting.

Teaching Responsible Research and Innovation as a part of the Nature of Science

Keywords: Citizenship education, Educational policy, Reflective society, Science education

Presenting Author:Antti Laherto, University of Helsinki, Finland; **Co-Author:**Lorenz Kampschulte, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Jan Apotheker, University of Groningen, Netherlands; **Co-Author:**Miikka de Vocht, University of Helsinki, Finland; **Co-Author:**Ron Blonder, Weizmann Institute of Science, Israel; **Co-Author:**Sevil Akaygun, Bogazici University, Turkey

The European Union encourages science education to orient towards the concept of Responsible Research and Innovation (RRI), i.e. socially and ethically sensitive and inclusive processes of science and technology. Recent views of Nature of Science (NOS) – one of the most important and debated topics in science education research – address the same concerns. To examine the socio-institutional nature of science in science education, in the present theoretical study we carried out a concept analysis of educational implications of the RRI policy in relation to a recent reconceptualization of NOS, the Extended Family Resemblance Approach (FRA) for Science Education. We discuss how the nature of science in that approach closely connects to the RRI, and thereby conclude that science education for RRI can utilize the approaches and applications developed with the Extended FRA. To illustrate the opportunities and challenges RRI may bring to NOS-focused science education, we discuss the results and experiences stemming from the EU-funded project IRRESISTIBLE. We show examples of the practical classroom approaches developed in the project, as well as some survey results on teachers' perspectives on RRI. The aim of this work is to better understand the potential implications of RRI to research and practice in science education.

This is not my life: Disrupting dominant cycles of knowing/being in educational research.

Keywords: Interdisciplinary, Philosophy, Social aspects of learning and teaching, Knowledge creation

Presenting Author:Tim Corcoran, Deakin University, Australia

Acknowledging the symbiotic inseparability of ontology and epistemology encourages researchers to sense how multiple ways of being and ways of knowing affect the conduct of our work. No wonder then the dilemmas facing researchers when, for example, seeking financial support, they are confronted with funding being available largely to maintain particular ways of knowing/being. Regrettably this is not uncommon in current practice where positivist-informed randomised control trials or causal-explanatory logics are considered gold standard. How is it then possible to maintain a preferred ethics of existence (St. Pierre, Jackson & Mazzei, 2016) when prevailing cycles of knowing/being dominate educational research? This presentation considers opportunities made available in post-positivist or post-qualitative work (Lather, 2007) and new empiricism and new materialism (St. Pierre, 2014) and how these support a revelatory turn in understanding life-enacted learning (Corcoran, 2005). It then engages Shotter's (2010) interest in anticipatory responses and how carriage of these in/to educational scholarship assists with aligning commitments to joint action. This interdisciplinary discussion brings together cutting edge theory from education and psychology to examine researcher orientations to learning and social interaction and how these can support or negate ethical commitments made in/through practice.

Ask What Your Country Can Do For You: Basic Education Policies in the Welfare State

Keywords: Case studies, Educational policy, Interdisciplinary, Literacy

Presenting Author:Carolyn Knauber, German Institute for Adult Education - Leibniz Centre for Lifelong Learning, Germany;

Co-Author:Alexandra Ioannidou, German Institute for Adult Education - Leibniz Centre for Lifelong Learning, Germany

Policies on basic education are gaining importance, especially since the results of the OECD Programme for the International Assessment of Adult Competencies (PIAAC) were published. They revealed that a sizeable proportion of adults in developed countries have low basic skills. In a contemporary perspective education policy can be considered as part of welfare state policy given that the lack of basic education diminishes chances to participate in society and the economy. The effectiveness of policies on literacy and basic education has both macro- and micro-economic dimensions and thus, it is important to ask which kinds of basic education policies countries implement to address the problems of adults with low literacy skills. This empirical paper explores the potential of basic education policies in the advancement of basic skills, particularly literacy, in three exemplary country cases (Austria, England and Denmark), representing Esping-Andersen's three welfare state regimes: the conservative, the liberal and the social-democratic welfare state. Findings are based upon qualitative data from the project "EU-Alpha" gained through comparative research in six countries. The paper identifies actors, resources/responsibilities, and implementation of basic education policies and places these findings into broader debates on adult skills and skills inequality.

Independence or interdependence? Dialogue-theoretical problems of 'independent' learning

Keywords: Cultural psychology, Learning approaches, Social aspects of learning and teaching, Teaching / instruction

Presenting Author:Tina Kullenberg, Kristianstad University, Sweden; **Co-Author:**Anders Eklöf, Kristianstad University, Sweden; **Co-Author:**Lars-Erik Nilsson, Kristianstad University, Sweden

In the light of our empirical study on 12 Swedish students in secondary school, this paper elaborates on the paradoxical issue of how to conceptually, and theoretically, approach an intended self-regulating working model within a dialogical framework. Our findings indicate that the participants' reasoning about the pursued project works is basically build on the ideal notion of being dependent on their teacher in several ways. It is argued that a sociocultural perspective generally problematize the ontology of individualistic independence while stressing the idea of interpersonal and contextual *interdependence*. However, drawing on Bakhtin-influenced educational scholars, we also provide a distinction between two types of interdependency in communicative other-orientation: orientation to alterity vs. orientation to agreement-based intersubjectivity. Furthermore, we discuss the educational implications of such a conceptualization in terms of socialization and personalization. Interdependency from an individualistic point of view is dismissed as an illusion but a radical notion of ontological interdependence may instead facilitate students' voices, that is, their personalization in terms of creative agency.

Learning to mean: The transfer of grammar knowledge to the shaping of rhetorical intentions

Keywords: Mixed-method research, Primary education, Secondary education, Writing / Literacy

Presenting Author:Susan Jones, University of Exeter, United Kingdom; **Co-Author:**Debra Myhill, University of Exeter, United Kingdom; **Co-Author:**Helen Lines, University of Exeter, United Kingdom

With the re-introduction of formal grammar teaching into the UK curriculum has come a grammar test, largely testing decontextualized grammar knowledge. There is, however, little substantive research evidence demonstrating how grammar knowledge is transferred to the act of writing, nor the extent to which this transfer is explicitly understood by young writers. Within the context of a pedagogy that eschews the decontextualized 'labeling of parts' and rather, supports young writers in making a connection between grammatical choices and rhetorical effect, this paper will consider how young writers 'learn how to mean'. Drawing on case study data from a three year longitudinal study, funded by the Economic and Social Research Council, this paper will explore how four young writers developed an awareness of the role of grammar in shaping meaning, how this is reflected in what they write and how they explain their choices. The data will show that grammar knowledge and the crafting of text exists in a reciprocal relationship; such that an unconscious writing choice can become conscious grammar knowledge that can inform future writing choices.

Teachers' stories about writing: Exploring identities through autobiographical creative writing

Keywords: Arts, In-service teacher education, Teacher Professional Development, Writing / Literacy

Presenting Author:Anne Martin, University of Jyväskylä, Finland

Teachers' stories about writing: Exploring identities through autobiographical creative writing

This study examines autobiographical creative writing as a tool for promoting teachers' professional development and

identity from a narrative perspective. The purpose of the study is to explore teachers' relationship to writing and their goals regarding developing themselves in the writing group's meetings. Research questions are following: 1) 1) What kinds of stories do teachers tell about themselves as writers? 2) 2) What goals do the teachers set for their personal and professional development in the writing group? Writing is perceived to be a significant tool for professional development. According to narrative theory, we build our identities through stories we tell about ourselves. Research suggests that arts-based, autobiographical and literary methods can bring new perspectives to exploring ourselves. This qualitative study is based on a peer writing group for primary school teachers (N=11). In the group, teachers wrote autobiographical creative assignments to express and to explore themselves. They also discussed their writing experiences. The data were collected during the academic year 2016–2017, comprising of the teachers' writings, interviews and group discussions. Thematic and narrative analysis were used as research methods. According to preliminary results, the teachers perceived to have a positive relationship to writing. They perceived writing to be effective for personal and professional development, and emphasized therapeutic and pedagogical dimensions of creative writing. The findings of this study further support the idea that integrating arts-based, literary methods can broaden the narrative identity building process of teachers.

Voicing Grammatical Knowledge: Young Writers' Articulation of Grammatical Concepts

Keywords: Cognitive development, Educational attainment, Metacognition, Writing / Literacy

Presenting Author: Helen Lines, University of Exeter, United Kingdom; **Co-Author:** Debra Myhill, University of Exeter, United Kingdom; **Co-Author:** Susan Jones, University of Exeter, United Kingdom

Abstract: Changes to curriculum policy in several Anglophone countries, for example New Zealand, Australia and England, have focused attention on the explicit teaching of grammar as a tool for raising attainment in writing, with the use of linguistic terminology made prominent in both teaching and testing. Theoretically, metalinguistic understanding has been framed as the ability to talk explicitly about language, with or without the use of grammatical terminology. However, whilst acknowledging that talk is the key mechanism through which metalinguistic understanding in writing is made visible, more research attention has been paid to teachers' verbalisations of linguistic subject knowledge than to young writers' articulation of grammatical knowledge. Drawing on data from a three-year longitudinal study, funded by the Economic and Social Research Council, this paper will consider the ways in which children aged 8-14 voice their understanding of grammatical concepts, with particular reference to sentence grammar, given that achieving sentence control is a key marker of progression in writing. The paper will focus on how student talk reveals learning and can be used to assess conceptual development of grammatical knowledge.

The Inspiration Myth: how professional writers manage the planning process

Keywords: Language (L1/Standard Language), Literacy, Teaching / instruction, Teaching approaches

Presenting Author: Debra Myhill, University of Exeter, United Kingdom

Cognitive models of the writing process draw attention to three process which characterise the process of writing: planning, translating and reviewing, and these models emphasise that these processes are not chronological or linear but recursive and iterative. At the same time, many classrooms adopt process approaches to the teaching of writing, and in the UK, the curriculum advocates the teaching of planning, drafting, and evaluating. Yet there is evidence that teachers tend towards a narrow conceptualisation of planning as the formal outlining of the written text. This paper sets out to explore how professional writers, as expert writers, describe their own planning processes and how this understanding of highly competent management of writing might re-shape instructional practices in the teaching of writing to developing and less mature writers. The paper draws on data from two consecutive studies, which involved interviewing 21 professional writers about their own composing processes, including planning. The findings indicate that professional writers describe planning in ways which are consistent with cognitive models, with the planning being a fluid and varied process including a range of behaviours such as research, gestation of ideas, the adoption of personal writing routines as well as more formal outlining of text. The evidence from professional writers indicates that broadening the pedagogical conceptualisation of planning to allow more time for topic familiarisation, creative playfulness, and gestation of ideas, as well as the more formal outlining, might better support young writers in their development as writers.

What are ethics in doctoral supervision, and how do they matter?

Keywords: Doctoral education, Higher education, Quantitative methods, Researcher education

Presenting Author:Erika Löfström, University of Helsinki, Finland; **Co-Author:**Kirsi Pyhältö, University of Oulu / University of Helsinki, Finland

The purpose of this study is to provide a tool for analyzing ethical issues in doctoral supervision, to investigate whether ethical issues in doctoral supervision relate to doctoral experience, and if they do, how. More precisely, the study explored the relationships between ethical issues in doctoral supervision and attrition intentions, research engagement, satisfaction with supervision and with doctoral studies, and burnout. The respondents were 236 doctoral students in behavioral sciences in two research-intensive universities in Finland. The results show that how students are treated, supported, and respected are vital elements in how they experience their doctoral journey. Ethics in supervision as experienced by the students predicted both positive outcome variables (engagement, satisfaction with doctoral studies and supervision) and negative ones (burnout, attrition intentions). This result suggests that high standards of ethics are vital for a functional supervisory relationship.

Becoming a university teacher: doctoral students' conceptualizations of online teaching portfolios

Keywords: Doctoral education, Qualitative methods, Reflection, Researcher education

Presenting Author:Helga Dorner, Central European University, Hungary; **Co-Author:**Joanna Renc-Roe, Central European University, Hungary

This paper outlines findings from a research project on the reflective processes involved in the creation of online teaching portfolios by doctoral students of an international, graduate university in Europe. The study was conducted with the aim to identify emerging individual and shared conceptions of online teaching portfolios. Fifteen doctoral students who took part in an early-career faculty development program were interviewed. Interviews were transcribed and coded. The coding followed the protocol of qualitative interview analysis. Doctoral students were found to oscillate between performative and authentic repertoires of reflective work in their conceptions of portfolios. These findings provide a useful research insight into the way scholarly, reflective practice is experienced.

Doctoral students' engagement in knowledge creation practices

Keywords: Doctoral education, Qualitative methods, Researcher education, Knowledge creation

Presenting Author:Viivi Virtanen, University of Helsinki, Finland; **Co-Author:**Jenna Vekkalila, University of Helsinki, Finland; **Co-Author:**Jani Kukkola, University of Jyväskylä, Finland; **Co-Author:**Liezel Frick, Stellenbosch University, South Africa; **Co-Author:**Kirsi Pyhältö, University of Oulu / University of Helsinki, Finland

Knowledge creation is at the core of scientific endeavor. As early career researchers, doctoral students take part in the knowledge creation processes and through their original contribution to knowledge they are considered to become experts of their particular domain (Frick & Brodin, 2014). Yet we currently understand very little about what doctoral knowledge creation entails, and how doctoral students engage with this creative process. This study aims to gain a better understanding of the kinds of knowledge creation practices that doctoral students in the sciences engage in during their studies. For this purpose, altogether 34 doctoral students from STEM fields were interviewed. The data were collected with semi-structured interviews, and the data were qualitatively content analyzed. The preliminary results showed that the majority (63%) of the described practices were *established* everyday knowledge creation practices, whereas over a third (37%) of the practices were *innovative* entailing transformation of the current practices and developing new ones. Moreover, the practices were typically *collective* (66%) involving the students, their supervisors or other members from their researcher groups. Only about a third (34%) of the practices reported were *individual* in nature. Further investigation showed that the participants were typically *actively engaged* in knowledge creation practices (62%) rather than just *adapting* (24%) the existing ones. Perceiving oneself as *bystander* (14%) was even less typical. The significance of this study lies in exploring doctoral students' self-reported knowledge creation practices in STEM fields, and shows that they perceive themselves to be *actively* and *collaboratively* engaged in creating knowledge.

The doctorate as a quest: PhD students purposively navigating their doctoral paths

Keywords: Doctoral education, Higher education, Qualitative methods, Researcher education

Presenting Author:Isabelle Skakni, University of Oxford / Université Laval, Canada

In most Western countries, universities express concern about completion times and graduation rates at the doctorate level, especially in the social and human sciences. While intellectual abilities alone are not sufficient to successfully progress through a PhD program, current knowledge indicates that modalities of training and contexts and conditions in which this training takes place have also a major impact on the process. However, few studies examine how the interplay of individual and structural factors influence PhD students' paths. Drawing on Giddens' theory of structuration, this paper aims to address this gap by exploring how PhD students' primary 'reasons', 'motivations' and 'motives'—as defined by Giddens—for engaging in doctoral studies influence both which aspects of their training they perceive as facilitating/constraining their progress and the strategies they favoured to face the challenges encountered. Based on semi-structured interviews conducted with 36 Canadian PhD students in the social and human sciences, the findings reveal three distinct journeys regarding how these students navigate their doctoral paths: the quest of the self, the intellectual quest, and the professional quest. Depending on their quest type, the nature and intensity of PhD students' concerns and challenges as well as the support they expected during their training differed.

Enhanced Concept Learning in Kinematics by Means of Formative Assessment

Keywords: Achievement, Science education, Student learning, Teaching / instruction

Presenting Author: Andreas Lichtenberger, ETH Zurich, Switzerland; **Co-Author:** Clemens Wagner, Physics Department ETH Zurich, Switzerland; **Co-Author:** Andreas Vaterlaus, Physics department eth, Switzerland

We have developed and applied a model of formative assessment in order to foster concept knowledge in kinematics at Gymnasiums in the German speaking part of Switzerland. Our model consists of four elements: clicker sessions with peer instruction, a monitoring tool, a diagnostic tool and a reflective lesson. To investigate the effectiveness of our model we conducted a study with 29 teachers and 607 students (15 to 17 years old) from 24 Swiss Gymnasiums. Our experimental setting consisted of three groups: a control group using a traditional teaching style (TT-group), a frequent testing group (FT-group) where traditional teaching was endowed with concept questions as exercises, and the formative assessment group (FA-group) where teachers used the same set of concept questions in the formative assessment approach. In order to compare the three groups we used a validated kinematics concept test as pre-, post- and follow-up-test and a conventional kinematics test with standard numerical textbook problems as post-test. The results show that the students in the formative assessment courses achieved a significantly better conceptual understanding than the students who attended the traditional and the frequent testing courses. This indicates that the better performance was not a frequent testing effect but presumably resulted from the peer instruction and the reflective lesson. Moreover, the FA-group achieved the same results as the TT-group in the conventional test. This implies that the students in the formative assessment setting were able to outweigh the shorter exercise time with a better conceptual understanding.

Understanding Coulomb's law by means of inventing with contrasting cases

Keywords: Achievement, Science education, Student learning, Teaching / instruction

Presenting Author: Elsbeth Stern, ETH Zurich, Switzerland; **Co-Author:** Lennart Schalk, ETH Zurich, Switzerland; **Co-Author:** Ralph Schumacher, ETH Zurich, Switzerland

Learning a novel principle by inventing with contrasting cases is a promising means to support deeper understanding of abstract scientific concepts. It seems particularly worthwhile if a concept is based on a complex mathematical formula, which at the same time is not too challenging from a mathematical point of view. This is the case for Coulomb's law: the magnitude of the electrostatic force F of interaction between two point charges is directly proportional to the scalar multiplication of the magnitudes of charges ($q_1 \cdot q_2$) and inversely proportional to the square of the distance between them (r^2). In a study with 17 year old students ($N = 101$) from 5 advanced high-school classes (Gymnasium), we investigated whether students who had to invent the formula by comparing four pairs of contrasting cases would develop a deeper understanding of Coulomb's law than students who were presented with the formula and had to elaborate it by self-explanations. Two self-explanation conditions were set up as control; in both control conditions, Coulomb's law was directly introduced. In the overall condition, students subsequently saw four pairs of contrasting cases of Coulomb's law before they were prompted to generate self-explanations. In the stepwise condition, students were asked for self-explanations after every pair of contrasting cases. Contrary to our expectations, the inventing group did not outperform the other two groups neither on conceptual, nor procedural or transfer tasks.

Reflections from Research: considerations for the implementation of educational simulations

Keywords: Achievement, Science education, Student learning, Teaching / instruction

Presenting Author: Koen Veermans, University of Turku, Finland; **Co-Author:** Tomi Jaakkola, University of Turku, Finland

Educational simulations hold great potential for creating engaging and productive learning environments in STEM domains. This does, however, not mean that the implementation and outcomes of learning with educational simulations are straightforward. This paper presents and reflects on research findings in a series of studies with a computer simulation in the domain of electricity. These studies used the same simulation with varying instructional designs and over a range of grades. Interestingly, though the overall impact has been predominantly positive, each design has always had a unique influence on student performance and/or engagement. The paper will look at perceptual concreteness of simulation elements, instructional support and combining simulations with real equipment and will try to provide some interpretation for the findings. We hope the results and interpretations presented in the paper provide insights and considerations for educators utilizing simulations in practical settings.

Who speaks Physics? The importance of language competence for physics understanding

Keywords: Competencies, Educational Psychology, Reasoning, Science education

Presenting Author:Ursina Markwalder, ETH Zurich, Switzerland; **Co-Author:**Elsbeth Stern, ETH Zurich - Research on Learning and Instruction, Switzerland; **Co-Author:**Lennart Schalk, ETH Zurich - Research on Learning and Instruction, Switzerland

In natural sciences in general and in physics in particular, language competence is assumed to play a key role in learning and for conceptual understanding. Nevertheless, a strong empirical basis of this assumption is lacking. In our study, we tested 225 6th graders and assessed their cognitive ability, motivation, and language competence as predictors for physics understanding. Prior to our assessment, the elementary school students were trained on basic physic concepts. A hierarchical regression analysis shows that cognitive ability and language competence predict physics understanding. While a bivariate correlation indicates a significant relation between physics understanding and motivation, this relation diminishes when cognitive ability is simultaneously taken into account in the regression model. Language competence explained 15.5% of unique variance in physics understanding. Thus, language competence does indeed play an important role for physics understanding.

Erroneously solving multiplicative and additive word problems: A matter of preferences and abilities

Keywords: Educational Psychology, Mathematics, Primary education, Problem solving

Presenting Author:Tine Degrande, KU Leuven, Belgium; **Co-Author:**Lieven Verschaffel, KU Leuven, Belgium; **Co-Author:**Wim Van Dooren, KU Leuven, Belgium

Previous research has repeatedly shown that young children erroneously reason additively in multiplicative word problems, while older children erroneously reason multiplicatively in additive word problems. Whereas previous studies explained children's erroneous reasoning exclusively in terms of lacking multiplicative or additive reasoning abilities, the present study aimed to investigate to what extent this erroneous reasoning depends on children's *preference* for multiplicative or additive relations – in addition to lacking *abilities*. For this purpose, four test instruments (a preference test, word problem test, test measuring the procedural component of multiplicative and additive reasoning, and a test measuring the conceptual component of multiplicative and additive reasoning) were administered to 246 third, fourth, fifth and sixth graders. Results revealed that almost all children who erroneously over-used multiplicative or additive reasoning possessed the procedural skills needed to reason multiplicatively and additively, while this was not the case for the conceptual component. However, still a substantial percentage of those multiplicative and additive reasoners had acquired all necessary abilities, and almost all of them resp. had a preference for multiplicative or for additive relations. These results confirm that getting a view on children's preference is indispensable in order to fully understand the development of multiplicative and additive reasoning.

The Facilitating Role of Analogies in Understanding Scientific Texts

Keywords: Conceptual change, Misconceptions, Science education, Student learning

Presenting Author:Irini Skopeliti, University of Patras, Greece; **Co-Author:**Stella Vosniadou, National and Kapodistrian University of Athens / Flinders University of Australia, Greece

In two experiments we investigated the influence of instructional analogies in the comprehension of counter-intuitive scientific texts in elementary school children. The participants in both studies were randomly assigned to an experimental or a control group. The experimental group read a text presenting the scientific explanation of the day/night cycle (experiment 1) and of the seasons (experiment 2). The control group read the same text without the analogy. All participants gave pretest and posttest explanations of the phenomenon in question and all of them were asked to recall the information given in the text they read. The results showed that most of the explanations given at pretest were incongruous with the scientific explanation and interfered with the comprehension of texts causing invalid inferences. The children in the analogy condition showed better recall and created fewer invalid inferences compared to the children in the no-analogy condition. The children in the analogy condition also provided posttest explanations closer to the scientific explanation than the children in the no-analogy condition. The results from both studies supported the claim that analogies can facilitate the understanding of counter-intuitive information.

Models as relational categories in science education – insights from cognitive science

Keywords: Conceptual change, Physical Sciences, Science education, Model-based reasoning

Presenting Author:Tommi Kokkonen, University of Helsinki, Finland

Models and modelling have become an influential approach to science education — especially in physics. One reason for this is that models are seen as a way towards authenticity in science education. Another reason is that modelling based learning can lead to better learning outcomes with regard to conceptual knowledge as well as facilitate conceptual change. In this paper I will first look at the roles of models and modelling in science education arising from the literature. Specifically, I will argue that there are three main roles: 1) using models to convey an idea or concept, 2) constructing and revising models and 3) using models in theory development. However, despite ample research there are surprisingly few that look at the cognitive processes underlying model-based learning. However, it has been suggested that viewing models as relational categories could provide insight with regard to the learning processes. I will follow this suggestion and contrast it with the roles 2 and 3 of modelling. Most importantly, I will argue that this comparison highlights the learning of generic relational knowledge, which has been somewhat neglected in science education literature. I will also discuss the specific processes associated with learning of such knowledge. Lastly, I will discuss the implications for research.

A longitudinal study of the development of science knowledge among 4th to 8th grade students

Keywords: Cognitive development, Conceptual change, Quantitative methods, Science education

Presenting Author:Erzsébet Korom, University of Szeged, MTA-SZTE Science Education Research Group, Hungary; **Co-Author:**Erzsébet Antal, University of Szeged, Hungary; **Co-Author:**Zsófia Gabriella Szabó, University of Szeged, Hungary; **Co-Author:**Gyongyver Molnar, University of Szeged, Hungary; **Co-Author:**Benő Csapó, University of Szeged, Hungary

In this paper, we examined the development of a set of basic science concepts (e.g., matter, life forms, characteristics, classification and conditions of life, the properties of matter) among 10 to 14 year-old students. The objective of the study is to examine (1) the differences in students' science knowledge over the years; (2) the predicting power of the starting abilities on later achievement and (3) to compare developmental changes regarding the different subject areas. The sample was drawn from 4th, 6th and 8th grade students. Different versions with different item difficulty of science tests were used, which varied by grade. Versions contained anchor items, so achievement scores could be represented on a single scale. The contents of the tests were adjusted to the school curriculum. Rasch-model was used for scaling the data. Plausible values and weighted likelihood estimation were computed to compare the achievements of the age groups and to obtain individual level point estimates. The internal consistency of the instrument was high ($a_{\text{grade4}}=.93$; $a_{\text{grade6}}=.913$; $a_{\text{grade8}}=.925$). Across all grades, development of science knowledge is obvious. The fastest development happened from grade 4 to 6. Initial abilities had a lasting effect: relative abilities did not change significantly over time. The mean probability of correct solution of items belonging to the different subject areas increased with age. The differences at student level in the same grade were getting larger and varied by subject areas. Findings of the present paper identify factors having predicting power on the developmental level of students' scientific knowledge.

Diurnal Cortisol Patterns, Motivational and Socio-Emotional Regulation in University Students

Keywords: Emotion and affect, Higher education, Neuroscience, Motivation and emotion

Presenting Author:Katherine Cheng, University of Nebraska, Lincoln, United States; **Presenting Author:**Jenefer Husman, University of Oregon, United States; **Co-Author:**Reinhard Pekrun, Ludwig-Maximilians-Universität (LMU), Germany

Building upon Control Value Theory (CVT), the current study examines socio-emotional and motivation factors and their associations with diurnal cortisol patterns in post-secondary university students. University students provided survey and salivary cortisol data at the beginning of the semester, mid-semester during a stressful academic event, and near the end of the semester to gauge recovery. Diurnal cortisol slope near the end of the semester was found to be related to negative emotions earlier on in the semester, and social support throughout mid-semester the end of semester. Diurnal cortisol slope was also found to be predicted by an interaction between students' future time perspective (value subscale) and their emotion regulation (reappraisal). Results support the physiological aspect as an academic emotional facet as described in CVT; findings also call for the inclusion of future-oriented motivation to be incorporated into CVT.

Beneficial for all? Differential effects of an autonomy-supportive intervention in the classroom

Keywords: Motivation, Quantitative methods, Quasi-experimental research, Motivation and emotion

Presenting Author:Barbara Flunger, Utrecht University, Netherlands; **Co-Author:**Axel Mayer, RWTH Aachen University,

Germany; **Co-Author:**Nora Umbach, University Tuebingen, Germany

The present study investigated whether an autonomy-supportive intervention had differential effects on students' achievement emotions (state anger, boredom, joy, interest) and self-regulatory strategies (state effort, monitoring), depending on students' characteristics. The study was conducted with a sample of 345 ninth grade students in 17 physics classroom that were randomly assigned to an experimental or a control condition. Students in both conditions received a standardized teaching on heat transfer that either entailed autonomy support by the teacher (via provision of choices, provision of rationales, and informational language) or was taught with the regular teaching style. As potential moderators, a range of student characteristics was selected (i.e., prior physics grade, general physics-related effort, interest, extrinsic motivation, self-efficacy, and perceived autonomy). The differential effectiveness of the autonomy-supportive intervention was investigated with the EfficacyLiteR approach. Both the overall effects of the intervention and conditional effects (i.e., distinct interactions of the intervention with each of the student characteristics) were estimated. Regarding average treatment effects, the results showed that the autonomy-supportive intervention had a positive impact on all outcomes. Moreover, the results showed that students' prior grades moderated the effects of the intervention regarding four of the six considered outcomes (with the exception of anger and monitoring). In addition, conditional effects of the intervention with general physics-specific effort (concerning the outcome boredom) and with gender (concerning the outcome monitoring) were found. These findings point to the relevance of a detailed analysis of the differential effects of motivational interventions.

Interest profiles of Finnish 6th graders: Are they related to academic well-being and grades?

Keywords: Educational Psychology, Informal learning, Out-of-school learning, Motivation and emotion

Presenting Author:Maija Nuorteva, University of Helsinki, Finland; **Co-Author:**Lauri Hietajärvi, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland

The new Finnish curriculum, calling for active and engaging learning that supports students' agency, emphasizes creating meaningful contexts which interrelate also with students' out-of-school interests. Research shows participating with organized out-of-school activities has a positive relation to school grades, but what role do topics of interest (TOI) and interest-driven participation (IDP) play in school engagement if the goal is to promote agency? This study explores the TOI and IDP and further the relation to school engagement, school burnout and grades (GPA) of 6th graders. The study was part of Mind the Gap project (Academy of Finland #265528) and the participants (n=735) were 6th graders from Helsinki. Content categorization showed a rich variation of interests, largest categories being sports (43,8%) and arts (27,9%). The quantitative analyses looked at the intensity and form of the activities. We identified three interest profiles with two-step CA: organized team participators, informal individualistics and intensive participators. The organized team participators were most engaged and reported least burnout and had highest GPA whereas informal individualistics had lowest school engagement. Intensive participators were engaged to school, but had highest levels of burnout and the lowest grades. The results indicate lack of IDP in schools: only intensive participators were almost as active inside as outside of school. It may be difficult for teachers to adopt new practices that call for supporting IDP. However, it would be important to use students' personal interest to promote student agency and support school engagement.

Factor Structure of a 3 x 2 Student Achievement Goal Orientation Inventory in Math

Keywords: Educational Psychology, Goal orientation, Mathematics, Motivation

Presenting Author:Hadley Solomon, University of New Hampshire, United States; **Co-Author:**Carla Evans, University of New Hampshire, United States; **Co-Author:**Suzanne Graham, University of New Hampshire, United States; **Co-Author:**Te-Hsin Chang, University of New Hampshire, United States

The 3 x 2 Student Achievement Goal Orientation Inventory in math was designed with a series of items adapted from Elliot, Murayama, & Pekrun (2011). These items were designed to assess the key dimensions of achievement goals (task, self, and other). The purpose of this study was to evaluate and compare four models: (a) 1 x 2 factor model, (b) 2 x 2 factor model, and (c) 3 x 2 factor model. Data from 261 high school students were used to conduct a confirmatory factor analysis. Modification and model fit indices were used to assess goodness-of-fit. Results indicate the 3 x 2 factor model was confirmed as the best fitting model. Modification and fit indices, limitations, and applications are discussed.

Context factors and individual prerequisites fostering apprentices' intrapreneurship competence

Keywords: Cognitive skills, Competencies, Vocational education, Workplace learning

Presenting Author:Christine Kreuzer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Sandra Bley (geb. Trost), Ludwig-Maximilians-Universität, Germany; **Co-Author:**Susanne Weber, Ludwig-Maximilians-Universität (LMU), Germany

Intrapreneurship competence as entrepreneurship competence within a company is seen as one of the most important behavior of commercial clerks. Correspondingly it is goal of the curricula and examinations of different German apprenticeship programs in the fields of business and commerce. By a regional and a German-wide study prerequisites and effects of teaching and training intrapreneurship competence have been measured by using simulated authentic workplace tasks. As relevant impact factors individual and social context factors, institutional contexts and regional contexts were chosen. As instrument for securing a reliable and valid assessment the evidence-centered design approach as well as several validity studies were taken. By using item response theory the data are statistically analyzed. Results for the regional study (N=357) are given, for the German-wide study (N=906) under work. First results show that the data give important hints for designing efficient and effective environments to foster intrapreneurship competence.

Knowledge-creative context as mediator for determinants of innovative work behaviour

Keywords: Developmental processes, Social interaction, Survey Research, Knowledge creation

Presenting Author:Michael Hellwig, University of Regensburg, Germany; **Co-Author:**Gerhard Messmann, Department of Educational Science, University of Regensburg, Germany; **Co-Author:**Regina Mulder, University of Regensburg, Germany

This study addresses knowledge-creative context, psychological empowerment and transformational leadership as determinants of innovative work behaviour (IWB). For organizational as well as for political decision making, significant insights are necessary into how innovations as important precondition for sustainable success can be fostered in organizations. Because innovations base on individual ideas, IWB as work activities related to the development of innovations is pivotal for organizational innovation processes. Being individual behaviour, IWB might be facilitated or inhibited by team and work context-related factors, such as transformational leadership and a knowledge-creative context, as well as by individual factors, such as psychological empowerment. Based on these assumptions, we conducted a cross-sectional survey study with N=122 individuals working in different teams and organizations. Hierarchical regression analysis and Sobel tests were carried out to analyse direct and indirect effects of transformational leadership, knowledge-creative context and psychological empowerment on IWB. Results show that the knowledge-creative context mediates the positive effect of transformational leadership on IWB. An indirect effect of transformational leadership through psychological empowerment could not be verified. Results indicate the importance of further investigations on the relationship between knowledge creation and IWB as well as on the role of work context characteristics for individual contributions to innovations.

ePortfolio systems in Norwegian vocational education and training (VET); an exploratory study.

Keywords: Assessment methods and tools, Computer-assisted learning, Vocational education, Workplace learning

Presenting Author:Leif Christian Lahn, University of Oslo, Norway; **Co-Author:**HÆGE NORE, INSTITUTE OF VOCATIONAL TEACHER EDUCATION, HIOA, Norway

The present paper is based on a study of ePortfolios in Norwegian VET where fairly new intermediary institutions between school and work, the training offices, have been the site for the development of this technology with an overall ambition to bridge the work-based learning of apprentices and educational requirements. Datasets are generated from personal interviews with apprentices/instructors, documentary data of ePortfolio use and selected items on a survey to apprentices. The analysis of this material combine thematic analysis and a multiple case approach. Our results indicate that different constellations of dominant actors in Norwegian VET have a strong influence on the function, configuration and the learning potential of the ePortfolio systems. They seem to support a restrictive in contrast to an expansive learning mode (Fuller & Unwin, 2010) where the opportunities for "boundary crossing" have not be fully realized. The paper suggests that further processual studies are needed guided by Susan Lee Stars (2010) concept "boundary infrastructure".

Supportive behaviours in the VE classroom. How vocational education teachers scaffold learning.

Keywords: Mixed-method research, Teaching / instruction, Video analysis, Vocational education

Presenting Author:Antonia Scholkmann, University of Hamburg, Germany; **Co-Author:**Jens Siemon, University of Hamburg, Germany; **Co-Author:**Tekla Paulsen, University of Hamburg, Germany

Open learning phases are pivotal in many up-to-date instructional formats in vocational education, because they yield the potential to generate learning that enhances competences for future vocational success. However, little is known about how vocational educational teachers actually support the students' learning processes in these phases, and which patterns of supportive behaviour might or might not be beneficial for students' learning processes and group interactions. The proposed paper will set out to answer the question which types of supportive behaviours and behaviour patterns can be identified with respect to teachers teaching in different strands of the vocational educational school track in German postsecondary education. For that, in the present study, a total of 23 teachers from classes in three fields of vocational education were videotaped in naturalistic classroom situations whilst supporting open learning phases. The fields under survey were a) business education, b) education for industrial-technical occupations and c) education for person-related services. Supportive behaviours were inferred following the suggestion of Van de Pol, Volman, & Beishuizen, 2010 to distinct between various scaffolding means, however new descriptors were developed in an inductive process to match the

supportive behaviours prevalent in the setting of a naturalistic classroom. The overall results show that, within the vocational strands, the amount of teacher support does not vary between individual classes or teachers. However, a distinction can be noted in the patterns of supportive behaviour between teachers from business education and teachers from education for industrial-technical occupations and person-related services.

Embodied Metaphors and Computing Education

Keywords: Cognitive development, Conceptual change, Learning approaches, Primary education

Presenting Author: Peter McKenna, University of Edinburgh, United Kingdom; **Co-Author:** Andrew Manches, University of Nottingham, United Kingdom; **Co-Author:** Thusha Rajendran, Heriot-Watt University, United Kingdom; **Co-Author:** Judy Robertson, University of Edinburgh, United Kingdom

In many countries, primary age computing education is being driven forward to prepare children for the future global economy. This has created a need for learning science research to inform pedagogy. Research in other STEM subjects (e.g. Mathematics) has indicated the potential of embodied cognition theories to provide unique, body-based, perspectives on the learning process, suggesting that children's conceptual understanding can be supported by opportunities to reinforce particular sensorimotoric representations (e.g. through hand gestures). The work reported in this paper is an initial examination of evidence for sensorimotoric representations underpinning early computing concepts. This was addressed through examination of the gestures generated by domain experts (students studying computing in higher education (N=16; F: 9; M: 7)) when asked to explain elementary computing concepts, e.g. 'algorithm'. Interview sessions were video-recorded, and subsequent video analysis coded and quantified the use of representational gestures (gestures simulating the form or trajectory of a concrete object). This paper focuses on three concepts, where 368 representational gestures were used by participants, all of whom gestured at least once. Analysis of gestures identified two overarching body-based metaphors: Computing Constructs as Physical Objects and Computing Processes as Motion along a Pathway. These metaphors are highly comparable to those previously proposed as underpinning mathematical concepts, which is arguably predictable given commonalities between domains. Further work is clearly needed; however, the study findings elucidate the potential of an embodied cognition lens to further our understanding of the conceptual foundations of elementary computing concepts and inform pedagogy.

A model of immersion for learning in relation to learners' characteristics and cognitive load

Keywords: Learning Technologies, Motivation, Science education, Student learning

Presenting Author: Yiannis Georgiou, Cyprus University of Technology, Cyprus; **Co-Author:** Eleni Kyza, Cyprus University of Technology, Cyprus

Immersion, which can be defined as a multi-level continuum of cognitive and emotional involvement, has been argued to facilitate learning in technology-rich environments. Despite this claim, recent studies have found no relations between high levels of immersion and learning; a speculation is that this may be attributed to the mediation of cognitive load and learners' cognitive characteristics. However, there are no published studies investigating a possible model specifying relationships between mediating factors and immersion in relation to learning. In this study, we propose a cognitive model of immersion in relation to learning in Augmented Reality (AR) location-based settings; this model acknowledges potential mediation effects due to students' cognitive load, domain-specific motivation, and cognitive motivation. We investigated this model with 135 10th graders, who employed a location-aware AR app for learning science. Using a path analysis approach, we have found that, as in previous empirical studies, higher levels of immersion had no significant effect on students' conceptual understanding. However, extending previous research, this study contributes to understanding how cognitive load, domain-specific and cognitive motivation can mediate immersive experiences, and subsequent learning. According to our findings, domain-specific motivation and cognitive motivation have emerged as significant positive predictors of immersion. In contrast, we have found that cognitive load was a significant negative predictor of immersion. These mediating effects provide empirical evidence for explaining the lack of relationships between higher levels of immersion and students' learning. Implications of the results are discussed in combination with future research pathways.

Hava : Collaborative Learning of first aid gestures with a multi-touch table

Keywords: Collaborative Learning, Comprehension of text and graphics, Educational Psychology, Educational Technology

Presenting Author:Jonathan Groff, Telecom-ParisTech- I3 - CNRS, France

Collaborative learning is defined as “a situation in which two or more people learn or attempt to learn something together” (Dillenbourg, 1999). Since the late 1990s, researches on the collaborative learning mainly concern computer-supported collaborative learning with text material. Our studies focus on a rather different application: learning first aid gestures from a series of dynamic visual pictographs controlled by different learners with a multi-touch table. Previous works have shown that pictographic information displays have the potential to deliver procedural announcements in emergency contexts (Groff, Bassetti & Boucheix, 2015). In the present research, we analysed them in a learning situation. Forty participants (8-10 years old) were asked to assemble, in the correct order, the different episodes of first aid gestures on a sensory table including multi-touch option (with multi-touch option, several people can use the table at the same time). Three variables were analysed: (i) with/without multi-touch option, (ii) single/collaborative session, (iii) ‘animated pictographs’ presentation/‘classical verbal’ presentation. Statistical analysis revealed a significant effect of the modality “multi-touch+collaborative+pictographs” which leads to the better performances. Results demonstrated that “multi-touch” option promotes a more balanced participation by allowing all subjects to share their point of view. They demonstrated that the collaborative manipulation of pictographic “episodes” gives them the opportunity to present their approach, by basing on a set of common external representations, then to compare it with other and thus to adjust their own internal representations. In this way, it would support the construction of an analogue and effective mental model.

Teachers' and pupils' acceptance of tablet devices: A longitudinal study.

Keywords: Attitudes and beliefs, Computer-assisted learning, Educational Technology, Secondary education

Presenting Author:Hannelore Montrieux, Ghent University, Belgium; **Co-Author:**Tammy Schellens, Ghent University, Belgium

This paper reports on the introduction of the tablet as a personal, mobile learning tool in a secondary school in Belgium. In this longitudinal research project, drawing upon the Theory of Planned Behavior, we question the relative extent to which attitude, subjective norm, and self-efficacy explain the prospective uptake of the device for educational purposes. The results indicate that attitudes towards the rollout are generally positive. Teachers are dominantly intrinsically motivated, welcoming it as a useful and easy-to-use aid. Pupils do report feelings of social influence, albeit mostly by parents and peers. The role of attitude is much stronger. The pupils also consider the tablet as instrumental, although their positive attitude is strongly linked to the expectation of having a more enjoyable learning experience. These results challenge teaching practices and invite manifold areas for further research. Moreover, during November 2016, a remeasurement is planned and a comparison of the results will be available at the conference.

The International Lexicon Project: Project Methodology with Illustrations from Japan and Australia.

Keywords: Communities of practice, Culture, Teacher Professional Development, Teaching / instruction

Presenting Author:Yoshinori Shimizu, University of Tsukuba, Japan; **Presenting Author:**Carmel Mesiti, University of Melbourne, Australia; **Co-Author:**Yuka Funahashi, Nara University of Education, Japan

The Japanese team sought to identify shared terms used by teachers for describing and discussing teaching and learning in the classroom. The practical goal was to inform the practice of teachers, teacher educators and researchers by using the lexicons from other countries as a mirror on one's own practice and also as a window into cultural differences. The Japanese tradition of Lesson Study has created a teaching community in which discussion of mathematics lessons is an integral part of professional practice. The Japanese Lexicon team members took part in a video viewing process to identify the terms used by Japanese middle school mathematics teachers. Following identification of a local lexicon by the research team, steps were taken to obtain national validation of the identified lexicon. One of the most distinctive features of the Japanese Lexicon was the value-laden nature of many of the terms and phrases. It is significant that other lexicons were less explicit.

Chilean Lexicon of middle-school mathematics teaching: insights from a developing educational system

Keywords: Communities of practice, Culture, Teacher Professional Development, Teaching / instruction

Presenting Author:Elisa Calcagni, University of Cambridge, United Kingdom; **Co-Author:**Valeska Grau, Pontificia Universidad Católica de Chile, Chile

The aim of this paper is to describe the generation and validation of the Chilean national lexicon of middle-school

mathematics teachers, part of the Lexicon project, in which another 8 countries from four continents take part. This paper aims to make visible local practitioner vocabulary that is often inaccessible to English-written educational research. Initially, four researchers and two practitioners discussed video stimuli to generate a list of terms and descriptions. These terms represent actions and events that mathematics teachers can name. The result was a list of 78 terms, of which only 18% were mathematics-specific, the rest being general pedagogical terms. The second phase aimed to address the local validity of the lexical terms through engagement with members of the Chilean mathematics education community. The original terms were revised, resulting in 71 terms that were assigned to five forms of an online survey, featuring 14 to 15 terms each. The survey was sent to mathematics teachers and educators, obtaining 29 answers (24,9% response rate). Of the 71 terms, 45 were known to 100% of respondents, another 13 were known by 77 to 88% of respondents. Therefore, 58 of the lexical items seem to be well known to participants, and could be thought of as part of the Chilean mathematics teachers' lexicon. Thirteen terms were known by 66% of participants or less, and thus their pertinence within the Lexicon must be further assessed. These less familiar terms will be examined by experts as part of the future validation process.

The Finnish Lexicon: Prioritising the organising and shaping of practice over mathematical content

Keywords: Communities of practice, Culture, Teacher Professional Development, Teaching / instruction

Presenting Author:Fritjof Sahlström, Åbo Akademi University, Finland; **Co-Author:**Markku Hannula, University of Helsinki, Finland

This paper addresses the question: What are the terms that Finnish teachers use to describe the phenomena of grade eight mathematics classroom? Data generation was undertaken simultaneously in Finland and other countries, where each participating team contributed to a stimulus package. This material was viewed by team members in each country. The national lexicon involves the assembly of local terms reflecting pedagogical traditions of participating communities. A total of 103 terms have been identified for inclusion in the Finnish National Lexicon: Education/Upbringing (15 terms), Organizing (23 terms), Evaluation/Assessment (17 terms), Teaching methods (38 terms), and Mathematical content (12 terms). The distribution reflects a distinctive prioritization of practice, with teaching methods and organizing accounting for 59 percent of the lexical terms. The Finnish lexicon seems to prioritize lexical terms for structural features of the lesson rather than terms that describe action, and there are a number of lexical terms that identify the purpose of something rather than its form. In common for almost the entire lexicon is a highly generic way of naming and identifying classroom practices, with few items being specific to Mathematics. Further, there does not seem to be a defined and generally explicated and acknowledged hierarchy of terms. The Finnish lexicon seems to illustrate an educational emphasis on practices and methods, rather than on subject-specific instruction. The results presented contribute to classroom practice-based international comparative discussion in new ways, opening up for new insights into cultures of teaching in classrooms around the world.

Using video clubs to developing teachers' thinking and practice in feedback and dialogic teaching

Keywords: Primary education, Teacher Professional Development, Teaching / instruction, Video analysis

Presenting Author:Peter Davies, University of Birmingham, United Kingdom; **Co-Author:**Tom Perry, University of Birmingham, United Kingdom; **Co-Author:**Josephine Brady, University of Birmingham, United Kingdom

We report the outcomes of an evaluation of a 'video club' intervention to improve the thinking and practice of teachers in giving feedback and engaging in dialogic teaching. The intervention involved 92 teachers from 11 primary schools in England. Participating teachers worked collaboratively in a sequence of six video clubs over a six month period. A range of data were collected through: recording of individual use of the online platform; videos of film club meetings; a before and after survey; shared videos of classroom lessons; two focus groups with school co-ordinators; end of project telephone interviews with participating teachers. We gathered survey responses from non-participating as well as participating teachers. Analysis of change over the period of the intervention found that participating teachers became more likely than non-participating teachers to report that, in their feedback, they posed serious challenges to pupils, helped pupils to review the steps they had taken in solving problems and helped pupils to work out problems with their answers (effect sizes .3 to .5). These results were corroborated by the other data. Our study provides a new instrument for gathering evidence of change in teachers' thinking and practice in feedback and provides evidence of change in teachers' thinking and practice through corroboration of comparative survey data with analysis of lesson videos.

How children with different levels of mathematics anxiety perceive and approach mathematical tasks.

Keywords: Emotion and affect, Mathematics, Mixed-method research, Primary education

Presenting Author: Sonia White, Queensland University of Technology, Australia; **Co-Author:** Kate Williams, Queensland University of Technology (QUT), Australia; **Co-Author:** Maria Viviani, Queensland University of Technology (QUT), Australia; **Co-Author:** Lyn English, Queensland University of Technology (QUT), Australia

Mathematics anxiety can have negative effects on children's mathematics education and contributing the development of negative attitudes towards tasks involving mathematics. Grade 4 and Grade 5 children ($n = 158$) completed general, test and mathematics anxiety scales and latent profile analysis determined five distinct anxiety profiles. A subsample of children ($n = 13$) were interviewed to investigate differences in how children with different anxiety profiles perceive mathematics and how they would approach a specific mathematics problem. The findings will be discussed in relation to the ways in which group work with peers, individual work, and support by teachers attenuates or exacerbates children's sense of anxiety in the face of particular mathematics tasks.

How 1st year study engagement predicts later situational task value and daily emotional experiences?

Keywords: Emotion and affect, Higher education, Quantitative methods, Motivation and emotion

Presenting Author: Elina E. Ketonen, University of Helsinki, Finland; **Co-Author:** Lars-Erik Malmberg, University of Oxford, United Kingdom; **Co-Author:** Hanni Muukkonen, University of Oulu, Finland; **Co-Author:** Katariina Salmela-Aro, Helsinki Collegium for Advanced Studies, Finland; **Co-Author:** Kirsti Lonka, University of Helsinki, Finland

The present study examines individual differences in relation between situation-specific task value and academic emotions using intraindividual assessment. Our aim was to investigate how study engagement and study burnout in the beginning of university would moderate situational experiences during the first two years of study. Study engagement, study burnout and control variables (i.e., life satisfaction and depressive symptoms), were measured with questionnaires in the beginning of the first academic year. Intraindividual state assessments were conducted via mobile phone-based experience sampling (ESM) during participants' first ($N=50$) and second ($N=36$) academic year. Five times during 14 consecutive days, we asked about students' current activity, how important they perceived this activity and their positive and negative emotions. The ESM-data represented a hierarchical three-level structure, with situations (Level 1) nested within years (Level 2) nested within students (Level 3). The results of multilevel models indicated that perceived value of the activity either decreases or increases negative emotions, depending on the individual. Furthermore, positive emotional responses to perceived value varied significantly in magnitude between students. The findings suggest that high study engagement in the beginning of university could further increase positive emotions in activities that are perceived personally important in everyday situations, even beyond the first year. Furthermore, while depressive symptoms and life satisfaction strongly predicted negative emotions in everyday situations, the dimensions of study burnout also had an influence. Cynicism in particular predicted negative emotions even beyond the first year, and could therefore indicate a deeper, more enduring problem hindering academic well-being.

The effect of study skills courses on learning-related emotions

Keywords: Achievement, Emotion and affect, Higher education, Quasi-experimental research

Presenting Author: Verena Schmied, University of Kassel, Germany; **Co-Author:** Martin Haenze, University of Kassel, Germany

The present study examines the effect of study skills courses on general study competences and learning-related emotions. Further, the study shows whether positive changes in learning-related emotions are mediated by increased general study competences. An online questionnaire measured general study competences on three scales (motivation and organization of the learning process, planning and work posture, stress management). Items of the Achievement Emotions Questionnaire (AEQ) by Pekrun, Goetz and Perry (2005) were used to measure achievement emotions. The treatment group consists of 185 students from seven different universities in Germany who voluntarily attended a study skills course to improve their general study competences. This group answered the questionnaire before and two months after having attended a course. Students of a control group ($n = 147$) did not participate in such a course but also answered the questionnaire in a time interval of two months. Analyses show that students who attended a study skills course rate their general study competences and positive learning-related emotions significantly higher (or lower concerning negative emotions) two months after having attended such a course compared to the students of the control group. Latent change models suggest that positive changes in specifically learning-related emotions are affected by positive changes in general study competences. These findings have significant implications for the understanding of how study skills courses influence the study process and thereby study success. The evidence from this research suggests that study skills courses are one possibility to support especially first-year students when entering university.

Implications of emotional experience and perceived competence on achievement in mathematics

Keywords: Achievement, Emotion and affect, Mathematics, Motivation and emotion

Presenting Author: Natacha Boissicat, Université Grenoble Alpes, France; **Co-Author:** Michael Fartoukh, Université de Nice Sophia-Antipolis, France; **Co-Author:** Jérémy Pouille, Université Grenoble Alpes, France

The main purpose of the study was to examine, among pupils in their fifth grade, the impact of emotion on cognition generated by a domain potentially stressful for them, mathematics. It is acknowledged that when mathematics generate negative thoughts and worries among children (Reschly et al., 2008 ; Fartoukh et al., 2014), it may impact the resources

allocation (Ashcraft, 2002), that in turn may impair performance in maths. We hypothesized that emotions generated after the teacher announced a mathematics task would impact pupils' achievement in that task, especially when they hold a low perceived competence in maths. When they experienced negative emotions after the announcement of the maths task, we predicted that pupils with a low perceived competence would succeed lower compared to their peers who experienced positive emotions. This study took place in two parts. *Part 1.* We measured anxiety, perceived competence and achievement in mathematics (controlled variables). *Part 2.* At first, we measured verbal and non-verbal positive and negative emotions (T1). Then, pupils were told they were going to complete a maths task and before to complete it, we measured a second time verbal and non-verbal positive and negative emotions (T2). Finally, they had to complete a maths task. Results confirmed our predictions and revealed that emotions at T2 were negatively related to pupils' achievement at the maths task only among children who had low perceived competence in maths: the more pupils experienced negative emotions, the less they succeed the task.

What does research evidence say about peer review of teaching? The As, Bs, and Cs

Keywords: Cognitive development, Educational Psychology, Higher education, Teacher Professional Development

Presenting Author: Lily Min Zeng, The University of Hong Kong, Hong Kong

Peer Review of Teaching (PRT) has been one of the most common professional development practices in higher education. Though it is believed to be an effective tool for teachers to improve their teaching practices, there are concerns among university teachers and those who are in managerial roles about using PRT in higher education. Some of these concerns were correlated with the ways that PRT were conducted. This paper takes the teaching development of university teacher as a learning process. It looks at the impact of PRT in the three domains of learning in teachers' teaching development and how these three aspects are related to the ways the PRT is carried out. A systematic review of the demonstrated evidence on PRT published in peer-reviewed publications was conducted based on a solid theoretical and educational framework. This study is important as there hasn't been such a review on PRT using a solid theoretical framework so that the analysis can investigate the areas that has a proven record of importance to teachers' learning and development. The review provides theoretically sound and practicable implications for PRT practices in higher education.

Predictors of Faculty Occupational Well-being in Canadian Universities: A Survey Study

Keywords: Educational Psychology, Higher education, Quantitative methods, Survey Research

Presenting Author: Alenoush Saroyan, McGill University, Canada; **Co-Author:** Nathan Hall, McGill University, Canada;

Co-Author: Zaynab Sabagh, McGill University, Canada

Changes imposed on higher education institutions have led to a challenging employment climate that sometimes adversely affects faculty occupational well-being and productivity. Despite potentially serious consequences, research on faculty occupational well-being is still in its infancy and scattered. This paper present findings of a survey study examining predictors of occupational well-being among 380 faculty members in seven Canadian research universities. Burnout and engagement were chosen as two indicators of occupational well-being in the present study. Workload, work-home conflict, and control was the examined predictors. The results of the study showed that high workload and work-home conflict can lead to the experience of burnout, whereas control in the workplace can increase engagement and reduce burnout. These insights can inform the design of interventions and the provision of resources at both individual and institutional levels to help faculty offset burnout.

Professional Development of Teacher Educators - Doubts and confusion while teaching my colleagues

Keywords: Communities of learners, Higher education, Peer interaction, Lifelong learning

Presenting Author: Naomi Weiner-Levy, Mofet institute ; david Yellin Academic College, Israel

The Mofet Institute of Research, established a School of Professional Development, the only one of its kind in Israel and quite unique worldwide. It offers specialized programs for teacher educators, providing them with the professional knowledge and skills. The studies aim at updating teachers about rapidly changing knowledge and skills. The instructors are third-order practitioners[1] – teacher educators specializing in teaching their colleagues. Collegial guidance by teachers' college staff members is no simple task: Tutors must be expert in their field of specialization, as well as in instruction. Moreover, although colleagues, they have to position themselves within the group as authoritative figures in terms of

instruction and knowledge. To date, the role and professional identity of these third-order practitioners, has not been studied. To understand the nature and development of professional identity, a qualitative study was conducted in which 12 tutors of various subjects were interviewed. These were analyzed by categorical content analysis. The findings, assessed professional identity through a post-modern prism, while examining the interplay among events that tutors experienced, the knowledge they acquired and the structuring of their professional identity. The Tutors' identity transformed through negotiating with 'self' and 'other' in the class, and constructed by their mutual experiences as tutors and learners. Understanding the function and identity of tutors facilitates comprehension of this unique training process for teacher educators.

[1] Teacher educators are conceptualized (Murray, 2005) as shifting from first-order practitioners (school teachers) to second order practitioners. I refer to those who train teacher educators as third-order practitioners.

University Students & Self-Regulated Learning: Knowledge versus Action

Keywords: Competencies, Educational Psychology, Higher education, Self-regulation

Presenting Author:Nora Maria Foerst, University of Vienna, Austria; **Co-Author:**Julia Klug, University of Vienna, Austria;

Co-Author:Barbara Schober, Universität Wien, Austria; **Co-Author:**Christiane Spiel, University of Vienna, Austria

University students are supposed to be autonomous learners able to adapt to a less guided educational environment than students are used to at school. Hence, probably the most important skill students need to develop to be successful during higher education is self-regulated learning (SRL). Since there are many studies assessing SRL via classical self-report, we know a lot about how students self-assess their SRL strategies. However, we know little about students' knowledge as well as about their actual usage of these strategies. Thus, the aim of the present study is to get to know if there are discrepancies between students' knowledge and action concerning SRL strategies, if these are general across domains and which reasons students tell us if discrepancies occur. For this purpose, the "Self-regulated learning questionnaire for action and knowledge" (SRL-QuAK) was used in a sample of 408 students of the University of Vienna (Mage= 25.36 years, SD = 4.88). 175 (43%) studied psychology and 233 (57%) studied economic sciences. Results showed that despite students' knowledge about SRL strategies being quite advanced, this knowledge does not seem to be put into action. This discrepancy between SRL knowledge and action was found in both sub-samples, students of psychology and economic sciences, indicating generalizability across fields of study. The resulting evidence can be used to adapt study programs and to create training in order to ameliorate students' use of SRL strategies based on the reasons students report for not applying adaptive or for applying maladaptive strategies.

Differential teacher effectiveness on student engagement and learning attitudes

Keywords: Quantitative methods, Self-regulation, Teacher Effectiveness, Teaching / instruction

Presenting Author:James Ko, The Education University of Hong Kong, Hong Kong; **Co-Author:**Pamela Sammons, University of Oxford, United Kingdom; **Co-Author:**Leonidas Kyriakides, University of Cyprus, Cyprus; **Co-Author:**Ridwan Maulana, GION - University of Groningen, Netherlands

Various theories concerning teacher effectiveness (e.g., Campbell, Kyriakides, Muijs & Robinson, 2003; Creemers & Kyriakides, 2008; Marzano, 2003) indicate that consistency and variation in teaching practices may affect individual teacher effectiveness and collective teacher effectiveness in a school, but have not received enough regard. The study reported here was based on the analyses of 400+ lessons of 240 teachers from Hong Kong, Shenzhen and Guangzhou and in-depth analyses that linked the teacher effectiveness results of six teachers in two-year observations with student surveys. A model of differential teaching effectiveness was first established based on the variation and consistency across teaching dimensions and across lesson contexts and then ANOVA was conducted to examine the effect of teacher effectiveness on students' self-regulated learning and attitudes to assessment. Findings suggest that studies relying on single measure in teacher evaluation and teaching research may yield biased results. Promoting inclusive education extensively might also have impeded teaching effectiveness and learner engagement. Impacts of modest teaching effectiveness on self-regulated learning was also evident. Interestingly, students showed less favorable attitudes toward assessments when they were taught by moderately effective teachers than students who were taught by highly effective or ineffective teachers. The theoretical and practical implications of these results suggest we should examine the impact of teacher effectiveness on student engagement and learning attitudes is not always linear.

Language learning strategies of EFL learners and their effects on learning outcomes

Keywords: Cognitive skills, Language (Foreign and second), Quantitative methods, Second language acquisition

Presenting Author:Katrin Saks, University of Tartu, Estonia; **Co-Author:**Äli Leijen, University of Tartu, Estonia

Foreign language acquisition can be supported through learners' language learning strategies. Researchers have compiled several strategy taxonomies but evidence on their validity is contradictory. The aim of this study was to find the most solid strategy classification based on empirical data, investigate the connections of language learning strategies and their effect on learning outcomes. The results of confirmatory factor analysis showed that the modified and re-specified 6-factor model had good model fit indices. The strategy groups that were formed expressed learners' metacognitive, social, compensation, memory, connecting and active language use strategies. The results of structural equation modelling confirmed that cognitive strategies had direct effects on learning outcomes, whereas metacognitive strategies affected learning outcomes indirectly through cognitive strategies. As a practical implication, the results of the study enable a fuller understanding of the relations of language learning strategies and learning outcomes, and implementing the knowledge in university pedagogy to facilitate language studies and in teacher education to prepare language teachers. However, the study was limited by considering the strategies applied in the learning situation only. Further research could usefully explore whether and how test-taking strategies, in addition to learning strategies, impact learning outcomes.

Explaining differences in reading competencies and motivation by instructional and school factors

Keywords: Literacy, Motivation, Secondary education, Teaching / instruction

Presenting Author:Brigitte Steinert, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Jan Hochweber, University of Teacher Education St. Gallen, Switzerland; **Co-Author:**Eckhard Klieme, German Institute for International Educational Research (DIPF), Germany

In line with the organization theory of school and models of educational quality, the aim of this contribution is a systematic investigation of the relationship between teacher collaboration and basic dimensions of instructional quality in the school subject German and their relationship to reading competencies and reading enjoyment of students at grade level nine. Data base of the analyses is the extended PISA 2009 sample in Germany including two complete grade nine classes and additional data from a teacher questionnaire from all German teachers in each school. The sample encompasses 9.246 students in 384 classrooms in 198 schools as well as 2076 German teachers in these schools. Teacher cooperation serves as indicator at school level. The three dimensions of instructional quality – cognitive stimulation, structured instruction, and support – serve as indicators at classroom level. The individual background of the students, their individual perceptions, and the social composition of the classrooms as well as the school type were controlled for in the analyses, to investigate the added value of school and classroom factors on student outcomes. According to the multi-level structure of the data in schools three level regression analyses were carried out using HLM. Summing up the findings of the analyses, student outcomes vary both at classroom and school level. Teacher practices can make a difference that is empirically significant and practically relevant. There are effects of instructional quality on student outcomes, but it may not be consistent over different school subjects. Subject specific teacher cooperation primarily affects instructional quality in a few school types.

Compositional effects on achievement and social outcomes of SEN students in inclusive classes

Keywords: Achievement, At-risk students, Special education, Student learning

Presenting Author:Katja Scharenberg, University of Education Freiburg, Germany; **Co-Author:**Wolfram Rollett, University of Education Freiburg, Germany; **Co-Author:**Wilfried Bos, Technical University of Dortmund, Germany

The ratification of the UN Convention on the Rights of Persons with Disabilities led to the development of inclusive education systems, teaching students with and without special educational needs (SEN) together in mainstream schools. Previous research showed neutral to positive effects of inclusive education regarding achievement, but indicated disadvantages for SEN students regarding social outcomes, e.g. less interactions with peers. There is, however, a lack of evidence regarding 1.) the importance of the classroom as students' proximal environment for learning and development and 2.) its interaction with individual characteristics. Our study aimed at examining such effects on students' achievement and social outcomes. The sample comprised 50 classes in German primary schools with 1,025 Grade 4 students of which 13.4 % had SEN. Multi-level analyses revealed overall beneficial effects of a more privileged socioeconomic classroom composition on students' achievement, but not on social outcomes. Negative interaction effects on social integration were found between SES and immigrant background. High-ability SEN students, in contrast, perceived a higher social integration than low-ability SEN students. The effect of SEN status on social integration was not mediated by classroom composition. Cross-level effects, however, indicated achievement benefits for SEN students in high-SES classes. Our study highlights that there seem to be relevant processes and mechanisms of social exclusion in inclusive classes that are associated with students' sociocultural origin and their SEN status. The results call for longitudinal analyses to further examine whether SEN students could benefit from inclusive classes regarding their development of achievement in secondary school.

University students' engagement construction in Finnish higher education

Keywords: Higher education, Quantitative methods, Social aspects of learning and teaching, Student learning

Presenting Author: Vesa Korhonen, University of Tampere, Finland; **Co-Author:** Markus Mattsson, University of Helsinki, Finland; **Co-Author:** Mikko Inkinen, Aalto University, Finland; **Co-Author:** Auli Toom, University of Helsinki, Finland

Student engagement throughout the university studies has been identified as one of the key aspects related to meaningful learning in higher education. Previous research on engagement has covered either internal factors or external factors related to student engagement. However, studies focusing simultaneously on both, and taking into account their complex interplay have been scarce. This study aims at gaining a better understanding of the interrelationships of the components of student engagement and its stability across different disciplines, especially the humanities and the educational sciences. Especially, we examined the interrelationships of the core areas of engagement in a representative sample of Finnish first-year university students ($n=2\,422$) using network analysis methods. The analysis showed how student engagement is structured, and demonstrated that the feelings of belongingness and alienation, and the sense of academic identity are the most central components of student engagement. The results also indicated that the networks describing the engagement phenomenon among the students in humanities and educational sciences were extremely similar.

Psychological flexibility - a key to success in university studies?

Keywords: Achievement, Emotion and affect, Higher education, Student learning

Presenting Author: Telle Hailikari, University of Helsinki, Finland; **Co-Author:** Henna Asikainen, University of Helsinki, Finland

In the context of working life, psychological flexibility has a central role in improving performances, well-being and results at the work place but its importance has not yet been explored in the university context widely. The purpose of this study is to explore qualitatively how students who score low and high on psychological flexibility experiences emotions and describe their key learning experiences at university. Participants were ten students with high psychological flexibility score and ten students with low score. Interviews concerning students key learning experiences were analysed with inductive content analysis. The preliminary results show that students who scored high on psychological flexibility reported more positive emotions, less stress and exhaustion than students who scored low on psychological flexibility. In addition, the high scoring students reported emotions such as hope and expectation of success related to their learning experiences which were not reported among the low scoring students. At the conference, we will elaborate the emotions more and present results based on more interviews.

The impact of cognitive resources on students' performance in mathematical proof construction

Keywords: Argumentation, Higher education, Mathematics, Quantitative methods

Presenting Author: Daniel Sommerhoff, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:** Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:** Ingo Kollar, University of Augsburg, Germany

Argumentation skills represent an important learning goal across domains. In mathematics, they are fixed in standards for secondary education worldwide. At the university level, argumentation is even more focal since mathematical proofs, i.e. deductive chains of argumentation that conform to specific socio-mathematical norms are introduced as a core method of mathematics as a scientific discipline and represent a major learning goal for students. Studies repeatedly show that even university mathematics students struggle to construct valid proofs. One reason for this and the large variation in students' proof construction skills may be explained by the availability of individual cognitive resources underlying students' proof construction skills. Although prior research has suggested multiple such resources, e.g. mathematical knowledge, problem solving skills or conditional reasoning skills, their relative importance is still mostly unclear. Furthermore, it is unknown, whether domain-general or domain-specific resources play a more important role. We report on a study with $N = 64$ university students, analyzing the relative influence of domain-specific (conceptual and procedural mathematical knowledge, mathematical-strategic knowledge) and domain-general (problem solving skills, conditional reasoning skills, metacognitive awareness) resources on students' proof construction skills. Results reveal that mathematical knowledge, mathematical-strategic knowledge, and conditional reasoning skills have an impact on students' proof construction skills. Comparing the regression coefficients shows that the overall impact of domain-specific resources is larger than those of domain-general ones. The implications of these results regarding the role of domain-specific vs. domain-general resources as well as on instruction on (mathematical) argumentation and proof in higher education will be discussed.

Cooperative learning in higher education: Effects of fostering group work on students' achievement

Keywords: Cooperative / collaborative learning, Higher education, Self-regulation, Student learning

Presenting Author: Anika Bürgermeister, University of Leipzig, Germany; **Co-Author:** Henrik Saalbach, University of

Leipzig, Germany; **Co-Author:**Robert Wilkens, University of Leipzig, Germany; **Co-Author:**Romy Schneider, University of Leipzig, Germany

Cooperative learning is well-known to foster students' learning and understanding (Gillies, 2016, Johnson & Johnson, 2002, Slavin, 1995). Cognitively oriented explanations for these benefits usually refer to students' higher active engagement in elaborative and reflexive learning processes. Motivationally oriented explanations refer to a higher degree of feeling socially related, supported and comfortable within their peer group. So far, empirical evidence is mainly based on primary or secondary school level, while little research has been conducted in higher education (Herrmann, 2013). The present study thus aims at systematically investigating the factors mediating the positive effect of cooperative learning on students' achievement in higher education. In particular, we aim to disentangle cognitive, that is students' engagement, and motivational factors, that is students' social relatedness, to explain the impact on students' learning. For this purpose, we conducted a quasi-experimental longitudinal study and systematically fostered cooperative learning during self-regulated learning activities in a group of teacher students (EG, $n = 237$). First descriptive results show that students in the EG reported to feel more socially related during the semester and achieve higher performance than their peers in the control group (CG, $n = 260$) at the end of the course. Further analysis indicate, that students' social relatedness positively predicts their achievement at the end of the semester, in the EG but not in the CG. The crucial role of feeling related to peers as well as the impact of cooperative learning contexts for learning development in higher education are discussed.

Advancing Teaching and Learning Conceptions in Graduate Teaching Assistant Training

Keywords: Higher education, Learning approaches, Teacher Professional Development, Teaching approaches

Presenting Author:Alex Shum, The University of Hong Kong, Hong Kong; **Co-Author:**Ada Lee, The University of Hong Kong, Hong Kong; **Co-Author:**Suki Ekaratne, University of Colombo, Sri Lanka

Deep and surface approaches to learning in higher education contexts have been linked to student-focused and teacher-focused approaches to teaching. These connections should be taught and emphasized to improve the effectiveness of graduate teaching assistant (GTA) training courses. The current study investigated a short GTA training course at an Asian research-intensive university on impact of participants' conceptions of teaching and learning. It further explored predictive effects between latent variables in GTA approaches to learning and approaches to teaching. GTAs ($N=137$) completed the study process questionnaire and the approaches to teaching inventory at the beginning and end of the course. Student-focused teaching and deep learning scores increased with small-moderate effect. Past deep learning scores moderately predicted future student-focused teaching scores. Factor analysis of both questionnaires together revealed two factors, teacher-focused teaching with surface learning and student-focused teaching with deep learning. Implications for theory and practice are discussed.

Variables Explaining Learners' Emotions in Simulation-Based Learning Environments

Keywords: Emotion and affect, Higher education, Quantitative methods, Technology

Presenting Author:Tuulikki Keskitalo, University of Lapland, Finland; **Co-Author:**Heli Ruokamo, University of Lapland, Finland

Medical education can be emotionally charged for many reasons; simulation-based activities in particular are designed to generate emotional reactions. However, few studies have concentrated on learning and emotions despite widespread interest on the topic. The aim of this research is to study the emotional experiences of participants during simulation-based teaching and learning activities. The specific aim is to answer the following research questions: *What kinds of emotions do learners experience before and after simulation-based educational activities? Which variables explain learners' positive and negative emotions after simulations?* The data were collected using mixed methods, and pre and post questionnaires of 175 participants were analyzed using descriptive statistics as well as a paired-samples t -test, factor analysis, Cronbach's alpha, and a linear regression analysis. The results show that simulation-based learning invokes mainly positive emotions by creating challenges through goal-oriented studying, whereas negative emotions tend to remain constant during an educational course.

Performance profiling in higher education: A visualisation tool to inform strategy formulation

Keywords: Economics of education, Educational policy, Higher education, Mixed-method research

Presenting Author: Marian Mahat, The University of Melbourne, Australia

An effective visualisation tool of a university's performance can assist management to make strategic choices to locate themselves in niches where they can make use of their resources effectively and efficiently. Working within the case study context of medical education, this paper makes a contribution to higher education research by investigating the use of a performance profiling tool to support strategic positioning in Australian higher education. Drawing on data from qualitative semi-structured interviews and quantitative analysis of performance data, the study has provided insights into the ways the planning and monitoring of profiles can inform strategy formulation. Specifically, the empirical findings provide evidence that a performance profiling tool could be used by senior management to identify and understand institutional mission and strategy, setting a target or benchmark, and selectively choosing indicators for management and quality enhancement purposes. In doing so, it provides the link between research and the advancement of educational outcomes through providing evidence to support strategic decision making in areas such as learning and instruction.

Do college students spend more time studying when assignments are interesting?

Keywords: Educational Psychology, Higher education, Motivation, Quantitative methods

Presenting Author: Martijn Meeter, VU University Amsterdam, Netherlands

Over the last decades, many programs in higher education have moved away from a reliance on frontal lecturing, towards a system with small seminars in which assignments are handed out that structure self-study. Assignments are intended to motivate students to master the material programmed for that week, and are therefore constructed to be interesting. However, does an interesting assignment really result in more self-study? This question has up to now been tackled by for example comparing ratings at a course level where causality is difficult to establish - for one because such ratings confound true effects of interest in a course with individual differences between students in that course. To get at a more granular level, a study was conducted in which students in a large bachelor's psychology program rated their interest in assignments, and reported the subsequent self-study in the interval in between two face-to-face meetings. Although there was considerable variance in both the interest in the assignments and in reported hours of self-study, there was virtually no relationship between the two when assessed within students. Instead, self-study only increased nearer to the exams. Across participants, however, there was a correlation between the average interest in the assignments and self-study. This suggests that any relation between interest in assignments and self-study may result more from individual differences between students (e.g., differences in intrinsic motivation or in self-control) than from an any strong influence of interest on self-study.

A longitudinal study of reciprocal effects of participation and achievement in science classrooms

Keywords: Quantitative methods, Science education, Teaching / instruction, Video analysis

Presenting Author: Benjamin Caspar Fauth, University of Tübingen, Germany; **Co-Author:** Jasmin Decristan, Goethe-University Frankfurt; IDeA-Research Center, Germany; **Co-Author:** Mareike Kunter, Goethe-Universität Frankfurt, Germany; **Co-Author:** Gerhard Buettner, University of Frankfurt, Germany; **Co-Author:** Eckhard Klieme, German Institute for International Educational Research (DIPF), Germany; **Co-Author:** Ilonca Hardy, Goethe-Universität Frankfurt, Germany; **Co-Author:** Csaba Kurucz, Goethe-University Frankfurt, Institute of Psychology, Germany; **Co-Author:** Eva Lena Heide, Goethe-University Frankfurt, Institute of Psychology, Germany; **Co-Author:** Franziska Locher, University of Bamberg, Germany; **Co-Author:** Bianka Troll, Leuphana University of Lüneburg, Germany

Student participation in classroom discourse is considered a vital element of student learning. Students who participate in content-related discourse tend to be more engaged in learning, and teachers may provide better individual support by using on-the-fly assessment strategies to diagnose and scaffold student learning. However, we know little about the mechanisms of connection between participation in classroom discourse, student characteristics, and learning outcomes (e.g., Flieller, Jarlégan, & Tazouti, 2016). We used data from a longitudinal study in primary school with a standardized science curriculum and pre-and post-assessments of 681 students as well as video recordings in each of the 37 classes. We coded a ten-minute video sequence involving 893 verbal teacher-student interactions during a whole-class discussion on science content and matched the coding with student data. Logit regression analysis reveals that students' prior conceptual understanding in particular was connected with participation in classroom discourse on content. Furthermore, multi-level regression analyses indicated that students' participation within classes predicted conceptual understanding after the

science lesson. Moreover, students with relatively higher prior conceptual understanding when compared to their classmates benefited particularly from participation in classroom discourse. The results underline the benefits of students' participation in classroom discourse for science learning. Further analyses are needed to disentangle the underlying mechanisms (e.g., do particularly high-achieving students initiate participation and/or do teachers particularly address high-achieving students in classroom discourse), and further lesson sequences will have to be coded to examine the generalizability of our results.

Using classroom videos and student surveys to measure teaching practice

Keywords: Quantitative methods, Survey Research, Teaching / instruction, Video analysis

Presenting Author:Kirsti Klette, University of Oslo, Norway; **Co-Author:**Marte Blikstad-Balas, University of Oslo, Norway;

Co-Author:Astrid Roe, University of Oslo, Norway

Research suggests that multiple methods and sources of information are required when analyzing teaching practice, because teaching is too complex for any single measure of performance to capture accurately (BMGF, 2013; Klieme et al., 2009; Taut & Rakoczy). In the present study "Linking Instruction and Student Achievement" (LISA) we use video recordings from mathematics and language-arts classrooms together with student perception surveys and score gains on national tests to understand how instructional practices impact student learning and are able to differentiate between more and less effective instructional practices. In this paper we will report from the use of video recordings and student perception surveys as measures into teaching quality. Based on video recordings from 48 language arts classrooms and 48 mathematics classrooms (four lessons in each classroom, in total 396 lessons) and student perception surveys (n=1125 mathematics students and n=1100 language arts students) from the same grade 8 classrooms we discuss the validity and predictive power of the two measures. Analyses suggest that both student perception surveys and classroom observation can provide meaningful feedback on teaching quality when carefully designed student perception surveys provide valuable and reliable information on classroom teaching. The large and consistent variation between the survey items implies for example that Norwegian grade 8 students were able to discriminate between what they consider effective and less effective teacher actions. Video observations seem less fitted for differentiating between high quality and low quality teachers but seem to have a greater potential for diagnostic and developmental purposes.

Teacher Practices, Student Participation, and Learning: Variation across Classroom Structures

Keywords: Mathematics, Peer interaction, Teaching / instruction, Video analysis

Presenting Author:Noreen Webb, University of California, Los Angeles, United States; **Co-Author:**Marsha Ing, University of California, Riverside, United States; **Co-Author:**Megan Franke, University of California, Los Angeles, United States; **Co-Author:**Joy Zimmerman, University of California, Los Angeles, United States; **Co-Author:**Nicholas Johnson, Orange County Department of Education, United States

Researchers, policy makers, and practitioners increasingly recognize that engaging students as active participants in classroom conversations (explaining their thinking and engaging with others' ideas) is important for their mathematics learning. Emerging research also suggests that teachers can support student participation by pressing students to clarify and elaborate on their own ideas and to engage with others' ideas through questioning and challenging. Much of this research, however, is based on observations of teachers and students in only selected participation structures within classroom lessons, such as only whole-class discussion, or only small-group collaborative settings. This study examined teacher practices and student participation, and the relationship with student learning outcomes, in a wide range of classroom participation structures, including whole-class discussion, private student-student conversations during whole-class discussion, and student-led small-group work. The results showed wide variation across participation structures, suggesting that comprehensively observing student participation and teacher support practices in the multiple classroom structures that occur is necessary to draw valid conclusions about the links between teacher practices, student participation, and student learning outcomes. Focusing on only some of the classroom structures would provide an incomplete picture of both student participation and teacher practices.

Developing Stages of Tasks of Teaching Mathematics by Using a Content-Specific Instrument

Keywords: Mathematics, Teacher Effectiveness, Teacher Professional Development, Teaching / instruction

Presenting Author:Charalambos Charalambous, University of Cyprus, Cyprus; **Presenting Author:**Marina Kenti, University of Cyprus, Cyprus; **Presenting Author:**Evridiki Kasapi, University of Cyprus, Cyprus; **Presenting Author:**Kassandra Georgiou Foivou, University of Cyprus, Cyprus; **Co-Author:**Sofia Agathangelou, University of Cyprus, Cyprus; **Co-Author:**Maria Papacharalambous, University of Cyprus, Cyprus

While teacher observation instruments were initially conceived of as tools for teacher summative evaluation, recently they are considered as key levers for supporting teacher growth. To function in this formative way, different stages of tasks of teaching ought to be developed, so that areas for teacher improvement can be outlined. By capitalizing on the *Mathematical Quality of Instruction* (MQI) instrument, in this study we explore whether stages of tasks of teaching mathematics can be developed. Toward this end, we recruited 38 volunteer teachers (Grades 4-6) who had six of their mathematics lessons videotaped. All these lessons were coded independently by trained raters who then met to reconcile their work. Based on these reconciled codes and using a Rasch model, we first developed a scale with good psychometric properties that rank ordered the MQI items based on their difficulty level. These items were then clustered into five main stages employing a procedure for detecting pattern clustering. Based on this clustering, it appears that at the basic level

teachers are featured just ensuring that their teaching focuses on mathematics, is error-free, and engages students in procedural work. Teachers are then featured using more accurate mathematics language and engaging students in somewhat more demanding work. The third stage is characterized by richer and more challenging instruction as well as more productive interactions with students; in the latter two stages behaviors associated with the highest levels of the MQI are observed. We discuss how these findings can support teacher training and professional development.

The purpose of this paper is (1) to present the effects of intervention programs (IPs) on the amount of moderate- to vigorous physical activity (MVPA) in children four years of age and (2) to explore whether the IPs each Kindergarten has individually developed and implemented is associated with changes for MVPA from T1 to T2 (4 months). The term physical activity play is in this presentation used synonymous with MVPA. This longitudinal study includes data from 96 children in 11 public kindergartens (6 intervention; 5 controls). A start-up seminar and 3 courses (3 hours each) were conducted with the entire staff in the intervention kindergartens. The aim was that the staff at each institution systematically develop and implement measures tailored to their particular institution in order to increase physical active play. Staff (n=60) was followed up by during the entire project period (4 months) through visits in their institutions. Children from IG increased their MVPA twice as much than children in the control group (15,3min (SD=19) and 7.2 min (SD=15) respectively; p

Narrativity and Narratives in a Musical Playschool Teacher's Pedagogy

Keywords: Arts, Case studies, Early childhood education, Teaching / instruction

Presenting Author: Kyllikki Rantala, University of Tampere, Finland

The objective of this study is to examine how narrativity manifests itself in music education. The study sets out to find how and what types of narratives are used in musical playschool pedagogics.

This is a case study in which the phenomenon was examined in light of the educational methods used in one musical playschool group. The main data consists of videotaped teaching situations and interviews with the teacher.

The data were evaluated using theory-based analysis. In this case study, narrative first seems to be a conscious and target-oriented activity that uses narratives to direct children's attention to educational content and, context allowing, to musical learning as well.

Narratives seem to include three groups: tasks related to identity, community, and topics being taught in relation to one's experiences and life course. This last finding exhibits narratives in more detail. At the heart of the teacher's narratives lie the problem to be solved, emotions, and the identification of emotions. Caring and seeking for safety are the main emotions categorized according to Myllyniemi (2004). The extent of the narrative varies from a short sentence to a narrative permeating the whole class or a continuum of narrative across classes.

The last finding shows that pedagogics is seen as comprehensive and harmonizing.

Based on my data, narrative pedagogics is very well suited to early music education and many others areas.

A Pre-Literacy Intervention Study in a Multilingual Setting

Keywords: Cognitive development, Developmental processes, Early childhood education, Literacy

Presenting Author: Cyril Wealer, University of Luxembourg, Luxembourg; **Co-Author:** Silke Fricke, University of Sheffield, United Kingdom; **Co-Author:** Pascale Engel de Abreu, University of Luxembourg, Luxembourg

Phonological awareness and letter-sound training in a language-rich environment is effective in preparing children for literacy in alphabetic languages (Rose, 2006). However, the effectiveness of such approaches is not established for

children who are introduced to literacy in a second language. Preschool in Luxembourg is compulsory for all children and is conducted in Luxembourgish. Literacy instruction does not begin until Year 1 of primary and is conducted in German, the second language for 98% of the children. National statistics show that almost half of Luxembourg's nine-year-olds are not achieving national reading standards at the age of 9 (NSSA, 2012). This project aims to develop and evaluate the effectiveness of a theoretically motivated preschool literacy programme designed to systematically build up children's phonological awareness skills and letter-sound knowledge in Luxembourgish. The programme is administered by teachers and specifically designed to promote cross-linguistic transfer effects from Luxembourgish (L1) to German (L2 and language of literacy instruction) and to target the need of language minority children (roughly 50% of the sample). Two hundred children from 8 Luxembourgish preschools were allocated to either the intervention or the control condition (receiving the standard curriculum). The intervention runs for 12 weeks in Year 2 of preschool. Children are followed longitudinally and assessed on various language measures (phonological awareness, RAN, letter-sound knowledge, oral language) before and immediately after the intervention and 6 months after the end of the intervention. Preliminary data from the pre- and post-tests on the phonological awareness, letter-sound-correspondence and reading measures will be presented.

Enhancing Physical Activity in Taiwanese Early Childhood Education and Care

Keywords: Communities of learners, Developmental processes, Early childhood education, Teacher Professional Development

Presenting Author:Jyrki Reunamo, University of Helsinki, Finland; **Co-Author:**Li-Chen Wang, Chang Gung University of Science and Technology, Taiwan; **Co-Author:**Hui-Chun Lee, Tzu Chi University, Taiwan

We have conducted 16,846 systematic observations in Taiwanese preschools in 2015. One of the observed items was children's physical activity (PA). Only 6.1% of the children's activities included high PA with at least some running, romping and physical exertion etc. This means that Taiwanese preschool children do not have enough PA during the school day. We have shared the research results with 15 preschools in Taipei County and Hualien area. The teachers in each preschool have produced plans and models to enhance children's PA in their preschool and also shared the plans and ideas with each other. In this presentation we describe the results of children's PA that need pedagogical attention in the Taiwanese preschools. We also describe examples of the ideas and enhancements produced by the teachers based on the research results.

SEN students, self and teacher perceptions of school performance: Relation with classroom ecology

Keywords: Peer interaction, Social aspects of learning and teaching, Special education, Motivation and emotion

Presenting Author:Joana Pipa, University of Lisbon, Portugal; **Co-Author:**Fátima Silva, Agrupamento de Escolas Dr. Azevedo Neves, Portugal; **Co-Author:**Sofia Freire, Instituto de Educação da Universidade de Lisboa, Portugal; **Co-Author:**Cecília Aguiar, ISCTE-Instituto Universitário de Lisboa, Portugal; **Co-Author:**Francisco Vaz da Silva, Escola Superior de Educação de Lisboa, Portugal; **Co-Author:**Maria João Mogarro, Instituto de Educação da Universidade de Lisboa, Portugal; **Co-Author:**Aurízia Anica, Escola Superior de Educação e Comunicação – Universidade do Algarve, Portugal

Preserving one's positive perception of competence is a central feature in the educational process, being a desirable outcome and a positive mediator of students' school achievement and motivation. The main goal of this study was to evaluate student self and teacher's perception of school performance in accordance to students SEN status and classroom social structure. Participated 27 teachers and 359 students (48 SEN students) from Portuguese schools attending to 3rd, 5th and 7th grades. Teachers and students completed a rating scale of perception of school performance in general and in Portuguese and Mathematics subjects and students also completed two sociometric tasks to assess classroom social ecology. Results showed that SEN students revealed lower self-perceptions of performance than those of their non-SEN classmates. Teacher-SEN students perceptions of performance shared little consensus. Considering classroom social dynamics and structure, the results showed that social acceptance was a positive predictor of perception of performance. Also, classrooms with a more hierarchical structure lead to a low dispersion of classroom perception of school performance. These results reinforce the need to focus on SEN students as a particular vulnerable group and highlight the relevance of classroom's social ecology in constructing and maintaining students' self-perception of competence.

Exposure to multimedia features in e-book for promoting literacy among students with ADHD

Keywords: E-learning / Online learning, Learning and developmental difficulties, Special education, Writing / Literacy

Presenting Author:Ravit Grumberg Vardi, Bar-Ilan University, Israel; **Co-Author:**Adina Shamir, Bar-Ilan University, Israel

The purpose of the present study was to investigate the effect of activity with an educational electronic book (e-book) on literacy acquisition of students with and without symptoms of ADHD, as well as to assess the contribution of multimedia features integrated in e-books to the participants' literacy acquisition. The study participant population comprised 160 2nd grade children, 60 of whom showed symptoms of ADHD and 100 did not. All participants were administered a screening test followed by literacy tests, namely, dictation, word recognition and vocabulary tests. The sample was randomly assigned to 4 groups in the form of e-book with highlighted text and a narrator, e-book with highlighted text, a narrator and a dictionary, e-book with highlighted text, and a static book. Each group was exposed to the e-book 3 times. Upon completion of the exposure process, the participants were tested again, given the literacy test as well as a reading comprehension one. The findings demonstrated significant differences in the word recognition test between the children exposed to the e-book with narrator combined with highlighted text and dictionary and those presented with the static book. The most significant difference between ADHD students and children without ADHD was found in the vocabulary test. In the reading comprehension test, the results of children with ADHD were the same as those of children without ADHD, and those who were exposed to the e-book with narrator and highlighted text had the most significantly higher scores in both populations.

Valid test scores of problem-solving competence and their use for final exams in vocational education

Keywords: Assessment methods and tools, Problem solving, Technology, Vocational education

Presenting Author:Felix Walker, Technical University of Kaiserslautern, Germany; **Co-Author:**Leo van Waveren, Technical University of Kaiserslautern, Germany

We examine whether it is possible to validly measure domain-specific problem-solving competence as assessed in the final exam using computer based assessment (CBA) (e.g. computer-simulations) for the occupation of electronics technicians for automation technology (ETAT). We assume that there is no difference between the competence as assessed in the final exam and in the computer-based environment. To test this hypothesis, we drew a sample of 308 ETAT attending the German dual apprenticeship track. The apprentices worked on eight real-life problems (troubleshooting-scenarios). To compare the computer-based and real-life (troubleshooting on a real automation system similar to the final exam) assessment, we created two groups: one group solved problems one to four in real-life, and problems five to eight computer-simulated; the second group solved the items vice versa. The data were analyzed applying a multigroup-structural-equation-approach and confirmed our hypothesis. As a second step we tested how high the correlations.

Enhancing pro-social ability among HFASD children with computer mediated intervention

Keywords: Computer-assisted learning, Educational Technology, Social interaction, Special education

Presenting Author:Sigal Eden, Bar-Ilan University, Israel; **Co-Author:**Atara Oren, Bar-Ilan University, Israel

ASD (Autism Spectrum Disorder) is a congenital neurodevelopmental disorder, whose symptoms are expressed in two central categories: persistent deficits in social communication and interaction, and repetitive patterns of behavior with limited interests and activities (APA, 2013). The children who participated in this study are high-functioning (HFASD). The research deals with the social aspect of the disorder and focuses on pro-social behavior, defined as the ability to channel positive feelings and behaviors toward others to their benefit (Eisenberg, 1992). The goal of the study was to determine whether there is a gap between children with HFASD and children with typical development in their ability to exhibit pro-social behavior, and to compare pro-social behavior between children experiencing a computer-mediated intervention and a non-computer-mediated intervention. The study was conducted among 58 preschool children, ages 4-7. The group of children with HFASD was randomly divided into two groups: one group experiencing computer-mediated intervention and the other group experiencing a non-computer-mediated intervention. The two months intervention was based on the Cognitive Behavioral Therapy (CBT) model, combining cognitive learning with active experience. Before the intervention findings indicate gaps in the pro-social abilities of children with HFASD and children with typical development. However, after the intervention the gap between the two decreased. Comparing the two HFASD interventions groups, the computer-mediated intervention group improved in some pro-social measures compared to children with typical development.

Bayesian statistics in educational research – A look at the current state of affairs

Keywords: Educational policy, Meta-analysis, Quantitative methods, Researcher education

Presenting Author:Christoph Koenig, Friedrich Schiller University Jena, Germany; **Co-Author:**Rens van de Schoot, Utrecht University, Netherlands

The ability of a scientific discipline to build cumulative knowledge depends on its predominant method of data analysis (Schmidt, 1996). A steady accumulation of knowledge requires approaches which allow researchers to take into account results from comparable prior research. Bayesian statistics are especially relevant for establishing a cumulative scientific discipline, because the incorporation of prior knowledge is fundamentally anchored in its basic principles. Despite a considerable increase in attention in other disciplines (e.g., psychology), Bayesian statistics have not been the focus of recent reviews in educational research. The aim of this review is to provide insights into the current state of methodological affairs in educational research, with a focus on Bayesian statistics and the use of prior information. An analysis of publication histories of the 224 educational journals currently listed in the Thomson Reuters Journal Citation Report (Thomson Reuters, 2015) indicates that Bayesian statistics are primarily used to solve methodological problems (e.g., the estimation of complex models), rather than used to answer substantial research questions. Motivations for using Bayesian statistics indicate that Bayesian statistics are used to advance the methodological repertoire of educational research, as well as to produce knowledge which would not have been available with frequentist approaches. Lastly, the predominant use of noninformative prior distributions indicates that one of the biggest advantages of Bayesian statistics, although generally recognized, remains underutilized in educational research. Practical implications of these findings for educational research are illustrated and discussed.

Explaining halo effects in students' evaluation of teaching quality

Keywords: Assessment methods and tools, Quantitative methods, Survey Research, Teacher Professional Development

Presenting Author:Sebastian Röhl, University of Education Freiburg, Germany; **Co-Author:**Wolfram Rollett, University of Education Freiburg, Germany

Academic literature on the quality of teaching often reports a distorting halo effect, which is reflected in high correlations between various dimensions of quality of teaching (for example, Wagner, 2008; Clausen, 2002). This study examines if the halo effect can be explained by the teacher-appreciation perceived by the students as well as by the students' subject-specific interest. The sample consists of $n=860$ students in 41 classes from different types of German secondary schools. Analyses are done using structural equation modelling on individual and class level. Indeed, the results indicate a high importance of the perceived teachers-appreciation for the halo effect. The subject-specific interest shows a smaller effect which can only be observed at the student level. These findings seem to imply that considering the perceived teacher-appreciation might be necessary to take difference in this factor into account when measurements of teaching quality are based on student surveys.

Assessments and Accountability in Secondary Education: International Trends in Educational Policies

Keywords: Assessment methods and tools, Educational policy, School effectiveness, Secondary education

Presenting Author:Janna Teltemann, University of Hildesheim, Germany; **Co-Author:**Nina Jude, German Institute for International Educational Research (DIPF), Germany

A main focus of recent educational reform projects, which is also promoted by the OECD PISA study, is the targeted use of regular assessment and test-based accountability measures in schools and education systems. It is assumed that countries increased the use of assessments for purposes of teacher and school accountability and that, over time, countries become more similar with regard to their models and types of monitoring and evaluation of education. However, systematic empirical evidence on the prevalence and purposes of assessments is scarce. This paper describes national evaluation and monitoring systems in education and their change in implementation over time. This is achieved by classifying all past and recent PISA items focusing on assessment and accountability into the existing theoretical categorizations of evaluation and monitoring systems in education. First analysis for data from PISA 2000 to 2012 show that there is no clear trend of an increased use of assessment and accountability practices. The presentation will include latest results from PISA 2015 to be published in December 2016.

Individual and school-related factors which determine academic performance among at-risk students

Keywords: At-risk students, Primary education, Quantitative methods, Motivation and emotion

Presenting Author:Dóra Fanni Szabó, University of Szeged, Hungary

Research on educational resilience has increased considerably over the last decade and produced various understandings and explanations among success of students' who performed well in school, despite the presence of disadvantaged socio-economic background. This study investigated the factors and conditions that could help more students succeed at school despite challenging socio-economic backgrounds. The main purpose of this study is (1) to identify resilient students based on school performance in different school subject, (2) to explore the applicability of a resilience model, which comprise factors related to the self and attitudes toward school and learning, (3) to contribute to the development of a reliable online instrument, which appropriate to identify the protective factors among primary school students. Based on previous studies it is anticipated that findings will reveal a positive relationship between the investigated factors and performance. Participants were 96 Hungarian fourth grade students, all of them were socioeconomically disadvantaged. The students filled out a questionnaire, which contained five scale (general self-efficacy, school motivation, school attachment, academic self-

concept, persistence in learning). Preliminary results showed that the proportion of the resilient student is relatively high. Significant positive correlations between performance and investigated factors were reported. Self-concept and persistence were also a significant predictor of performance. The results of this study contribute to a more thorough understanding of the role of individual and learning-based factors among at-risk students. The implications of the findings are also discussed, and suggestions for future research are given.

Encouraging participation in cross-cultural group work: An RCT of local vs internationalised content

Keywords: Collaborative Learning, Cultural diversity in school, Higher education, Mixed-method research

Presenting Author: Jenna Mittelmeier, Open University, United Kingdom; **Co-Author:** Garron Hillaire, The Open University, United Kingdom; **Co-Author:** Bart Rienties, Open University, United Kingdom; **Co-Author:** Dirk Tempelaar, Maastricht University, Netherlands; **Co-Author:** Denise Whitelock, Open University, United Kingdom

With over four million international students studying globally, universities now have become unique spaces for cross-cultural exchange. At the same time, employers in many fields have expressed desires for graduates with cross-cultural competencies for careers in an increasingly globalised world. In response to these dual forces, many universities have attempted to internationalise their curriculums with an aim towards developing students' understanding of global citizenship and ability to interact in multicultural contexts. In this study, we considered one important component of an internationalised curriculum: the incorporation of globally-centred academic content in student assignments. Current research on this topic suggests that student participation and engagement with assignments may increase when academic content is internationalised. Yet, there have been no known studies that have unpacked the complexities of internationalisation by comparing students' behaviours and reflections when working with local (i.e. host) content versus internationalised content. To address this gap, we have conducted a randomised control trial study with 743 undergraduate students, who worked in small groups on a complex, authentic assignment using dynamic content from either the host country, their own country of origin, or an assigned country from which they are non-domicile. Interestingly, our analysis demonstrated a decrease in participation when content is internationalised, as well as strong barriers to positive cross-cultural learning experiences. At EARLI 2017, we will present the results of this analysis and discuss their implications for universities, educators, and students in the context of learning in diverse classrooms and contributing to globalised societies.

Dutch teachers on citizenship education in relation to their student composition

Keywords: Citizenship education, Cultural diversity in school, Secondary education, Social aspects of learning and teaching

Presenting Author: Isil Sincer, Erasmus University Rotterdam, Netherlands; **Co-Author:** Sabine Severiens, Erasmus University Rotterdam, Netherlands; **Co-Author:** Monique Volman, University of Amsterdam, Netherlands

Since 2006 Dutch schools are legally required to promote citizenship. As Dutch schools are becoming increasingly culturally and ethnically diverse, it is important to gain insight into the role of the student composition as regards citizenship approaches. Teachers may hold different views on and approaches to citizenship education, according to the student population in their classes. In this study, interviews were carried out with 16 Dutch secondary education teachers to explore what their views are on citizenship and how they approach citizenship goals. Teachers were selected from three schools across the Netherlands, varying by ethnic and socio-economic composition and educational level. The results of the study illuminate teachers' views regarding the student population, diversity and citizenship education and how the student population, explicitly or implicitly, is utilized in relation to the approach of citizenship goals.

The Validation and Exploration of the Chinese Culturally Responsive Teaching Self-efficacy Scale

Keywords: Cultural diversity in school, Language (Foreign and second), Self-efficacy, Teaching / instruction

Presenting Author: Wai Ming Cheung, The University of Hong Kong, Hong Kong; **Co-Author:** Yanli Huang, The University of Hong Kong, Hong Kong; **Co-Author:** Wing Yee W.Y. WONG, The University of Hong Kong, China; **Co-Author:** Hector W. H. Tsang, The Hong Kong Polytechnic University, Hong Kong

Background: The rapid growth of globalization and immigration pose great challenges to many countries and governments. Language learning is one of the greatest barriers faced by both immigrants and teachers. However, Hong Kong teachers have not been adequately trained to teach ethnic minority (EM) children. Aims: This study aims to (a) develop and validate

a Chinese scale of Culturally Responsive Teaching Self-efficacy (CRTSE) and (b) to examine Chinese language teachers' judgments of their capabilities to bring about desired outcomes of student engagement and learning in Chinese in multiethnic schools. **Methodology:** The original 40-item CRTSE was translated, revised to accommodate the subject-specific content and the local educational context. A total of 287 teachers from kindergartens, primary and secondary schools were recruited to complete the questionnaire. **Results:** Exploratory factor analysis showed that five factors accounted for 69.62% of the variability, which is consistent with the design of the scale. Overall, Hong Kong frontline teachers' total Chinese CRTSE mean score was 65.5. The highest mean score was attained for factor 2 "Efficacy to create positive and trusting relationship" followed by factor 1 "Efficacy to Accommodate Diversity" and the lowest score was factor 5 "Efficacy towards awareness of cultural difference". **Significance:** The results will provide a landscape to the government, researchers and educators on how to support teachers in teaching EM students. The Chinese CRTSE provided deeper insights on teacher's self-efficacy and on the provision of suitable effective professional development.

Examining tensions between achievement-oriented behaviour and cultural identity.

Keywords: Achievement, Case studies, Cultural psychology, Culture

Presenting Author: Emma Carter, University of Cambridge, United Kingdom

The past decade has witnessed further attention into educational initiatives targeting Indigenous students demonstrating high intellectual potential within Australia. These schemes have provided opportunities for students to leave their remote communities in order to pursue their education in urban centres. This paper presents an in-depth case study of one of these initiatives, 'The Academic Leader's Programme' (ALP), implemented by the Cape York Institute of Policy and Leadership. Principally, it examines the tensions that adolescent Indigenous students experience between their achievement-oriented behaviours and cultural identities. Methodologically, this study adopts a 'collective' case study design, focusing upon 7 Indigenous students. Using a grounded theory analytical approach, findings revealed the centrality of cultural identity for Indigenous Australian's sense of well-being within a community context. Students reported a number of interpersonal and intrapersonal issues related to their identification as both high-achieving students and indigenous Australians. Socially, students reported peer-group ostracisation upon leaving and returning to the community. According to Berry et al.'s (2006b) theory of acculturation, students were further found to adopt various profiles throughout their involvement including Diffuse, Ethnic, National and Integrated. In addition, students reported feelings of isolation, racism, anxiety and underachievement as a consequence of tensions arising between their achievement-oriented behaviours and cultural identity. Implications for research include the need for a review of recommended cultural identity models when working with high-achieving Indigenous students. Based upon findings, these should include include profile, rather than stage-based, approaches to the construct which explicitly incorporate the variable of achievement.

Gender differences in math: The role of psychological variables and teacher-student interactions

Keywords: Mathematics, Social aspects of learning and teaching, Student learning, Teaching / instruction

Presenting Author: Ana María Espinoza Catalán, Pontificia Universidad Católica de Chile, Chile; **Co-Author:** Sandy Taut, School of Psychology, Measurement Center MIDE UC, Pontificia Universidad Católica de Chile, Chile

The two studies presented here are inter-related and examine gender differences in the mathematics teaching-learning process in secondary mathematics classrooms in Chile. Chile, as other countries around the world, struggles with an important gender gap in favour of boys in mathematics achievement, especially in higher grade levels. The first study examines gender differences in longitudinal mathematics achievement pertaining to 1380 students from 43 7th grade classrooms, and how they relate to relevant psychological variables, and perceptions of their teachers, when learning mathematics. The results show differences in favour of male students in terms of math achievement, motivation, and self-concept. Also, after controlling for initial achievement, math self-concept and students' perceptions of teacher expectations are significant predictors of end-of-year mathematics achievement. The second study analyses 40 video-taped mathematics lessons, using a coding scheme focusing on gender differences in the amount and quality of teacher-student interactions. The results show that teachers, regardless of their gender, pose more questions at a higher cognitive level and give more feedback to male students than to female students, and that male students participate more in class, both

spontaneously and in responding to teachers' questions. The results are important input for educational policies on gender equity in Latin America and beyond.

The gains of teachers' interaction skills training? An international comparison

Keywords: Educational Psychology, In-service teacher education, Social interaction, Teacher Professional Development
Presenting Author:Markus Talvio, University of Helsinki, Finland; **Co-Author:**Minna Berg, University of Helsinki, Finland; **Co-Author:**Lauri Hietajärvi, University of Helsinki, Finland; **Co-Author:**Kirsti Lonka, University of Helsinki, Finland

Implementing 21st century skills at school, including social and emotional learning (SEL), has become increasingly important in many countries. This study investigated the development of teachers' readiness in promoting SEL. Internationally widely-used Lions Quest (LQ) was used as an intervention. The participants were 940 teachers from Finland, Italy, Japan, and Lithuania. Altogether 528 teachers who participated in the Lions Quest answered to the questionnaire before and after the training. The data of the comparison group (n = 412) not participating in the LQ were collected twice as well. The LQ inquiry consisted of two components, namely, how teachers perceived the significance of the goals, and their experienced competence in promoting the LQ goals. An exploratory factor analysis was conducted using data from the pre-test responses of first two countries. This analysis produced three factors. The created factor structure was further confirmed using pre-test data from another two countries. Repeated measures ANOVA (GLM) were used to examine the change between and within groups. After participating in the LQ the teachers perceived the importance of the LQ goals as more important and they felt more competent in implementing SEL skills in their classrooms. In addition, teachers valued the LQ higher after the workshop. In the comparison group no changes were found. The next phase of the study is to extend the study in six new countries. The universality of the LQ as a SEL program will be discussed.

The sociomaterial configurations of students' creative agency in school-based makerspaces

Keywords: Educational Technology, Qualitative methods, Social aspects of learning and teaching, Video analysis
Presenting Author:Kristiina Kumpulainen, University of Helsinki, Finland; **Co-Author:**Antti Rajala, University of Helsinki, Finland; **Co-Author:**Anna Mikkola, University of Helsinki, Finland; **Co-Author:**Sinikka Kaartinen, University of Jyväskylä, Finland

This paper discusses a study on the manifestation of students' creative agency in school-based makerspaces in two Finnish primary schools. By focusing on the temporal unfolding of sociomaterial configurations in students' maker activities, our study seeks to uncover how students' creative agency is shaped through the interplay between the creative intentions of students and the digital technologies and other sociomaterial resources of makerspaces. Our study holds that creative agency is a pivotal element of learning as it accounts for students' critical and generative engagement with novel problems and endeavors. The primary data comprise of 50 hours of video-records of students' (N: 100 students, aged from 10-12 years old) making activities collected intermittently over a period of one semester. Longitudinal, videodata details the micro and macro level dynamics of making activities in situ across time. The findings of the study illuminate how the students' achievement of creative agency was mediated by complex and nuanced sociomaterial configurations that encompassed not only the process of creating specific artefacts, but also making sense of operational, cultural and critical processes surrounding the maker activity situated across space and time.

Educational researchers and teacher educators: Learning to collaborate across boundaries

Keywords: Action research, Cooperative / collaborative learning, Researcher education, Synergies between learning - teaching and research

Presenting Author:Aleksander Baucal, University of Belgrade, Serbia; **Co-Author:**Francesco Arcidiacono, University of Teacher Education (HEP-BEJUNE), Switzerland; **Co-Author:**Äli Leijen, University of Tartu, Estonia; **Co-Author:**Nevena Budjevac, University of Belgrade, Serbia

This paper presents the main elements connected to the process of learning of educational researchers and teacher educators within the implementation of the project "REP-Synergy: Towards improvement of Research capacities essential for teacher Education and Practices in Serbia and Estonia". Participants were engaged in order to overcome existing identities and institutional boundaries connected to different scientific communities and to establish a productive collaboration through joint practice led research studies.

Through qualitative analyses, we identified the most important barriers (personal, identity and institutional ones) that prevent educational researchers and teacher educators to collaborate, as well as the ways they employ in order to establish a productive collaboration that will influence both educational research and teacher education. The results concerning these processes in Serbia and Estonia highlight differences in the main interests of participants coming from two professional communities, different perspectives in finding out models of research and teaching activities, and different identities that are supported by the institutional division. On another side, we also have identified key drivers of collaboration from the perspective of the researchers and of the teacher educators.

Session G 25

31 August 2017 08:30 - 10:00

Pinni A - A1081

Invited Symposium

Contextual influences on teachers' career choice and development in the profession

Keywords: Motivation, Pre-service teacher education, Quantitative methods, Teacher Professional Development

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Paul Richardson, Monash University, Australia

Discussant: Fani Lauermann, University of Bonn, Germany

A burgeoning literature in which the symposium presenters have been at the forefront, has begun to collectively establish the importance of teachers' motivations and motivational beliefs, for their own professional practice and wellbeing, and students' engagement and learning. Against a political backdrop of concern regarding teacher attrition and burnout in many countries including those in our Symposium, we focus on the role of the teacher education (opportunities to learn)/school environment (pressures/supports) in influencing and potentially modifying teachers' motivations and professional development ("PD": engagement/aspirations, self-efficacy, task values, burnout).

We aim to empirically investigate the role of individually and collectively experienced environments, in promoting (or undermining) teachers' optimal motivation and continuing development and wellbeing:

involving teachers from different countries (Australia/Austria/Switzerland/Israel) and career stages (cross-sectional/longitudinal), employing complementary theoretical perspectives (expectancy-value/achievement goal theories) and sophisticated methodologies (longitudinal/multilevel).

Findings reveal which motivations/PD dimensions were most influenced during teacher education/school employment, suggesting targeted levers (opportunities to learn in teacher education, basic needs satisfaction and school leadership in employment) to promote adaptive (and reduce maladaptive) outcomes. Unaffected motivations/PD were especially intrinsic/altruistic/mastery-related, implying lesser potential for enhancing or influencing those positive, seemingly more traitlike qualities.

Our Discussant will elaborate implications for theory, future studies, teacher professional development, teacher education and educational policy.

Contextual Influences on Beginning Teachers' Career Motivations and Career Choice Satisfaction

Presenting Author:Paul Richardson, Monash University, Australia; **Co-Author:**Helen Watt, Monash University, Australia

Little is known about the malleability of initial teaching motivations in response to early career school contexts. In a longitudinal study (teacher education commencement until early career teaching), we examined how initial motivations changed, and their dependency on school contexts. Participants were 493 Australian primary/secondary school teachers from the FIT-Choice project. Self-report surveys tapped teaching motivations (both timepoints), and school contexts during early career. Highest initial motivations were intrinsic value, perceived teaching abilities, positive prior teaching and learning experiences, and "altruistic" social utility values (Richardson & Watt, 2006). Other motivations included social influences, personal utility values (job security, time for family, job transferability) and teaching as a fallback career. Motivations were moderately stable (median $f=.43$). Excessive demands during early career did not moderate stability. Other school context factors were considered through the lens of SDT, emphasising satisfaction of three basic needs (autonomy, competence, relatedness). Motivation change scores were correlated against each context factor. Most influenced motivations were the social utility subfactor "work with children/adolescents" (positively), and, "fallback career" (negatively). Satisfaction with a teaching career was also highly malleable (positively). Given the previously identified influence of the positive motivation to work with children/adolescents, and, the negative motivation to teach as a fallback career, the formative role of school context during early career to support the former and reduce the latter, seem highly important. Other most positively influential teaching motivations, however (*ability, intrinsic value, make social contribution*), were robust to measured context factors, suggesting intrinsic sources and lower trainability.

Factors influencing early career teachers' professional plans: a longitudinal study in Austria

Presenting Author:Johannes König, University of Cologne, Germany; **Co-Author:**Martin Rothland, University of Siegen, Germany; **Co-Author:**Stefan Klemenz, University of Cologne, Germany; **Co-Author:**Sarantis Tachtsoglou, University of Cologne, Greece

Early career teaching is considered a crucial phase of teachers' professional development. This is particularly true in Austria as the context of our study, where elementary/lower secondary teachers face this challenge after a short 3-years Bachelor teacher preparation program. Thus our research aims at analyzing factors that influence the professional plans they report after their transition from training into teaching. For this, we use the PECDA instrument developed by Watt and Richardson, comprising four subscales: planned effort, planned persistence, professional development aspirations, leadership aspirations. We hypothesize that factors from three areas can serve as predictors: contextual factors of their school (e.g., school climate), institutional factors of their teacher preparation career (e.g., practical learning opportunities they had been exposed to during preparation), and individual factors (e.g., motivational and cognitive dispositions of their professional competence). Longitudinal data of $n=131$ early career teachers is used from the EMW study comprising three time points conducted when the teachers entered their preparation program (t1), when they were in their last year of teacher preparation (t2) and when they had started their second year as in-service teacher (t3). In the presentation we first report about the factor structure of the PECDA scales (German translation) which can be replicated for the Austrian sample. Intercorrelations are low showing subscales measure different facets of professional plans. Second, findings from

regression analysis show that contextual, institutional, and individual predictors have different effects on the subscales. Implications of findings and suggestions for future research will be discussed.

Identity development in Swiss vocational education and training teachers

Presenting Author: Zoe Morris, Monash University, Australia; **Co-Author:** Jean-Louis Berger, Swiss Federal Institute for Vocational Education and Training (SFIVET), Switzerland

This presentation will investigate the evolution of vocational teachers' professional identity in Switzerland based on the analyses of two survey studies. The first study ($n = 390$ vocation teachers; cross-sectional research design) will allow examining the association between several components of identity (strength of identity as a teacher, perceived expertise, self-efficacy beliefs, task value and perceived cost) and teachers' experience, career steps and certification. The second study ($n = 71$ vocational teachers undertaking teacher education; longitudinal research design) will show how teachers' professional identity evolves during a two-year teacher education program. In brief, the results reveal that a) the components of identity are non-linearly associated with teaching experience; b) teacher education impacts some components of identity such as perceived expertise in subject-matter and pedagogy and self-efficacy beliefs for instructional planning but not others (e.g., strength of identity as a teacher and self-efficacy beliefs for classroom management). Conjointly, the results of the two studies indicated that vocational teachers' professional identity is dynamic and malleable. The studies shed light on the multiple factors influencing the various components and their differential effects on teacher professional identity.

Context influences on teachers' motivation, self-efficacy & burnout: Do schools & principals matter?

Presenting Author: Ruth Butler, Hebrew University of Jerusalem, Israel; **Co-Author:** Limor Shibaz, The Hebrew University of Jerusalem, Israel

We applied an achievement goal approach to school leadership and a multi-level design to examine whether and how school contexts influence teachers' professional motivation, self-efficacy, and burnout. The first objective was to examine the prediction that teachers' achievement goals for teaching, self-efficacy, and burnout will differ significantly between schools. The second objective was to examine the proposal that school principals influence school-level teacher motivation and wellbeing. Extrapolating from achievement goal theory, we predicted that principals who exert pressure on teachers to achieve high student performance orient teachers to less adaptive ability and work avoidance goals for teaching and higher burnout, while principals who support teacher development will promote teacher mastery goals and self-efficacy and will reduce burnout. 650 teachers in 42 schools in Israel reported on their motivation and perceptions of the principal. Results confirmed that schools matter: there were significant between-school differences for all measures save mastery goals. They also confirmed that the principal matters. Principal performance pressure emerged as an important dimension of school leadership, with significant and adverse consequences for teacher motivation not only at the individual but importantly also at the school level. Principal support for teacher development predicted higher self-efficacy, and to some extent lower burnout, but not achievement goals. We discuss how findings contribute to understanding contextual influences on teacher motivation and challenge the motivational assumptions of accountability policy initiatives.

Session G 26

Invited Symposium

New measurements of professional learning: On the explanatory power of new data collection methods

Keywords: Assessment methods and tools, Biology, Cognitive skills, Cooperative / collaborative learning, Emotion and affect, Game-based learning, Informal learning, Motivation and emotion, Neuroscience, Quantitative methods, Social interaction, Workplace learning

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Hans Gruber, University of Regensburg, Germany

Organiser: Christian Harteis, University of Paderborn, Germany

Discussant: Erno Lehtinen, University of Turku, Finland

The symposium aims at discussing four selected data collection methods (i.e., fMRI; physiological skin measures; automated social interaction tracking; eye-tracking combined with automated facial expression recognition) regarding their explanatory power for researching professional learning. Recently, methods of data collection that go beyond traditional self-reporting receive increased attention, since the application of new measurements becomes more and more convenient. However, there is yet no agreement what these measurements can contribute to a better understanding of professional learning. The contributions present exemplary studies on learning applying new measurements and put their findings up for discussion. The aim of this session is that all contributions reflect the strengths and limitations of their measures and provide a statement on how informative their data can be for researching professional learning. The discussant will put up these statements and relate the presentations to the current state of research. Hence, the session reflects recent methodological issues and discusses opportunities to progress in the current state of research.

Sociometric badges and WiFi sensors: using wearable sensors to study dynamics of social learning

Presenting Author:Maaïke Endedijk, University of Twente, Netherlands; **Co-Author:**Piet Van den Bossche, University of Antwerp, Belgium

Social interaction at the workplace is at the basis of various forms of social learning, such as knowledge sharing, feedback giving and help seeking. Due to the dynamic nature of these processes, social learning at the workplace is extremely difficult to measure using self-report measures. Wearable sensors have opened a new world of possibilities to study the dynamic characteristics of social interaction in an innovative way. With the present studies, we aim to increase understanding of how sensor technology can be used to understand the dynamics of social learning.

We experimented with two types of sensor technologies to continuously measure social interaction. In one of the studies, we tracked the location of 48 employees of a health care department for three weeks, using WiFi-tags. In addition, sociometric badges were used during four days to measure social interaction and validate the WiFi-tags. Social network measures (density, centrality) were applied to calculate the dynamics of social interaction patterns and were related to individual characteristics, such as proactive personality. Our study contributes to the existing literature with more detailed and ecological valid insights on how day-to-day interaction patterns between employees evolve and how this is related to individual characteristics. During the presentation, we will show a number of possible applications of how sensor technology can be used to describe the dynamics of social interaction patterns as a proxy for social learning. Based on our experiences, will discuss the benefits, downsides and main challenges of sensor technology to study social learning at the workplace.

Developing methods for understanding the Role of Emotions in Agentic Learning at work (REAL)

Presenting Author:Anneli Eteläpelto, University of Jyväskylä, Finland; **Co-Author:**Päivi Hökkä, University of Jyväskylä, Finland; **Co-Author:**Susanna Paloniemi, University of Jyväskylä, Finland; **Co-Author:**Katja Vähäsantanen, University of Jyväskylä, Finland

In the REAL project, our objective is to determine how salient emotions are related to the quality of professional learning processes and outcomes. In addition, we aim to develop an innovative method for the on-line assessment of emotions within professional learning contexts. In previous studies of emotions, the limitations of self-reported data have often been noted, and it has been suggested that self-reports should be combined with observational and psychophysiological data. In the REAL project, we shall utilize complementary data collected via (i) self-reports and (ii) physiological indicators of the autonomous nervous system (ANS). Self-reports include interviews and on-line assessment of the quality and valence (positive, neutral, negative) of emotions, plus the learning processes and outcomes. The on-line assessments will be collected via a net-based Emotion Circle. The physiological data include electro dermal activity (EDA), collected via a net-based Emotion Ring. Data on heart rate variability (HRV) will be collected using simultaneous registration of various heart rate indicators. In the first stage, we shall use a stimulated recording procedure in which we play back to the participants the videotaped recordings of their group-based training sessions. At this point we shall ask them to evaluate their emotions within the videotaped training sessions using Emotion Circle as combined with thinking aloud, interviews, plus the registration of EDA and HRV. In the data analysis, we shall identify the most important emotions and investigate how they are related to the quality of the learning processes and outcomes.

How can neuroscience and education move forward together? Myths and opportunities

Presenting Author:Nienke van Atteveldt, VU University Amsterdam, Netherlands

Modern neuroscience research, including neuro-imaging techniques such as functional magnetic resonance imaging (fMRI), enables exploring the living human brain with unprecedented accuracy. Not surprisingly, these recent developments in neuroimaging raise high expectations in society, and in the educational practice in particular. The translation of neuroimaging research to the practice is however not straightforward and sensitive to misconceptions. For example, common myths are that we only use 10% of our brain, or the idea that learners are either “left-brained” or “right-brained”. Moreover, it is often wrongfully assumed that we can use brain scanners to “see” any kind of trait (e.g. intelligence) or disorder (e.g. learning or developmental disorders) in individual brains. To clear the field for the promising opportunities provided by neuroimaging research, it is essential to unravel such misconceptions, as they distract attention and resources away from the promising developments. In this presentation, I will set out which steps are involved in translating neuroimaging research to the educational practice, to enable presenting a realistic overview of misconceptions vs. the opportunities provided by techniques such as fMRI.

Error detection beforehand? Eye-tracking and face recognition for analyzing learning from errors

Presenting Author:Christoph Fischer, University of Paderborn, Germany; **Co-Author:**Torben Tönniges, University of Bielefeld, Germany; **Co-Author:**Birgitta Wrede, Bielefeld University, Germany; **Co-Author:**Christian Harteis, University of Paderborn, Germany

Since working life becomes complex and challenging, learning from errors is an important issue of professional learning. Learning from errors implies consternation and emotional reactions, otherwise cause analyses and reflection upon alternatives remain undone. The eyes are crucial sensors for information processing and the human face reflects emotional reactions. Hence, both are relevant sources for the investigation of learning from errors. On the basis of standardized video tasks, 20 subjects are repeatedly prompted to problem solving and conducting errors. Learning from errors is measured through the avoidance of the identical error in a repeated attempt. The experiments aim at investigating (a) if learning from

errors requires an emotional reaction, and (b) if gaze behavior and face expression presage committing an error. The first issue is relevant for the theory on learning from errors, the second issue is of specific relevance for human-machine interactions and the design of digitalized workplaces. Looking behavior is gathered by eye-tracking data (e.g. saccadic amplitudes) and emotional reactions are gathered through automated face recognition via video camera. The contribution reflects the reliability of eye-tracking and face-recognition data for analyzing professional learning processes.

Invited Symposium

Higher Education

Higher education teachers and teaching

Keywords: Higher education, Mixed-method research, Student learning, Synergies between learning - teaching and research, Teacher Professional Development, Teaching / instruction, Teaching approaches

Interest group: SIG 04 - Higher Education

Chairperson: Liisa Postareff, University of Helsinki, Finland

Organiser: Liisa Postareff, University of Helsinki, Finland

Organiser: Robert Kordts-Freudinger, Paderborn University, Germany

Organiser: Rike Bron, University of Twente, Netherlands

Discussant: Simon Barrie, Australia

Higher education teachers are facing demands to develop student-centred teaching practices with two goals: first, to engage their students to be active agents in the teaching-learning process and second, to improve the quality of students' learning outcomes. However, teachers often lack pedagogical competences, a fact that may be due to a strong focus on research productivity and to the fact that many have not attended pedagogical or faculty development activities. On this background, the symposium offers multiple viewpoints on the current challenges of higher education teaching, trying to view the topic from both the teachers' and the students' perspectives. The first two contributions focus on the use of student-centred and student-engaging teaching methods in promoting student learning and scientific thinking. The third contribution provides insights into barriers faced by mid-career teachers. The fourth contribution finally brings to front the students' perspective and shows the importance of positive relationships and emotions between students and teachers for the enhancement of deep understanding.

The contributions evidence the need for student-centred teaching practices, but also investigate the challenges faced by higher education teachers when creating positive relationships and meaningful interactions with their students. In addition, they highlight the active role of both teachers and students as well as the dynamic nature of the teaching-learning process. They also offer insights into teachers' professional satisfaction and the important role of emotions for the teaching-learning interactions.

Innovating pedagogical designs for student-centered learning: teachers' approaches and challenges

Presenting Author: Crina Damsa, University of Oslo, Norway; **Co-Author:** Rachele Esterhazy, University of Oslo, Norway;

Co-Author: Monika Nerland, University of Oslo, Norway; **Co-Author:** Heidi Hyytinen, University of Helsinki, Finland; **Co-Author:** Sari Lindblom, University of Helsinki, Finland

Pedagogies for student-centered learning have gained strong support in recent years. Still, little is known about the teachers' efforts and challenges when (re-)designing courses aimed to support active engagement and participation in learning activities. This contribution discusses findings from a mixed-methods study in four higher education courses in two Nordic countries, in the fields of biology, engineering and legal education. By way of interviews with teachers and students, observations of teaching and learning activities and a questionnaire to students, the study explored a) the teachers' approaches to innovate pedagogical course designs for student-centered learning and their experiences therewith and b) the students' experiences with the pedagogical design implemented in the courses. The findings indicate that the teachers were set out to support students to develop in-depth understanding of the domain knowledge, by outlining demanding activities and assignments. This was accompanied by experienced learning gains by students but also challenges. The complexity of the learning situation required increased guidance and support, as the students reported, and adjustments of the envisioned design, according to the teachers. Overall, the study provides relevant insights into pedagogical design aspects that matter for a meaningful learning experience, challenges experienced by both teachers and students, and implications for the educational research and practice.

Pedagogical training, use of engaging teaching methods and conceptions of scientific thinking

Presenting Author: Mari Murtonen, University of Turku, Finland; **Co-Author:** Heidi Salmento, University of Turku, Finland

The aim of this research was to examine what kind of conceptions university teachers have about the development of scientific thinking of their students and how these conceptions are connected to the amount of pedagogical training that the teachers have participated, and to the reported amount of use of engaging teaching methods in their teaching. The sample consisted of 101 teachers of one Finnish university, representing four faculties. The subjects were sent a questionnaire by paper mail, consisting of a question about their pedagogical training, 5 Likert-scale questions about use of engaging

teaching methods and 36 questions concerning the development of scientific thinking in students. Data showed that 43,9% of the teachers had taken part in pedagogical training while 56,1% did not have pedagogical training. The findings show that the teachers who had pedagogical training reported using more activating teaching methods (73,8%) than those teachers without pedagogical training (37,7%). A factor analysis was conducted on conceptions of the development of scientific thinking, revealing five sum variables, named: 1) Flexible thinking, 2) Mechanistic thinking, 3) Objectivistic thinking, 4) Methodological thinking, and 5) Expert thinking. There were statistically significant differences in teachers' conceptions of the development of scientific thinking when we looked at the groups who reported using plenty of engaging teaching methods and those not using so much engaging methods. Teachers who reported engaging their students much on lectures thought that scientific thinking is flexible and that understanding the process of science, e.g. research methods, is crucial for the development of scientific thinking.

Mid-Career Faculty: Trends, Barriers, and Possibilities

Presenting Author:Anita Welch, Ball State University, United States; **Co-Author:**Daniel Reardon, Missouri University of Science and Technology, United States; **Co-Author:**Jocelyn Bolin, Ball State University, United States; **Co-Author:**Rachel Stenger, Ball State University, United States

The purpose of this study is to examine an often overlooked period of academic life-that of the post-tenure mid-career faculty. According to data from the NSOPF, mid-career faculty, those with 12-20 years of teaching in higher education, comprise the largest segment of the academic profession. Although recent scholarship on this topic (e.g. Baldwin, Lunceford, & Vanderlinden, 2005; Austin, 2002; Boice, 2000) has identified numerous practices designed to aid the transition from pre-tenure to post tenure appointment, including mentoring, parental leave policies, and sabbaticals, scant comparable empirical evidence for the policies and practices related to post-tenure mid-career faculty can be found. What is known is that the largest and most important population of academia has been largely ignored by both researchers and policymakers. Therefore, the aim of this study is to deepen our understanding of the lives of mid-career faculty, with special focus on their productivity, and to suggest implications for future research on the subject. This study identifies factors related to the academic life of post-tenure mid-career faculty by analyzing trends and predicative patterns. This analysis will thus identify barriers to academic productivity and professional satisfaction. Our results indicate that productivity varies by career stage, and that the amount of scholarly productivity follows a downward trend beginning in mid-career. Overall job satisfaction declines during the mid-career period. Our study is significant in that it provides a base of information that can be used by faculty leaders, administration, and policymakers to transform their cultures and reexamine policies related to mid-career faculty.

Student's experiences of small-group teaching: 'Meeting of minds' in reaching personal understanding

Presenting Author:Noel Entwistle, University of Edinburgh, United Kingdom; **Co-Author:**Evangelia Karagiannopoulou, University of Ioannina, Greece

This study investigates students' perceptions of the teaching, experienced in small-group final-year classes in Greece, developing the idea of a 'meeting of minds' suggested in previous work (Karagiannopoulou & Entwistle, 2013). Twenty semi-structured interviews were carried out to investigate their perceptions of the teaching. Three categories were identified, one of which described a 'meeting of minds' in the learning relationship with the tutor. The second category saw teaching as encouraging understanding in other ways, while the final category described more pragmatic teaching, preparing students for the exam. Differing learning intentions were also found, again categorised into three groups, differing in the strength of the intention to understand for themselves. The study showed the powerful effect of experiencing a 'meeting of minds' in developing a personal academic understanding, but also indicated that this experience varied according to the students' learning intentions. The implications for quality of university teaching were then considered.

Symposium

Lifelong Learning

Informal learning in museums and exhibitions

Keywords: Arts, Comprehension of text and graphics, Educational Technology, Informal learning, Learning Technologies, Lifelong learning, Motivation, Out-of-school learning, Quantitative methods, Science education, Teacher Professional Development

Interest group: SIG 21 - Learning and Teaching in Culturally Diverse Settings

Chairperson: Doris Lewalter, Germany

Discussant: Susan Nolen, University of Washington, United States

There is growing interest in processes of learning and knowledge acquisition outside formal institutions, including informal learning settings like museums, exhibitions or zoos (Schwan, Grajal, & Lewalter, 2014). Accordingly, research in this field currently undergoes a substantial change from empirical evaluations of a certain exhibition to a more principled approach that is based on theories and methods of educational psychology. More specifically, according to the contextual model of museum learning (Falk & Dierking, 2013), processes of knowledge acquisition in museums result from an interplay of the

personal, the physical, and the social context of the visitors' museum experience. In the present symposium, the impact of the personal and the physical context on learning in museums will be discussed in four presentations. For the personal context, issues of visitor characteristics are of particular importance. Moser, Lewalter, Phelan and Schnotz present findings concerning the impact of visitor profiles on information processing, while Lewalter, Phelan and Bauer introduce a scale on visit motivation and present results for different informal learning settings. Regarding their physical context, museum exhibitions are increasingly supplemented by digital tools that aim to foster understanding by interactive access to additional material and explanations. Zahn and Vollenwyder report on an study about teachers' perspectives on the role of digital media for school class visits, while Schwan and Dutz describe an experiment how different types of visualizations on a mobile digital guide influence perception and comprehension of pictorial artworks in an exhibition. Nolan discusses the contributions based on her profound expertise on engaging learning environments.

The impact of visitor profiles on the processing of conflicting information

Presenting Author:Doris Lewalter, Technical University of Munich (TUM), Germany; **Co-Author:**Stephanie Moser, Technical University of Munich, Germany; **Co-Author:**Sielle Phelan, TUM, Germany; **Co-Author:**Wolfgang Schnotz, University of Koblenz-Landau, Germany

Museums are informal learning settings that present information to a very heterogeneous audience. They are increasingly taking on the challenge to present conflicting information (e.g., risk-benefit) in an effective and motivating manner. As we know from a multitude of psychological studies conducted in various educational settings that personality characteristics have an impact on information processing it is the aim of the presented study to investigate this relationship in the museum context. While the influence of recipients' personal characteristics has so far mainly been considered separately for each characteristic, we conducted a cluster analysis to identify visitor profiles in terms of combined personality traits that are assumed to be relevant for the processing of conflicting information (epistemological beliefs, tolerance of ambiguity, self-efficacy, interest, prior knowledge). This approach was chosen as for the museum practice, profiles of visitors and the frequency of their occurrence within the audience are more insightful than the frequencies of isolated personality variables as they better reflect the actual configuration of the audience. On the basis of data of 468 visitors four stable visitor profiles are identified. By calculating linear regression analyses we investigated whether belonging to a specific visitor profile has an impact on the processing of conflicting information. Results indicate significantly different influences of the four visitor profiles on the processing of conflicting information during the museum visit. The results are discussed regarding their implications for theory and research as well as possible consequences for practical educational work in the museum context.

Comparing visit motivation across educational leisure settings with a new short-scale

Presenting Author:Doris Lewalter, Technical University of Munich (TUM), Germany; **Co-Author:**Sielle Phelan, TUM, Germany; **Co-Author:**Johannes Bauer, University of Erfurt, Germany

In order to better understand motivational aspects of free-choice learning, a profound knowledge of people's visit motivation within and across educational leisure settings (ELS) is needed. We developed a short scale to enable quick and valid comparisons of visit motivation across educational leisure settings and investigated its dimensionality, reliability and measurement invariance across three sites (science museum, art museum, zoo; $N = 605$). Our 17-item short scale captures six theoretically important visit motivation categories with sufficient reliability ($p .65 < .85$). Analysis indicates an approximate scalar invariance of factor loadings and item intercepts, allowing for a comparison of latent factor means across sites. Subsequently, we found plausible mean differences in visit motivation dimensions across science museum, art museum and zoo. The implications for future research and theory as well as possible consequences for practical educational work in ELS are discussed.

Using multimedia guides to foster comprehension of pictorial artworks in museums

Presenting Author:Stephan Schwan, Leibniz-Institut für Wissensmedien, Germany; **Co-Author:**Silke Dutz, Leibniz Institut für Wissensmedien, Germany

Guiding viewers' attention in a picture is a prerequisite for successfully integrating additional verbal information into the picture's content, as research on multimedia learning has indicated. Therefore, the present study investigates the use of multimedia guides with audio narration and visual cues in an art exhibition and its effects on memory of pictorial elements and the perception of the artwork's principles of composition. We compared three different types of digital exhibition guides (audio guide vs. audio guide plus visual cues with a high resolution image vs. audio guide plus visual cues with a blurred image). 105 participants took part in the study. After the visit in the laboratory art exhibition and listening to 30 audio files on the multimedia guide in the three different conditions, participants were tested in a memory test about pictorial elements and the paintings' underlying composition principles. Results show that adding images with visual cues to an audio guide narration helps visitors to remember pictorial elements to which the audio narration refers, and to better comprehend the compositional principles. But this advantage comes at the cost of a decreased memory for further pictorial elements not mentioned in the audio guide. Whether visual cues are superimposed on high resolution or blurred images did not have a substantial impact on the results.

Teachers' Perspectives on the Role of Digital Media for School Class Visits to Science Museums

Presenting Author:Carmen Zahn, University of Applied Sciences Northwestern Switzerland, Switzerland; **Co-Author:**Beat Vollenwyder, Fachhochschule Nordschweiz, Switzerland

Research has shown that it is a highly demanding task for teachers to plan and carry out successful school class visits to science museums: Aside from dealing with logistical and organizational hurdles, teachers are also responsible for the trilogy of pre-visit preparation, the visit itself and post-visit follow-up activities that can foster their students' learning. Science museums increasingly provide digital media and tools in order to assist teachers in their planning and realization of school class visits, for instance, digital contents and mobile apps or virtual tours are offered for download from specific museum websites. The present visitor survey investigates *teachers' perspectives* on such support related to their own practices of pre-visit preparation, museum visit and post-visit follow-up activities. We obtained inquiry data from 195 teachers and calculated Fleiss κ in order to assess agreement among teachers. Results reveal that with fair agreement teachers considered museum-provided digital contents (e.g., from the website) important for pre-visit *preparation* and *post-visit activities*, while *during the visit* they would prefer mobile tools for both spatial orientation and "on-the-spot" pedagogical/didactic support. Generally, a positive attitude towards digital media and tools in the context of school class museum visits was clearly evident, underlining the potential for such applications.

31 August 2017 10:15 - 11:45

Main Building C - C8

Symposium

Temporal and adaptive process of regulated learning – what can multimodal data tell?

Keywords: Computer-assisted learning, Computer-supported collaborative learning, E-learning / Online learning, Educational Technology, Emotion and affect, Learning analytics, Metacognition, Multimedia learning, Problem-based learning, Self-regulation

Interest group: SIG 16 - Metacognition

Chairperson: Sanna Järvelä, University of Oulu, Finland

Chairperson: Maria Bannert, Germany

Discussant: Allyson Hadwin, University of Victoria, Canada

In self-regulated learning research (SRL) progress has been made evidencing that self-, co- and socially shared regulation of learning is critical for learning success as well as in explaining regulatory processes in today's increasingly social, interactive, and technology enriched learning situations. In conclusion, contemporary perspectives view SRL as a cyclical complex metacognitive and social process that involves adapting meta/cognition, motivation, emotion, and behavior. This is to say, regulation involves cyclical adaptation. It is neither static nor a state, but rather a series of contingencies over time. In other words, regulation evolves during learning. What is still not clear, is when those regulatory actions take place and how they influence each other. There is a lack of studies examining use and change of regulatory processes and types of regulation over time (temporality) as a variable in research about regulation. This is primarily because of the limited methodological ways to capture these evolving processes. The organizers of this symposium have been progressing the use of multimodal data in SRL research in their *EARLI Center of Innovative Research (E-CIR)* "Measuring and supporting students' SRL in adaptive educational technologies". The aim of the symposium is to discuss and share our empirical findings dealing with temporal and adaptive process of regulation while using multimodal measures.

Analysing Temporal Data for Understanding and Fostering Learning induced by Self-Created Prompts

Presenting Author: Maria Bannert, Technical University of Munich (TUM), Germany; **Co-Author:** Katharine Engelmann, Technical University of Munich, Germany

Research in self-regulated learning (SRL) demonstrates that learners often do not perform regulatory activities spontaneously, which results in lower learning outcome. Therefore, our research aims to provide instructional support for the activation of strategic learning processes during technology-enhanced learning utilizing students' self-created metacognitive prompts. In a pre-post experimental design, students in the experimental group ($n = 28$) were instructed to create their own metacognitive prompts before learning whereas students in the control group ($n = 29$) learned without prompts. Log file analysis of navigation behavior indicates that students who learned with their self-created prompts spent a longer time on relevant websites compared with students in the control group. Moreover, participants in the experimental group attained better comprehension performance. In the presentation we will focus on process mining techniques which we used to analyze temporal data in order to better understand student's learning induced by self-created prompts.

Examining the interplay of affect and self regulation in the context of clinical reasoning

Presenting Author: Susanne Lajoie, McGill University, Canada; **Co-Author:** Maren Gube, McGill University, Canada; **Co-Author:** Amanda Jarrell, McGill University, Canada; **Co-Author:** Shan Li, McGill University, Canada; **Co-Author:** Juan Zheng, McGill University, Canada

This study examines the relationship between self-regulatory activities and affect in the context of clinical reasoning in a computer based learning environment, BioWorld (Authors, 2013). We present a case study of high and low performing medical students to demonstrate the interplay between cognition, affect, motivation and self-regulation in a clinical problem solving context. The temporal nature of clinical reasoning was examined with a specific focus on how high and low performers handled uncertainty. In particular, we examined differences in the types of self-regulatory processes students enacted throughout the reasoning activity, and the emotions they experienced while diagnosing a patient case. Think-aloud

and log file analyses were used to code SRL using Meijer et al.'s framework (2006) that was adapted by Authors (2012) to classify both macro and micro levels of self-regulatory activities that pertain specifically to clinical reasoning. Affect was analyzed while students solved cases using behavioural data (through facial expressions). Achievement goal orientations (Elliot & Murayama, 2008) and habitual emotion regulation strategy use (Gross & John, 2003) were also assessed. We discuss the implications of these preliminary findings in terms of the validity and reliability of inferences made in relation to self-regulatory activities and affect.

Measuring, Analyzing, Inferring Temporally Unfolding Self-Regulatory Processes from Multimodal Data

Presenting Author:Roger Azevedo, North Carolina State University, United States; **Co-Author:**Michelle Taub, North Carolina State University, United States; **Co-Author:**Nicholas V. Mudric, North Carolina State University, United States; **Co-Author:**Garrett C Millar, North Carolina State University, United States; **Co-Author:**Amanda E. Bradbury, North Carolina State University, United States; **Co-Author:**Megan J. Price, North Carolina State University, United States

Understanding the complex nature of cognitive, affective, metacognitive, and motivational (CAMP) processes during learning with advanced learning technologies (ALTs) is key to understanding how these processes impact learning about conceptually challenging topics (Azevedo et al., in press). Current methodological and analytical approaches to studying SRL processes (e.g., self reports) have several weaknesses compared to capturing real-time deployment of SRL processes (see Molenaar & Järvelä, 2014). Our approach has been to use MetaTutor (an intelligent, hypermedia multi-agent ALT) to collect rich multimodal multichannel trace data of CAMP processes during learning (e.g., eye tracking, facial expressions of emotion). In this presentation, we focus on the challenges in measuring, analyzing, and inferring temporally unfolding CAMP self-regulatory processes during human-pedagogical agent (PA) interactions with MetaTutor. In our presentation we will present and discuss the methodological and analytical challenges associated with understanding and inferring the roles of CAMP processes by using examples from multichannel, multimodal data (e.g., log files, eye tracking, facial expressions of emotion, physiological data, and screen capture of learner-system interactions) collected from college students as they learned with MetaTutor.

How regulation evolves during collaborative learning ? – triangulation of multimodal dataset

Presenting Author:Sanna Järvelä, University of Oulu, Finland; **Co-Author:**Jonna Malmberg, University of Oulu, Finland; **Co-Author:**Márta Sobocinski, University of Oulu, Finland; **Co-Author:**Eetu Haataja, University of Oulu, Finland; **Co-Author:**Paul A. Kirschner, Open University of the Netherlands, Netherlands

Collaboration is not a snapshot of a task performance, but a progress in collaboration matters. In order to understand how regulation evolves during collaborative learning, research should inform students' strategic adaptation to the situated challenges and strategic regulation of cognition, motivation. The aim of this paper is to explore what multimodal data can tell us about SRL processes in authentic collaborative learning tasks. The study included high school students aged 15 to 16 ($N = 36$). The students worked in collaborative groups of three students in a total of 12 groups on the task of designing a "healthy breakfast" by using the WeSpot learning environment and following the principles of scientific inquiry. Data collection involved information from four data channels: observation data, two types of physiological data (electrodermal activity and heart rate), and facial recognition data processed from the video data. We will demonstrate what multimodal data can tell us about SRL processes in authentic collaborative learning tasks in terms of a) the adaptation and student's reaction to challenge situation, and b) how adaptation in collaborative learning evolves.

Higher Education, Lifelong Learning

Researching professional learning in changing epistemic environments

Keywords: Engineering, Higher education, Knowledge creation, Lifelong learning, Professions and applied sciences, Qualitative methods, Social interaction, Teacher Professional Development, Workplace learning

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Monika Nerland, University of Oslo, Norway

Discussant: Madeleine Abrandt Dahlgren, Linköping University, Sweden

Changes in how knowledge is produced and distributed transform professional learning in work as well as in educational settings. In this context, we need a better understanding of how epistemic shifts in the professional domains influence the micro-dynamics of education and learning in practice, and what such shifts imply for the ongoing learning and qualification of professionals. This symposium contributes to our understanding of professional learning today by comparing and contrasting how epistemic resources are provided and used in different fields of expertise. The four papers all employ sociocultural and material perspectives to examine professional learning in specific epistemic environments, but target different analytical levels and intersections of practice. Paper 1 presents results from an Australian project which compared how epistemic shifts in pharmacy, nursing, teaching, social work and school counselling generate new educational practices and requirements for learning in higher professional education. Paper 2 examines a specific aspect of epistemic environments in software engineering, i.e. how the provision of web-based knowledge resources stimulates object-related

learning in education and work. Paper 3 focuses on new epistemic resources in health care, and examines knowledge translation and learning among professionals dealing with chronic illness. Paper 4 examines changes in epistemic environments for work-based learning in the teaching profession by integrating findings from three related Norwegian studies carried out in the period 2004-2016. In sum, the symposium shows how professional education and learning is embedded in ongoing knowledge dynamics that span the education-work boundary, and suggest analytical approaches to research these relations.

Insights into the dynamics between changes in professional fields and teaching in higher education

Presenting Author:Lina Markauskaite, University of Sydney, Australia; **Co-Author:**Peter Goodyear, The University of Sydney, Australia

What counts as expert knowledge, and what is expected from knowledgeable practitioners are subject to continual change in professional fields. Consequently, professional education programmes are often challenged to ascertain their capacities to prepare “job-ready” graduates for such changing professional knowledge work. However, what is the nature of these changes and how they get incorporated into teaching and learning practices in university courses are rarely examined, so teachers running courses for professional education get little guidance about how it can be more clearly conceptualised, and done better. Our study focussed on “epistemic shifts” – observable changes in professional fields that bear on how professionals are expected to work with knowledge. We aimed to understand how recent epistemic shifts in specific professional fields were instantiated in assessment tasks in professional courses. We focussed on assessment tasks as these tasks give insights not only into what and how students learn, but also into what counts as “job-ready” graduates. Our detailed case studies came from five courses – in pharmacy, nursing, social work, school counselling and education. Our results show that the epistemic shifts varied in their transformative scale and in the ways they became incorporated in assessment tasks: from implicit incorporation of an ongoing flow of small shifts into established professional tasks, to introduction of new professional epistemic practices. The analytical framework we have constructed helps depict what is actually changing in students’ epistemic practices when assessment tasks are redesigned and what kinds of new epistemic capabilities students will consequently develop.

Students’ and beginning professionals’ learning with web-based resources in software engineering

Presenting Author:Monika Nerland, University of Oslo, Norway; **Co-Author:**Crina Damsa, University of Oslo, Norway

This paper examines how distributed knowledge resources in the field of software engineering provide opportunities for students and professional practitioners to set up learning opportunities for themselves. By using perspectives on artifact-mediated practices and knowledge construction as analytical lenses, we examine how learners in this field access versatile web-based knowledge resources, become involved in exploring and constructing knowledge objects, and pursue learning opportunities in deliberate and strategic ways as part of their local problem-solving activities. We draw on two empirical cases, one study of students’ project-based learning in computer engineering education and one study of novice engineers’ continuous learning in the context of engineering projects at work. Data comprises videotaped observations, learning logs, interviews, and documentation of tools and resources utilized in practice. Findings show how accessing distributed knowledge resources in both cases led to the participants’ involvement in object-related learning dynamics, which oscillated between opening new avenues for exploration and arriving at temporary closures. Moreover, the participants approached knowledge resources in deliberate ways and created learning opportunities for themselves through the ways resources were identified, attended to and examined. The resources served to link their practices with other sites and actors in the domain, which also stimulated further learning. However it varied how thoroughly the participants engaged with the knowledge resources. We discuss opportunities and challenges for learning provided in this environment, and suggest that models for professional education and learning should be reconsidered to support exploration along wider epistemic infrastructures and recognize self-initiated construction of learning activities.

Knowledge translation, professional communication and learning in the context of chronic illness

Presenting Author:Asa Makitalo, University of Gothenburg, Sweden; **Co-Author:**Mona Lundin, University of Gothenburg, Sweden

The epistemic work among professionals in the health sector is under transformation. Chronic diseases constitute a primary challenge for the sector and treatment of these call for technologies that can support a new relation with patients based on self-treatment and patient-generated data. In this study the aim was to analyse the implications of such self-treatment for professional epistemic work in hypertension care consultations. The data consists of 10 video-recorded consultations with professionals and patients after 8 weeks of self-treatment and reports through a mobile phone based system. Based on sociocultural and dialogical traditions the analysis focused on the in situ interaction with a focus on what epistemic orientations that emerged in the consultations as the data was visually displayed through graphs on the screen. Three orientations are reported: The system as a knowledge object, the system as a coordination device and the system as support in mediating professional and patient perspectives.

Epistemic shifts in teachers’ work and learning analyzed through three research projects

Presenting Author:Karen Jensen, University of Oslo, Norway; **Co-Author:**Eli Tronsmo, University of Oslo, Norway

This paper explores how the epistemic environments for teachers' work and learning are being reconfigured to meet new knowledge demands. The paper synthesizes and reviews findings from three empirical studies that examined Norwegian teachers' work-related learning, spanning a time period of twelve years. The studies were designed to build on each other, by following the same practitioners over time and by adding targeted case studies to investigate in depth questions emerging from the first study. Data was collected through questionnaires, interviews and learning logs (study 1 and 2) as well as through observations of knowledge practices and learning (study 2 and 3). A shared conceptual framework building on theorizations of professional knowledge cultures and artifact-mediated learning (Knorr Cetina 2001, Säljö 2010) was employed to analyze how professionals relate to and construct knowledge in everyday work, as well as how their situated enactments are linked with wider knowledge spheres. When synthesizing and reviewing the findings across the studies, we identify significant shifts taking place within the teaching profession. From a state in which teachers' learning were dominated by the sharing of personal experiences within the local workplace, the later projects documented an increased variety of knowledge resources which linked practitioners to larger knowledge networks. Moreover, teachers increasingly take on responsibilities for the epistemic basis for professional actions, by relating to and adapting knowledge-based standards and templates in everyday work. In doing so, they also become local knowledge producers. We discuss what these changes imply for continuous learning and development.

Teaching and Teacher Education

Professional Development in Dialogic Teaching: Commonalities and Constraints

Keywords: Argumentation, Communities of practice, Comparative studies, Qualitative methods, Quantitative methods, Quasi-experimental research, Self-efficacy, Social interaction, Teacher Professional Development, Video analysis

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Alexander Groeschner, Germany

Organiser: Alina Reznitskaya, Montclair State University, United States

Discussant: Jonathan Osborne, Stanford University, United States

The importance of classroom dialogue in supporting student learning has been recognized in numerous studies that span different school subjects, grade levels, and national borders (Alexander, 2008; Resnick, Asterhan, & Clarke, 2015). Educational researchers, policy-makers, and practitioners increasingly advocate dialogic teaching as a means of furthering students' development. Dialogic teaching is a general pedagogy that capitalizes on the power of talk to foster students' thinking, learning, understanding, and problem solving. Although research continues to demonstrate the pedagogical potential of dialogic teaching, it is still largely absent from today's classrooms. Further, only a few studies have systematically examined the features of professional development programs that can produce non-trivial and lasting changes in teacher's discourse practices and related student outcomes. The aim of this symposium is to examine professional development efforts that show promise for supporting teachers' implementation of dialogic teaching. Our discussion brings together researchers from multiple disciplines who propose various mechanisms of teacher change, use diverse approaches to professional development, and focus on different teacher and student outcomes. All proposals in this symposium use socio-cultural theories to frame advocated teaching practices as well as their professional development efforts. However, the authors expand these theories in a variety of ways, integrate them with other research traditions, and focus on the outcomes of professional development that range from quality of teacher and student talk to argumentation skills and self-efficacy. We examine the commonalities and constraints among different approaches, identifying more (and less) promising features of the programs.

Using Talk to Promote Argument Literacy: Effects of Professional Development in the Language Arts

Presenting Author: Ian A.G. Wilkinson, The Ohio State University, United States; **Co-Author:** Alina Reznitskaya, Montclair State University, United States; **Co-Author:** Min-Young Kim, The Ohio State University, United States; **Co-Author:** Ariel Sykes, Montclair State University, United States

In this paper, we report findings from the third yearlong iteration of a professional development program in dialogic teaching to promote students' argument literacy. We define argument literacy as the ability to comprehend and formulate arguments through speaking, listening, reading, and writing. The professional development program focused on helping teachers use a specific type of talk called 'inquiry dialogue' in classroom discussions about text to promote students' argument literacy. The program was delivered using a combination of workshops, study groups, and coaching sessions. Using a pretest-posttest experimental design, we examined evidence of growth in teachers' epistemological beliefs and enactment of discussions, and collected data on students' argument literacy and reading comprehension. Twenty-six fifth-grade language arts teachers, 14 in the experimental condition (professional development) and 12 in the control condition, and their students at two U.S. sites participated. Teachers made substantial shifts in their discourse practices and in the quality of argumentation in the discussions, though there was little apparent change in their epistemic beliefs. Some evidence of transfer to individual learning outcomes was observed.

Professional Development For Dialogic Teaching

Presenting Author:Robin Alexander, University of Cambridge, United Kingdom

This paper presents an account of progress to date on the joint Cambridge Primary Review Trust / Institute for Effective Education project *Classroom talk, social disadvantage and educational attainment: Raising standards, closing the gap*, funded by the UK's Education Endowment Foundation. The project's professional development programme aims to intensify the quality of classroom talk, teachers' as well as students', in order to increase engagement and improve attainment among students judged disadvantaged by government criteria. The approach builds on the notion of dialogic teaching, which emphasises a broad pedagogic/dialogic repertoire, and principles of procedure rather than specific talk formulae.

The strategy comprises a two-term reiterative programme of planning, target-setting and review using mentoring and video/audio analysis and structured into 11 fortnightly cycles. Trialled in 2014-15 in 10 London primary schools, it was subjected during 2015-16 to randomised control trial (RCT) in 72 schools in Birmingham, Bradford and Leeds. Alongside the RCT, the project team have undertaken their own process analysis using observation, interview and both quantitative and qualitative analysis of the teachers' lesson videos. The presentation will focus on outlining and reflecting on the project's rationale, methodology and strategy. It will also include a critique of the increasing colonisation of UK policy and research funding by the RCT as the supposed methodological 'gold standard,' showing how in a field as complex as classroom talk the viability of RCT is strictly limited.

Effects of Professional Development in Dialogic Teaching on Teacher and Student Self-efficacy

Presenting Author:Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Ann-Kathrin Schindler, Technische Universität München (TUM), Germany; **Co-Author:**Doris Holzberger, Technical University of Munich (TUM), Germany; **Co-Author:**Tina Seidel, Technische Universität München (TUM), Germany

Professional development (PD) programs in dialogic teaching often address dialogic moves and formats to change teachers' classroom practice and to scaffold student engagement. Scaffolding is a form of high quality support that may help to increase teacher self-efficacy. Similarly, students' self-efficacy may be promoted by high quality support of their teachers and may be relevant to the way students participate in classroom dialogue. To date, there is a lack of research investigating teacher learning in relation to both changes in classroom dialogue practice and the effects on teacher and student self-efficacy. This study contributes to this research by applying a quasi-experimental approach. Specifically, we investigated whether teachers and students in an intervention group (IG), who participated in an video-based PD program on classroom dialogue, improved their self-efficacy compared to a control group (CG) of teachers and students, who participated in a non-video-based PD approach. Quantitative instruments were administered to measure teachers' and students' self-efficacy. Qualitatively, a coding scheme was developed to capture changes in videotaped teaching practice and teacher verbal exchanges during PD workshops (IG only). The findings show a significant change in teachers' and students' self-efficacy in the IG. We suggest that the changes could be related to the IG teachers' practice of scaffolding, as scaffolding was directly addressed in a lesson planning workshop during PD intervention.

Developing Dialogic Pedagogy, Supporting Teacher Agency

Presenting Author:Alexander Groeschner, Friedrich Schiller University Jena, Germany; **Co-Author:**Adam Lefstein, Ben-Gurion University of the Negev, Israel; **Co-Author:**Benzi Slakmon, Ben Gurion University of the Negev, Israel

A key principle of dialogic pedagogy is respect for students' voice and agency, yet often attempts to promote dialogue through teacher professional development afford limited space for participating teachers' voice and agency. This paper reports on the design and initial progress of an initiative designed to facilitate teacher agency in experimenting with and appropriating dialogic practices. Key features of this programme include: learning on the job, as part of routine participation in work-groups; working with existing leadership and practices; quick feedback from research to practice; and deep partnership with the Ministry of Education and other partners. Drawing on interviews, surveys and audio-recordings of teacher team meetings and professional development workshops, the study explores (a) how the participating teachers are thinking about dialogic pedagogy, (b) what local practices they have developed, (c) central challenges encountered, and (d) design adaptations to address them. Emerging issues include gaps between the research team, Ministry of Education officials and teachers in our thinking about dialogue, and indeed in our goals for the intervention; different ways of appropriating and adapting dialogic pedagogy in the different cultural settings of Jewish and Bedouin schools; and the advantages and drawbacks of classroom video-recordings as a means of representing dialogic practice. The paper will contribute to comparative analysis of dialogic pedagogy across cultural contexts, to an appreciation of teacher agency and voice in appropriating dialogic pedagogies, and to a deeper understanding of the processes of informal teacher learning aimed at enacting dialogic practices.

Symposium

Context Effects in Learning and Instruction

Keywords: Attitudes and beliefs, Conceptual change, Educational Psychology, Higher education, Interdisciplinary, Language (Foreign and second), Mathematics, Motivation, Pre-service teacher education, Primary education, Qualitative methods, Science education, Secondary education, Teacher Effectiveness, Teaching / instruction

Interest group:

Chairperson: Mona Weinhuber, University of Freiburg, Germany

Organiser: Matthias Nückles, University of Freiburg, Germany

Discussant: Fritz C. Staub, University of Zurich, Switzerland

Context matters! Since the late 20th century, inspired by situated cognition approaches, analyses of contextual effects gained increasing attention in educational research. Researchers conducted in-depth analyses of authentic learning situations by observing teachers' and learners' actions in order to analyze potential effects of the context on distinct instructional practices (Brown 1992; Cobb et al. 2003; Collins 1992). Despite the valuable insights, however, processes of how context can shift mindsets and which factors influence such shifts are still under research. With this symposium we aim to contribute to this research field, by combining recent experimental and qualitative studies that provide evidence how instructional contexts affects students' learning and teachers' instructional practices. The first paper provides insight into how different language mindsets affect the way people perceive and interact with learners who fail a second language activity. The second paper presents results indicating that students adapt their conceptions of learning when entering a new context of learning. The third paper reports how different contexts influence the nature of math teachers' explanations. The final paper identifies contexts in which pre-service teachers are more and less likely to engage in responsive teaching practices. Together, the contributions to this symposium make up a coherent set of studies which shed light on how situational conditions may shape instructors' and learners' cognitive processes and thereby influence learning behavior and instructional practices.

Changing language mindsets influences beliefs towards and feedback given to language learners

Presenting Author: Nigel Mantou Lou, University of Alberta, Canada; **Co-Author:** Kimberly Noels, University of Alberta, Canada

Language mindsets refer to people's beliefs about whether language aptitude is malleable (i.e., incremental mindsets) or fixed (i.e., entity mindsets). Previous research suggests that a context that promotes incremental mindsets leads people to become more motivated and persistent in the face of challenges. This research examines whether language mindsets influence the type of feedback that people provide to language learners who fail a test in a language class. Two studies ($N = 258$) showed that holding or priming entity beliefs led Anglo-Canadians to attribute English learners' failure to a lack of language intelligence and thus, to provide consoling feedback to comfort for low competence (e.g., "don't worry, not everyone is good at language"), while holding or priming incremental beliefs led Anglo-Canadians to believe in English learners' potential to learn, and in turn to provide constructive feedback to improve competence. We conclude that promoting incremental mindsets may help people to become more effectively support language learners' developing competence.

How context influences pre-service teachers attending and responding to student ideas

Presenting Author: Leema Berland, University of Wisconsin-Madison, United States

Movements in science education increasingly emphasize responsive teaching practices in which teachers attend and substantively respond to their students' ideas. Existing literature examining these pedagogical practices seems to have conflicting findings; some work suggests it is extremely challenging for teachers while others demonstrate novices doing it from early on in their student teaching. We interpret these differences in findings as contextual, and our study explores the contexts in which pre-service teachers are more and less likely to reason with and about their student ideas while teaching. Preliminary analyses suggest that pre-service teachers are more likely to attend to the substance of students' ideas when interpreting them than when considering possible responses. Further, we find teacher attention becomes increasingly difficult as their context becomes increasingly similar to "real world" classrooms. We explore the implications in the full paper.

When learning becomes traveling. How metaphors of learning change when entering university

Presenting Author: Elisabeth Wegner, University of Freiburg, Germany

For successful learning, students need to adapt their conceptions of learning to the learning culture, especially when entering a new context of learning such as university. However, conceptions are usually implicit and thus difficult to assess. Metaphors have been proposed as a possibility to examine conceptions. Therefore, we examined how students' metaphors of learning ($N=30$) changed over the course of the first year of studies. Also, we analysed how the metaphors related to motivational aspects of learning.

Metaphors were more congruent with university learning culture in the 2nd year of studies than in the 1st year, and congruence of metaphors to university learning culture was related to perceived competence, indicating that students adapt their conceptions of learning when entering a new context of learning.

Context affects teachers' principle-orientation of explanations

Presenting Author: Mona Weinhuber, University of Freiburg, Germany; **Co-Author:** Andreas Lachner, University of Tübingen, Germany; **Co-Author:** Timo Leuders, University of Education Freiburg, Germany; **Co-Author:** Matthias Nückles,

University of Freiburg, Germany

Principle-based explanations have shown to be an effective scaffold to support students' understanding. However, prior research suggests that mathematics teachers often neglect principles and rather describe the algorithmic rules without explaining, why these mathematical steps are performed. One reason for this finding may be that classroom context activated a rather procedure-oriented mindset of the nature of mathematics (i.e., math as a "toolbox"), which triggered the teachers to generate more procedure-oriented explanations. We examined how different contexts affected teachers' provision of principle-oriented or rather procedure-oriented explanations. Using mindset priming, we had mathematics teachers either read a comic portraying mathematics as argumentation (students vividly discussed a mathematical problem), or a comic portraying mathematics as a toolbox (students rehearsing algorithms). Afterwards, the teachers wrote an explanation about an extremum problem for novice students. Results revealed that teachers primed with an argumentative context generated more principle-oriented explanations than teachers primed with a toolbox context. The findings suggest that the comics in fact activated different mindsets which led the teachers to either include more principle-oriented or more procedural information in their explanations. These results could stimulate math teachers to critically reflect on the mathematical culture in schools, given that principle-oriented explanations are more effective than procedure-oriented explanations in helping students gain transferable knowledge.

Symposium

Motivational, Social and Affective Processes

Implementing SDT in practice: Improving need-supportive teaching through school-based interventions

Keywords: Assessment methods and tools, At-risk students, Experimental studies, Motivation, Quasi-experimental research, Teacher Professional Development, Teaching approaches

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Lisette Hornstra, Utrecht University, Netherlands

Discussant: Idit Katz, Ben-Gurion University of the Negev, Israel

Many students are not optimally motivated for their academic courses or for physical activities. Teachers can play a crucial role in enhancing their students' motivation in these different areas. Self-determination theory states that fulfillment of students' basic psychological needs for autonomy, competence, and relatedness promotes students' motivation (Deci & Ryan, 2000; Stroet et al., 2013). However, in practice many teachers find it difficult to support students' basic needs and to optimally engage their students in learning or physical activity (Reeve, 2009). During the last decades, a wide variety of interventions for teachers have been developed and these are found to promote teachers' need-supportive interactions with students and consequently enhance students' motivation and academic or health-related behavioural outcomes. The four contributions of this symposium describe four different SDT-based interventions in primary and secondary school that vary in the teaching behaviours they focus on, the domains and type of student outcomes they target, and in their training methods. Previous research suggests that SDT-interventions can indeed be effective in enhancing need-supportive teaching and promoting student motivation (e.g., Su & Reeve, 2011). Yet, not much is known about the conditions under which or for whom these interventions are most effective, how these interventions can best be implemented in diverse settings, and which strategies are most effective for promoting desired teacher and students outcomes. The presentations in this symposium will address these key questions, which are relevant for successfully implementing theory into practice and for continuing research on SDT-based interventions.

Motivating primary school students with diverse backgrounds: Effects of a teacher training

Presenting Author: Desirée Weijers, Kohnstamm Institute, University of Amsterdam, Netherlands; **Co-Author:** Lisette Hornstra, Utrecht University, Netherlands; **Co-Author:** Ineke van der Veen, Kohnstamm Institute, University of Amsterdam, Netherlands; **Co-Author:** Thea Peetsma, University of Amsterdam, Netherlands

With growing diversity in classrooms, teachers face an increasingly complex task of meeting the different motivational needs of every student in the classroom. Autonomy-support, instead of control, is found to be an effective teaching strategy to foster students' motivation. However, teachers tend to be more controlling toward students from disadvantaged backgrounds, because they perceive these students to have a greater need for structure. However, structure can also be offered in autonomy-supportive ways. Therefore, this study investigated whether a teacher training focused on providing autonomy-support in combination with the provision of structure (need-supportive teaching) enhanced need-supportive teaching by teachers and resulted in higher autonomous motivation, self-efficacy, and effort of students. Differentiated effects for ethnicity and SES were examined. 484 primary school students participated. Teachers participated in either the intervention (n = 8) or control group (n = 13). Teachers and students filled out questionnaires at three moments throughout the academic year and observations of teachers' provision of autonomy and structure were carried out. Results of multilevel regression analyses showed that teachers in the intervention group reported more need-supportive teaching compared to the control group. However, students in the intervention group did not experience higher levels of need-supportive teaching or motivation compared to the control group. Also, results were similar for students with different socio-economic and ethnic

backgrounds. This suggest that a more intensive training is needed in order to help teachers become more autonomy-supportive in order to enhance the motivation of students.

How to train teachers to deliver a multi-level SDT-based intervention to promote youth activity

Presenting Author:Katariina Köykkä, University of Helsinki, Finland; **Co-Author:**Elisa Kaaja, University of Helsinki, Finland; **Co-Author:**Katariina Koykka, University of Helsinki, Finland; **Co-Author:**Martin Hagger, Curtin University, Australia; **Co-Author:**Taru Lintunen, University of Jyväskylä, Finland; **Co-Author:**Nelli Hankonen, University of Tampere, Finland

Background. No school-based interventions among older adolescents have shown with long-term effectiveness (Hynynen et al. 2016). The “Let’s Move It” (LMI) project is a school-based program to promote PA and decrease excessive SB among vocational school students and is based on behavioural science, e.g. self-determination theory. A central element is autonomy supportive interaction designed to foster high-quality motivation in students and teachers. **Aims:** To investigate process evaluation data from the original LMI trial to co-develop a teacher training for the LMI. We examine, what are 1) teachers’ views on the “Let’s Move It” program, 2) needs for training optimization, and 3) the final optimized intervention? **Methods:** We draw from the process evaluation quantitative survey of the LMI trial (n=120, teachers, n=1100 students), qualitative research materials (n=18 teachers, n=34 students), and field observations. **Findings:** 1.87 % of teachers would recommend LMI program to their colleagues, and majority (76-82%) agreed on statements regarding beneficiality and effectiveness. 2. Teachers valued the expertise but missed more strategies to motivate students. 3. The optimized training includes pre-course material, 2x2.5 hour contact course, self-support materials and maintenance sessions, and a web-platform. Motivational interaction principles (i.e. reflective listening, non-coercive language) are emphasized. Teachers are prompted to plan and self-monitor the use of these principles. **Theoretical and educational significance of the research:** Next, we will examine training’s acceptability, and its impact on teacher behaviours. This is one of the first studies to transparently report the phased development of co-creating teacher training to intervene on adolescent PA and SB.

Training teachers to assess in a more motivating way – the effects on teacher and student outcomes

Presenting Author:Christa Krijgsman, Ghent University, Belgium; **Co-Author:**Jolien Maes, Ghent University, Belgium; **Co-Author:**Nathalie Aelterman, Ghent University, Belgium; **Co-Author:**An de Meester, Ghent University, Belgium; **Co-Author:**Isabel Tallir, Ghent University, Belgium; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands; **Co-Author:**Greet Cardon, Ghent University, Belgium; **Co-Author:**Maarten Vansteenkiste, Ghent University, Belgium; **Co-Author:**Leen Haerens, Ghent University, Belgium

Previous research argues that grading is negatively related to students’ motivational experiences whilst Assessment for Learning (AfL; to build progress and detect personal progress) is positively related to students’ motivational experiences. However, it is under investigated whether teachers could learn to implement AfL-teaching strategies more and if such strategies could positively influence students’ motivational experiences. To investigate this, we developed a one-day professional development (PD) programme for teachers on how to assess in a more motivating way. In a quasi-experimental design, a sample of 14 physical education (PE) secondary school teachers (N=6 intervention group, N=8 control group) and 222 students participated in this study. Questionnaires measuring the extent of applied AfL-strategies (completed by teachers and students) and students’ motivational experiences (completed by students) were completed pre and post intervention. MANOVA’s were conducted on teacher data and multilevel regression analyses were deployed on student data. Favourable intervention effects were found in the student reports. The intervention prevented students from a decrease in motivational experiences. However, these effects were not evident in the teacher reports. Results suggest that a first step in the right direction has been made. It is recommended to replicate the present study with a larger sample size and to extend the duration of the PD programme so that more collaborative and reflective practices can take place. Only then, teachers will be provided with an opportunity to internalize and implement the AfL-teaching strategies in a more efficient way and larger effects might be obtained in students’ motivational experiences.

Supporting students’ need for autonomy and structure: An intervention study in secondary school

Presenting Author:Lisette Hornstra, Utrecht University, Netherlands; **Co-Author:**Desirée Weijers, Kohnstamm Institute, University of Amsterdam, Netherlands; **Co-Author:**Ineke van der veen, Kohnstamm Institute, University of Amsterdam, Netherlands; **Co-Author:**Thea Peetsma, University of Amsterdam, Netherlands

Self-determination theory states that fulfilment of students’ basic psychological needs for autonomy, competence, and relatedness can promote students’ motivation for school. However, in practice many teachers find it difficult to support students’ need for autonomy and to provide structure in autonomy-supportive ways, especially when it concerns lower achieving students or students from low-SES or ethnic minority backgrounds. In this study, we developed a training for teachers in the lowest track of secondary school on combining autonomy and structure. We examined whether the training increased need-supportive teaching and positively affected developments in students’ domain-specific motivation. Fourteen teachers with 21 classes and 280 students in year one of secondary school filled out questionnaires on need-support and motivation during a pre-test, post-test, and follow-up. Questionnaire data were analysed with multilevel-regression analyses comparing the intervention and control group (N=9 and N=12 classes, respectively). Also lessons of teachers in the intervention group were observed. The results showed declines in experienced autonomy-support, relatedness, autonomous motivation, and effort for students in the control group, whereas these aspects did not decline for students of teachers who participated in the training. The observations indicated a small increase in autonomy-support (especially

choice). Overall, the effects were mostly similar for students with varying background characteristics. Even though this was a small-scaled study, the results show that a teacher training on autonomy-support and structure has the potential to prevent student motivation from declining and can benefit students from varying backgrounds.

Session H 7

31 August 2017 10:15 - 11:45

Symposium

Assessment and Evaluation, Learning and Social Interaction

Bridging Discourse in Educational Research Through Examining the Notions of Stability and Change

Keywords: Assessment methods and tools, Communities of practice, Comparative studies, Conversation / Discourse analysis, Culture, Educational attainment, Interdisciplinary, Philosophy, Psychometrics, Qualitative methods, Quantitative methods, Social aspects of learning and teaching, Social interaction, Student learning, Video analysis

Interest group: SIG 01 - Assessment and Evaluation, SIG 10 - Social Interaction in Learning and Instruction, SIG 25 - Educational Theory

Chairperson: Man Ching Esther Chan, The University of Melbourne, Australia

Organiser: Man Ching Esther Chan, The University of Melbourne, Australia

Discussant: Richard Lehrer, Vanderbilt University, United States

The goal of this symposium is to facilitate conversations between researchers from different research areas in education to further our understanding of each other's work and to promote reflectivity on our own theory and practice. The session will focus on examining the notions of stability and change from various theoretical perspectives, analytical approaches, and research areas. Stability and change are purposefully chosen to provide a neutral entry point for interpretation and reflection of different research perspectives.

The session will open with a presentation reporting a study which used the concepts of stability and change to elicit responses from high status educational researchers from a variety of fields regarding their research practices (e.g., classroom research, educational assessment, and developmental psychology). Following the presentation, three researchers from different research areas will each provide their own interpretation of stability and change in the context of their work. Paper 2 illustrates how trends and changes are conceptualised and measured in large-scale assessment of ICT Literacy. Paper 3 examines the cohesion and change in classroom learning trajectories through the use of Conversation Analysis. Paper 4 explores the tension between stability and variation in the identification of patterns in classroom practices in education systems that are culturally and geographically disjoint. In combination, the four papers offer important insights into the connection and distinction between different educational research perspectives. The symposium will provide the opportunity for the education research community to inquire into our own theory and practice and increase our sensitivity to each other's perspectives.

Examining Different Research Perspectives through Interviews with Researchers: A Dialectic Approach

Presenting Author: Man Ching Esther Chan, The University of Melbourne, Australia

This study aimed to connect the diverse perspectives and research traditions in education through interviews with ten senior researchers in multiple countries. It applied the dialectic approach (Overton, 2003; Stace, 1955) in philosophical investigation using the relational concepts of stability and change to stimulate and understand different views of learning and teaching and to explore the potential application of these different understandings of stability and change in classroom practices. Each interview was around 30 to 60 minutes and semi-structured, generally beginning with some background questions about the interviewee, how learning is defined and studied in their work, and how the interviewee might interpret the issue of stability and change in his or her work. The study found that all of the researchers interviewed could relate their work to stability and change in some ways. The interpretations offered by the researchers can be viewed in terms of two levels: the application of stability and change, and the relationship between the notions of stability and change. Through examining the researchers' interpretations of stability and change, what the researchers view as central to their work and how that relates to their method of investigation can be compared and contrasted. The findings of the study could help to address the incoherence and fragmentation in education discourse and explore ways in which different educational theories and methodologies can complement each other in classroom practice.

Measuring Change in ICT Literacy Over Time

Presenting Author: John Ainley, Australian Council for Educational Research, Australia; **Co-Author:** Julian M. S. Fraillon, ACER, Australia; **Co-Author:** Wolfram Harald Schulz Teuteberg, Australian Council for Educational Research, Australia; **Co-Author:** Eveline Gebhardt, Australian Council for Educational Research, Australia

This paper illustrates the notions of stability and change in terms of the challenges associated with the measurement of Information and Communication Technology (ICT) literacy using a performance assessment. Large-scale assessment studies are used to examine changes over time. Measuring change over time presumes an underlying construct that may be manifest in performance on particular tasks that may be different at different times. This paper focuses on challenges involved in studying change in achievement in ICT literacy where the contexts have changed over time. The Australian National Assessment in ICT literacy was a performance assessment in late primary (Year 6) and mid secondary (Year 10).

This paper discusses the assessment design that was applied in assessment cycles from 2005, through 2008 and 2011 to 2014. It also reports on the trends in ICT Literacy for Year 6 and Year 10, and the relationships of ICT Literacy with other variables, that were observed over this period of time. The notions of stability and change will be explained from the latent trait perspective in terms of how trends and changes are conceptualised and measured in the large-scale assessment study.

Epistemic Topicalizations as Resources for Cohesion and Change in Classroom Learning Trajectories

Presenting Author:Fritjof Sahlström, Åbo Akademi University, Finland; **Co-Author:**Marie Tanner, Karlstad University, Sweden

Despite a seemingly fragmented interactional context, teachers and students in classrooms routinely manage to co-construct coherent, inter-related and individually adapted learning trajectories distributed over days and weeks. The aim of this paper is to explore with what interactional resources progressivity is accomplished in learning trajectories, by focusing on how participants establish relations of cohesion and change between current and previous occasions. Analysis of empirical data shows how participants frequently topicalize aspects of epistemic stance towards a co-constructed learning content. This practice is conceptualized as epistemic topicalizations, shown to play an important role for maintaining cohesion in a learning trajectory, while making it possible for the teacher and the student to progressively change and differentiate their epistemic stance. Epistemic topicalizations are suggested as a useful analytic concept, grounded in Conversation Analysis (CA), to describe how cohesion and change are emically managed in interaction to accomplish progressivity in learning trajectories. The analysis shows how epistemic topicalization is a primary resource in establishing a shared understanding of the evolving epistemic status of the students, and consequently, as a primary resource for adapting and changing teaching and instruction. Epistemic topicalizations seem to be resources both for the contingent organization of learning as social action within and beyond situated interactions, and for the situated construction of differentiation and mutual adaptation of teaching and learning in relation to displayed needs and requests of various students.

Only the Ephemeral is of Lasting Value – Interrogating the Tension between Stability and Variation

Presenting Author:David Clarke, The University of Melbourne, Australia

This presentation illustrates the tension between stability and variation in international classroom research studies in the identification of patterns in classroom practices in culturally and geographically disjoint education systems. In our pursuit of structure in the social interactions we find in the classroom, we are trying to construct enduring portraits of phenomena that are fundamentally transient. When the classrooms that we are studying are culturally and geographically disjoint, identifying stability becomes both a challenge and a source of major insight. The interrogation of stability and variation in this presentation is organised around particular constructs, deliberately chosen because they all relate to classroom practice but are all of different levels of granularity. In this paper, consideration of all such constructs draws on a foundation of extensive cross-cultural classroom research. The purpose of this presentation is to illustrate the difference between those things that can be reported as stable concerning classroom practice internationally and those things that vary, either as a consequence of the vagaries of student learning progress or strategically as a result of teacher decision-making. In fact, it is the dynamic between the generalization and the essential accompanying qualifications that creates the conceptual space for educational speculation. The examples employed in this presentation are intended to highlight precisely such tensions between stability and variation and by interrogation of the revealed tensions, identify those elements most critical to our theorizing about the canonical nature of teaching/learning.

Symposium

Students', Peers', and Teachers' Monitoring and Regulation: Effects of Cognition and Motivation

Keywords: Cognitive skills, Comprehension of text and graphics, Computer-assisted learning, Developmental processes, Emotion and affect, Metacognition, Motivation, Motivation and emotion, Self-regulation, Social aspects of learning and teaching, Teacher Effectiveness

Interest group: SIG 16 - Metacognition

Chairperson: Mariette van Loon, University of Bern, Switzerland

Chairperson: Martine Baars, Erasmus University Rotterdam, Netherlands

Discussant: Daniel Dinsmore, University of North Florida, United States

Successful classroom learning depends on effective regulation of study, motivation, and affect. Both students and instructors need to accurately monitor learning processes, in order to foster effective regulation. In this symposium, we give consideration to cognitive and motivational factors, and their interrelations with monitoring, regulation, and performance.

Study 1 investigated how learners and teachers combine information to arrive at a judgment. Students (9th grade) studied texts, completed pre-structured diagrams or drew diagrams, and judged their comprehension. Diagram tasks improved monitoring for students, and inspection of diagrams improved teachers' insights into student learning. In study 2, 4th and

6th-graders scored their own and their peers' performance. Children could more accurately score peers than own performance, and high performers show most accurate monitoring. These two studies show that there was consensus between students and their teachers and peers, however, in some cases, teachers and peers can monitor more accurately than students. The last two studies relate monitoring to motivational and affective factors. In study 3, 8th-graders self-regulated their biology learning. Motivation, affect, and monitoring accuracy were related to learning performance. Study 4 investigated how 8th-graders used advanced learning technologies for 8 days in a row. On the later days, students' use of monitoring and self-regulated learning tools declined; students rarely monitored their understanding and motivation anymore. These four studies can give further insight into the interrelations between cognitive, motivational, social and affective factors, and imply that these should be taken into account when training monitoring and regulation in the classroom context.

The Effect of Cue-Availability on Teachers' and Students' Judgment Accuracy.

Presenting Author: Janneke van de Pol, Utrecht University, Netherlands; **Co-Author:** Anique de Bruin, Maastricht University, Netherlands; **Co-Author:** Mariette van Loon, University of Bern, Switzerland; **Co-Author:** Tamara Van Gog, Utrecht University, Netherlands

For effective regulation of student learning, it is imperative that both teachers' and students' judgments about students' current level of knowledge are accurate. Yet, judgments tend to be relatively inaccurate and existing interventions are not highly effective. This study aimed to investigate whether varying the degree to which teachers and students had access to diagnostic cues about students' understanding of texts (i.e., representations of their students' own knowledge in the form of a diagram) improved teachers' and students' judgment accuracy.

Students (N=229, Age M=14.6) from 17 teachers were randomly assigned to a control condition, a diagram-completion condition, or a diagram-drawing condition. Each teacher judged understanding of 15 of his/her own students based on their name only (control-condition, 5 students), name+completed diagram (completion condition, 5 students) and name+drawn diagram (drawing condition, 5 students).

We found that students' judgment accuracy increased by completing diagrams compared to not completing a diagram (i.e., control-condition) whereas teachers' judgment accuracy increased by viewing students' drawn diagrams, not by viewing students' names only. Teachers' and students' judgment accuracy did not differ significantly and their judgments were most similar in the diagram-completion condition, compared to the control condition. Thus, judgment accuracy can improve by having access to cues about students' knowledge representations, although overall, judgment accuracy was still relatively low, even in the experimental conditions. Nevertheless, we can conclude the key to further improve judgment accuracy – which is pivotal for effective regulation of student learning – may lie in helping teachers and students to focus on diagnostic cues.

Elementary School Children's Self- and Peer Scoring of Test Responses Using Feedback

Presenting Author: Mariette van Loon, University of Bern, Switzerland; **Co-Author:** Claudia Roebers, University of Bern, Switzerland

Children's calibration is often not accurate when making self-score judgments (SSJs) about performance, and as a result, their self-regulation is not effective. Feedback may support young learners to improve calibration of SSJs. Further, monitoring others' seems easier than monitoring oneself, and therefore, calibration may be more accurate when children make peer-score judgments (PSJs) than SSJs. Further, older children may be more accurate when making SSJs and PSJs than younger children. We investigated how well elementary children (4th and 6th graders) can score their own and their peers' test responses with use of feedback standards. Children they difficult concepts, took an open-ended test, then compared their own and a peer's test responses with a feedback standard, and made SSJs and PSJs about accuracy of test responses. Calibration of SSJs was less accurate than calibration of PSJs, and calibration of SSJs and PSJs was more accurate for 6th than for 4th graders. Children who were more overconfident when making SSJs were also more overconfident when making PSJs, indicating that overconfidence was consistent. Moreover, calibration accuracy for self and peers was related to task achievement; calibration of SSJs and PSJs was less accurate and more overconfident for children who had lower performance. Findings show that peer-scoring is more accurate than self-scoring, and imply that interventions to improve calibration should especially focus on children with low task performance.

The Influence of Affect and Motivation on SRL When Learning to Solve Problems in Secondary Education

Presenting Author: Martine Baars, Erasmus University Rotterdam, Netherlands; **Co-Author:** Lisette Wijnia, Erasmus University Rotterdam & University College Roosevelt, Netherlands; **Co-Author:** Fred Paas, Erasmus University Rotterdam/University of Wollongong, Netherlands

Self-regulated learning skills are essential for learning during school years and in working life. Secondary school students often encounter problem solving-tasks when learning about different subjects in their curriculum (e.g., biology or math). Furthermore, opportunities for learner control, such as monitoring and selecting study tasks, are becoming increasingly important to help students prepare for future learning. Next to cognitive resources, learning to solve problems in a self-regulated way demands emotional resources and motivation. Therefore, the current study investigated the relation between affect (i.e., Positive Affect and Negative Affect Scale), motivation (i.e., autonomous and controlled motivation), and self-

assessment accuracy and regulation choices when learning to solve biology problems in an online learning environment. Students first studied video-modeling examples demonstrating how to solve biology problems, self-assess performance, and choose a next task. Then they practiced this self-regulated learning cycle and took a posttest with the same procedure. Results showed that both affect and motivation were predictors of problem-solving performance, in such a way that negative affect had a negative effect on performance, and autonomous motivation was positively related to performance. Furthermore, better self-assessment accuracy was related to higher performance. The results from the current study showed that students' affect and autonomous motivation for learning play a crucial role in self-regulated learning in secondary education. Future research could further disentangle the relation between affect, motivation, monitoring accuracy and regulation choices.

Measuring Middle School Students' Metacognitive Monitoring during Science Learning with SimSelf

Presenting Author:Michelle Taub, North Carolina State University, United States; **Co-Author:**Nicholas Mudrick, North Carolina State University, United States; **Co-Author:**Roger Azevedo, North Carolina State University, United States

Advanced learning technologies (ALTs) can be used to measure and foster middle-school students' metacognitive monitoring and regulation during learning. This study investigated how 63 8th-grade students monitored and regulated their self-regulated learning (SRL) processes during three days (from an 8-day classroom study) during learning with SimSelf, an ALT designed to foster SRL during science learning. Results revealed that on day 2, students spent significantly more time using the Skill Diary than on days 4 and 6. Overall, middle students' students rarely monitor their emerging understanding and other critical SRL processes (e.g., motivation, emotions) and rarely use embedded metacognitive tools (e.g. skill diary) to facilitate monitoring and regulation of key cognitive, affective, and motivational processes during learning. Our results have implications for training the effective use of metacognitive monitoring during learning.

Symposium

Motivational, Social and Affective Processes

The development of achievement motivation during school years

Keywords: Achievement, Attitudes and beliefs, Goal orientation, Literacy, Mathematics, Motivation, Teacher Effectiveness

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Jaana Viljaranta, University of Eastern Finland, Finland

Organiser: Kati Vasalampi, University of Jyväskylä, Finland

Organiser: Jaana Viljaranta, University of Eastern Finland, Finland

Discussant: Anna-Maija Poikkeus, University of Jyväskylä, Finland

This symposium focuses on the development of achievement motivation in different phases of the school career, bringing together quantitative empirical results from Finland, Estonia and Germany. Achievement motivation is considered to be a multifaceted concept including several different aspects, such as valuing of a specific subject and beliefs about one's abilities in a subject. One study uses Finnish samples with a cohort design to examine whether lower secondary school students' motivation overall has changed during the recent years. Three other studies examine the individual variation in motivation and in the development of motivation from kindergarten forward. One of them focuses on years from kindergarten to grade 2 of primary school in Finland, another covers grades 2 to 9 in Estonia, and the third one focuses on grades 9 and 10 in German system. Together these studies show that lower secondary school students' achievement motivation has not dramatically changed during recent year, but decline in achievement motivation is in particular risk at the end of primary school. Furthermore, the membership in maladaptive motivational groups can be identified very early, already in kindergarten or during first primary school years. The results give also important information to educational practices by showing that students' group membership show relatively high stability over school years, indicating that early interventions may be crucial for maladaptive motivational groups. Together these complementary studies provide insights into the changes and stability in students' achievement motivation and to the individual developmental pathways of achievement motivation.

Signs of changes in students' school motivation and well-being?

Presenting Author:Minna Torppa, University of Jyväskylä, Finland; **Co-Author:**Kati Vasalampi, University of Jyväskylä, Finland; **Co-Author:**Kenneth Eklund, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

The present study aimed to examine with a cohort design whether lower secondary school students' school motivation (self-concept in literacy and in math, task values, achievement strategies and educational aspirations) and school well-being (school enjoyment and burnout) have changed from 2007 to 2014 in Finland. The sample was merged from two

follow-up studies. A sample concerning years 2007–2010 ($n = 1702$) is part of the Jyväskylä Longitudinal Study of Dyslexia (JLD) and a sample concerning year 2014 is part of the First Step Study ($n = 1167$). Results showed that students' educational aspirations and particularly girls' math motivation at Grade 7 have risen from 2007 to 2014. At the same time, students' literacy motivation has decreased. In addition, school motivation and school enjoyment differed between girls and boys: girls were more motivated to study literacy than boys, whereas boys valued math more than girls. Interestingly, although girls reported higher school enjoyment than boys, particularly boys' enjoyment had recently increased. School burnout, instead, had not changed across years.

Patterns of Word Reading Skill, Interest, and Self-Concept of Ability

Presenting Author:Jaana Viljaranta, University of Eastern Finland, Finland; **Co-Author:**Noona Kiuru, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Gintautas Silinskas, University of Jyväskylä, Finland; **Co-Author:**Anna-Maija Poikkeus, University of Jyväskylä, Finland; **Co-Author:**Jari-Erik Nurmi, University of Jyväskylä, Finland

Students who are interested in and who have positive self-concept of their ability in specific academic tasks typically perform better in those tasks than students with negative self-perceptions and a low level of interest (e.g., Eccles et al., 1983; Pintrich & Schunk, 2008). Recently it has, however, been suggested that the associations between academic skills, self-concept of ability, and interest are not necessarily similar for all individuals (e.g., Aunola, Leskinen, Onatsu-Arviolommi & Nurmi, 2002; Nurmi & Aunola, 2005). This study aimed to broaden the previous literature, which has mainly deployed variable-oriented approach, by using person-oriented methods to examine the patterns and dynamics of pattern change in Finnish children's ($N = 606$) word reading skill, self-concept of ability, and interest from kindergarten to Grade 2. Six groups of children were identified by using the I-states as objects analysis (ISOA) procedure: (a) low skills, negative self-concept but high interest; (b) high skills but low interest; (c) average; (d) high skills, positive self-concept, and high interest; (e) low skills, negative self-concept, and low interest; and (f) positive self-concept but low interest. The typically occurring transitions between groups were characterized by changes in either reading-related interest or simultaneously in self-concept and skills. Gender, risk for reading difficulties (RD), being an early reader, mother's level of education and home literacy environment predicted group membership in kindergarten, and gender, RD risk, being an early reader, and mother's level of education also predicted transitions between groups.

Motivation and well-being at Grade 9 and underlying development of self-concept and interest in math

Presenting Author:Anna-Liisa Jögi, Tallinn University, Estonia; **Co-Author:**Eve Kikas, Tallinn University, Estonia

Our study aimed to first differentiate graduating middle schoolers based on their math-specific motivation and general learning-related well-being, and next back-track the development of math self-concept and interest of students from different motivational and well-being profiles. We followed 253 students (54.5% of boys) from Grade 2 to Grade 9, measuring their self-reported self-concept and interest in math in Grades 2, 3, 6, and 9, and additionally their performance-avoidance goals, task-avoidant behavior, school burnout and well-being in Grade 9. We used latent profile analysis to determine four groups of students with distinct motivational and well-being patterns. Next we showed that although students' self-concept and interest had been very high in Grade 2, in almost all cases it had declined by Grade 9, most rapidly between Grades 3 and 6. There was a deeper decline for students with more maladaptive motivational pattern in Grade 9. Students with higher motivation and well-being in Grade 9 showed no decrease in their self-concept. Math interest and self-concept of students reporting less motivation and highest burnout, had started declining already during primary school, between Grades 2 and 3. Practical implications of these findings are discussed.

Student-perceived teacher behaviors and motivational profiles in mathematics:

Presenting Author:Charlott Rubach, University of Potsdam, Germany; **Co-Author:**Rebecca Lazarides, University of Potsdam, Germany; **Co-Author:**Julia Dietrich, Friedrich Schiller University of Jena, Germany; **Co-Author:**Päivi H. Taskinen, Friedrich Schiller University Jena, Finland

This longitudinal person-centred study investigated the stability and change of students' motivational profiles in mathematics and their relations to student characteristics (gender, mathematics anxiety and effort) and student-perceived teacher beliefs and behaviors in mathematics classrooms. Survey data stemmed from 6020 ninth Grades who participated in two measurement occasions of the PISA-I Plus Study 2004 (55.2% girls) of 152 schools and 275 classrooms in 108 classes. Latent class analysis revealed four motivational profiles: a moderate motivation profile, a low motivation profile, a high motivation profile, and a high self-concept, low interest profile. Girls were overrepresented in the low motivation profile and underrepresented in the other profiles. Stability of a student's motivational profile from Grade 9 to 10 was typical, but also more students than expected by chance moved from the high motivation profile to the high self-concept, low interest profile. Multinomial logistic regression analyses showed that when students perceived low levels of clearness of instruction at Time 1 they were significantly more likely to be in the high self-concept, low interest profile than in the high motivation profile at Time 2. In turn, students in the low motivation profile at Time 1 were significantly more likely to perceive lower mathematics teacher enthusiasm, clearness of instruction and teaching for meaning at Time 2 compared to students in the high motivation profile. The findings are relevant for research on learning and instruction as

they address the question of the heterogeneity of students in mathematics classrooms.

Symposium

Cognitive Science

The neuroscience of learning: implications for education

Keywords: Cognitive development, Educational Psychology, Game-based learning, Interdisciplinary, Learning analytics, Learning and developmental difficulties, Mathematics, Neuroscience, Reasoning, Student learning

Interest group: SIG 22 - Neuroscience and Education

Chairperson: Jérôme Prado, France

Discussant: Roland H. Grabner, University of Graz, Austria

After two decades of debate about the scientific plausibility and the possibility of legitimate applied contributions to teaching and learning, the field of educational neuroscience currently emerges with sound theoretical foundations, a clear agenda for empirical research, and reaps the benefits from improvements in brain-imaging techniques and methodology. This symposium articulates a collection of examples/directions in how (cognitive and affective) neuroscience can inform education and teaching. The symposium is centered around the idea that a better understanding of learning at the biological level can refine our (cognitive) theories of learning and consequently improves pedagogical interventions. The four presentations articulate cognitive features of a learning task with underlying brain processes. Collectively, the papers illustrate how, when behavioral data is insufficient because relevant information cannot be obtained because operations are not manifested in behavior or are not obtained at the appropriate time scale, brain-imaging data can contribute new insights in modeling cognition, which in turn can inform the design and empirical validation of interventions.

Effort versus trait praise differentially influences negative feedback processing in adolescents

Presenting Author: Nienke van Atteveldt, VU University Amsterdam, Netherlands; **Co-Author:** Nikki Lee, VU University Amsterdam, Netherlands; **Co-Author:** Miriam Hollarek, VU University Amsterdam, Netherlands; **Co-Author:** Lydia Krabbendam, VU University Amsterdam, Netherlands

Adaptively responding to teacher's feedback is important for learning. Previous research has demonstrated that praising intelligence as a fixed trait can lead to less adaptive motivational and learning patterns, compared to praising someone's effort. Here, we investigated adolescent's neural processing of negative feedback during a math task, while manipulating task difficulty and praise context. After a correct response, half of the participants received trait praise ("you are smart!"), the other half effort praise ("again, great effort!"). Negative feedback after an incorrect response was always identical. Preliminary fMRI analyses indicate that activation of the insula and ACC during negative feedback was stronger in the effort-praise context. Ongoing analyses are testing how these differences relate to task-performance (with varying difficulty levels) and to theory of intelligence. Our findings of the impact of what is praised on how negative feedback is processed underlines the importance of how feedback is provided.

A neural dissociation between deductive and probabilistic reasoning in children

Presenting Author: Jérôme Prado, Centre National de la Recherche Scientifique (CNRS), France

Learning to deduce conclusions from prior information is central to the growth of scientific thought in children. Yet, the neural mechanisms underlying the development of deductive reasoning remain poorly understood. Here we investigated whether the brain regions that support deductive reasoning differ from those that underlie everyday probabilistic reasoning in 8- to 13-year-olds. In a functional magnetic resonance imaging (fMRI) scanner, children were presented with conditional premises and were asked to evaluate a conclusion either based on deductive or probabilistic instructions. We found that performance under deductive instructions was associated with activity in the left inferior frontal gyrus and posterior medial prefrontal cortex, whereas performance under probabilistic instructions was associated with activity in the right inferior frontal gyrus, anterior medial prefrontal cortex, and bilateral parietal cortex. Thus, making deductive inferences from conditional premises relies on brain mechanisms that qualitatively differ from those involved in making probabilistic inferences from similar premises in children. Implications for theories of deductive reasoning and education will be discussed.

Strategy over operation: Neural activation in fact retrieval and procedural strategy use in children

Presenting Author: Brecht Polspoel, KU Leuven, Belgium; **Co-Author:** Lien Peters, KU Leuven - University of Leuven, Belgium; **Co-Author:** Bert De Smedt, KU Leuven - University of Leuven, Belgium

Adult fMRI studies have indicated that activation in the arithmetic brain network is modulated by strategy use. However, little is known to which extent the use of different strategies affects the arithmetic network in children. We therefore, by using trial-by-trial verbal strategy reports, investigated the neural underpinnings of different types of strategy use during arithmetic in children. Participants were 23 typically developing 4th graders (9- to 10-year-olds). In a behavioral session, all children were asked to solve 100 subtraction and multiplication items, and to verbally report on a trial-by-trial basis how they had solved them. Next, in the fMRI scanning session, the children were presented with 80 of those items. With an event-

related design, we were able to analyze the brain responses during retrieval or procedural strategy use, based on the children's verbal reports in the behavioral session. During retrieval, we observed increased activity in the bilateral middle temporal gyrus, hippocampus, medial frontal gyrus and inferior parietal lobe. For procedural strategies, activation increases were observed in the bilateral superior parietal lobe, middle and inferior frontal gyri, insula and inferior occipital gyri. No differences were found between multiplication and subtraction, indicating that differences across items were driven by strategy use and not by the operation at hand. These data add to a better understanding of the development of mathematical skills at the biological level, which in turn can refine current psychological theories and improve interventions.

The neuroscience of learning: issues in modeling cognition and learning contexts

Presenting Author:Julien Mercier, University of Quebec (Montreal), Canada; **Co-Author:**Pierre Chalfoun, User Research Lab – Ubisoft Montreal, Canada; **Co-Author:**Kamran Shaikh, University of Quebec in Montreal, Canada; **Co-Author:**Babak Khosravifar, University of Quebec in Montreal, Canada

The optimization of learning contexts requires pertinent information corresponding to the rate of change of characteristics of interest pertaining to the learner and to the learning context. Such characteristics can change from state to state very rapidly. Indeed, cognition is seen as a cascade of top-down and bottom-up processes across behavioral and psychophysiological layers in a cognitive architecture (Anderson, 2002). Moreover, a learning task and accompanying context can be conceived of as a hierarchical decomposition of operations which, cumulatively and sequentially, are necessary to complete the task successfully. Such a multi-layered view of cognition, learning tasks and contexts provides a property that can serve as a cornerstone for the neuroscience of learning: as complexity increases, speed decreases, and as complexity decreases, speed increases. Capturing change at these various timescales and complexity levels requires both psychophysiological and behavioral data recorded concomitantly and presents significant challenges (Mercier, & Charland, 2013a; 2013b). The goal of this presentation is to illustrate an innovative cross-disciplinary methodology to define and track dynamic aspects of cognition and of a learning context as they unfold in time at various timescales during an initial episode of play with a video game, which aims specifically at developing a minimal level of mastery of the game's core mechanics (combat, crafting, economy, etc.). This approach could help bridge the gap between cognitive neuroscience and cognitive psychology in the study of learning and could contribute insights in the design of learning environments.

Session H 11

31 August 2017 10:15 - 11:45

Symposium

Teaching and Teacher Education

The evolution of PCK of history teachers.

Keywords: Competencies, History, In-service teacher education, Inquiry learning, Meta-analysis, Pre-service teacher education, Qualitative methods, Quantitative methods, Teacher Professional Development, Teaching / instruction, Teaching approaches

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Gerhard Stoel, RICDE / University of Amsterdam, Netherlands

Discussant: Jannet van Drie, University of Amsterdam, Netherlands

Traditionally, history education has the attention of politicians valuing goals such as transferring national narratives, citizenship and critical thinking. This interest is also reflected in the growing body of knowledge and research into the field of teaching and learning history, aiming at historical thinking. However, not much research exists about the subject related knowledge and skills history teachers need to fulfil the needs of modern society. This symposium explores the possibilities of the construct of Pedagogical Content Knowledge (PCK) in order to determine (1) what characterizes the PCK of history teachers, and (2) how PCK of history teachers evolves in theory and practice. The PCK of history teachers is captured in different ways; first the concept of PCK is explored in a review study with research on knowledge of history teachers. This provides a theoretical context for three empirical studies; a study that develops an instrument that measures PCK conducted among preservice teachers (N=336) trying to cover declarative and procedural knowledge of PCK in history education. The third study investigates the PCK-development of preservice teachers (N=36) in light of a training program that prepares these teachers for teaching inquiry in their classrooms. Finally the content and context dependency of PCK is explored by comparing the PCK of experienced history teachers (N=16). This symposium describes the evolution of PCK in history and critically reflects on the use of the construct of PCK in order to investigate the development of history teachers.

What makes a history teacher? An empirical review of PCK in History.

Presenting Author:Hanneke Tuithof, Utrecht University, Netherlands; **Co-Author:**Albert Logtenberg, Leiden University, Netherlands

Pedagogical Content Knowledge is teachers' knowledge about the transformation of subject matter knowledge to achieve enhanced student learning. To explore emerging research on history teachers' PCK in secondary education, 34 empirical studies that investigated beginning and experienced history teachers were systematically reviewed. We examined the conceptualization and operationalization of PCK and PCK development in empirical educational research. These mainly

American articles examine PCK on the basis of a small number of teachers and qualitative instruments. Moreover, they also refrain from giving a systematic definition of PCK, which makes it difficult to link the outcomes to other domains. However, we do point to specific avenues for further PCK research.

Test-Development for a standardized instrument to measure PCK of future history teachers

Presenting Author:Nicola Brauch, University of Bochum, Germany; **Co-Author:**Joana Seiffert, Ruhr-University Bochum, Germany; **Co-Author:**Andreas Seifert, University of Paderborn, Germany; **Co-Author:**Martin Rothland, Siegen University, Germany; **Co-Author:**Joergen Wolf, Ruhr-University Bochum, Germany

Before moving in their practical teacher training, German students of history education (Master of Education in history) attend several courses to learn about the theoretical principles and hands-on planning activities to prepare history lessons in school. Although there has scarcely been empirical research about professional competence development in the domain of history education for the German context yet one can identify a conventional set of concepts students learn in university courses. In order to gain a standardized test instrument to measure students' skills in conceptual knowledge and related activities to plan a lesson 165 items have been constructed. A framework covering four dimensions representing PCK's facet of knowledge of instructional strategies and representations has been modelled. In a study (N= 365) these four dimensions could be confirmed as distinct parts of PCK's facet of knowledge of instructional strategies and representations in the sense of planning skills. The four constructs are knowledge about (1) concepts and aims, (2) structuring principles, (3) learning material and (4) tasks.

Developing student history teachers' PCK: an introductory training on inquiry-based learning

Presenting Author:Michiel Voet, Ghent University, Belgium; **Co-Author:**Bram De Wever, Ghent University, Belgium

This study focusses on the development of student history teachers PCK, and, in particular, their implementation of inquiry-based learning (IBL) activities in the classroom. A workshop was developed to impart student teachers (n=36) with the knowledge necessary to organize IBL. After attending this workshop, student teachers were required to teach an IBL-activity during their teaching internship. Their work in practice was examined through: a questionnaire administered at three different times, the lesson plan of the IBL-activity, two reflection papers, and an interview. Three lesson templates emerged from student teachers' work: a fill in the blanks, synthesis and inquiry lesson. These templates differed with regard to (1) the structuring they provided, and (2) the required student mental activity. Next to providing concrete illustrations of these three lesson templates, the presentation will also explore the relation between student teachers' choice for a particular template and (1) their beliefs related to IBL, as well as (2) influences of the internship context.

The homogeneity of Dutch experienced history teachers' PCK in a curriculum innovation

Presenting Author:Hanneke Tuithof, Utrecht University, Netherlands; **Co-Author:**Larika Bronkhorst, Utrecht University, Netherlands; **Co-Author:**Jan van Tartwijk, Utrecht University, Netherlands; **Co-Author:**Leen Dorsman, Utrecht University, Netherlands

In this study we examine the content and context dependency of PCK of experienced history teachers in the specific Dutch context of in a radical curriculum innovation. Until now researchers have rarely described or compared the concrete PCK of two or more concepts. We capture the PCK of sixteen Dutch experienced history teachers on two substantive concepts that are part of a new history curriculum, namely (1) the clash between Greco-Roman culture and the Germanic cultures of North-West-Europe and (2) waging World Wars I and II. Our research question is a dual one: firstly, to what extent is history teachers' PCK homogenous on two different concepts in this history curriculum? And, secondly, how can we explain the degree of the homogeneity in history teachers' PCK? On balance, there seems to be a continuum in the homogeneity history teachers' PCK: at one end of this continuum the PCK seems less homogeneous and more related to one of the substantive concepts mentioned above. At the other end of the continuum, history teachers' PCK seems more homogeneous, what we relate to the fact that these teachers have the same subject-related goals for both substantive concepts. The continuum as a whole reaffirms the content and context dependency of PCK. We also discuss the significance of our outcomes for the debate regarding the role of the PCK element teaching orientation.

Symposium

Instructional Design

How am I doing? Improving students' self-assessments

Keywords: Achievement, Educational Psychology, Experimental studies, Instructional design, Metacognition, Motivation, Qualitative methods, Self-regulation

Interest group: SIG 16 - Metacognition

Chairperson: Marloes Nederhand, Erasmus University Rotterdam, Netherlands

Discussant: Anique de Bruin, Maastricht University, Netherlands

Accurate calibration (accurately assessing your performance or your knowledge) is crucially important for the regulation of

study. However, assessing our own performance or knowledge is a challenging task, and students often overestimate their competence. Consequently, researchers in education are investigating various methods for improving calibration. The sine qua non of improving calibration is being aware of (the possibility of) miscalibration. In this symposium, we therefore discuss how learners can become more aware of their miscalibration. Raaijmakers et al. and Nederhand et al. focus on the effect of feedback. Raaijmakers et al. provided students with feedback on the accuracy of their self-assessment and investigated if subsequent self-assessments would become more accurate. Nederhand et al. showed in a previous study that high and low performers may differ in how they use feedback. In this symposium, Nederhand et al. will present a follow-up study in which they investigated whether providing students with extra guidance how to use standards can further remedy low performers' miscalibration. However, feedback alone is sometimes not enough to improve calibration accuracy. Roelle et al. focussed on motivational aspects of being accurately calibrated and investigated if calibration could be increased by informing students of the dangers of overconfidence. Finally, Gutierrez et al. provides an in-depth investigation into the differences in awareness of (mis-)calibration between poor and proficient calibrators. They provide guidelines for the designs of future interventional studies aimed at improving calibration accuracy. Anique de Bruin, expert in metacognition research, will discuss the different contributions to the symposium.

Providing Feedback on Self-Assessments: Effects on Subsequent Self-Assessment and Task Selection

Presenting Author:Steven Raaijmakers, Utrecht University, Netherlands; **Co-Author:**Martine Baars, Erasmus University Rotterdam, Netherlands; **Co-Author:**Fred Paas, Erasmus University Rotterdam/University of Wollongong, Netherlands; **Co-Author:**Jeroen Van Merriënboer, Maastricht University, Netherlands; **Co-Author:**Tamara Van Gog, Utrecht University, Netherlands

Monitoring and control are key components of self-regulated learning (SRL). Students' monitoring accuracy is often low, which negatively affects subsequent regulation (control) of study behaviour (e.g., prematurely terminating study, or studying unnecessarily long; selecting a too easy or too difficult subsequent task). Consequently, SRL often leads to suboptimal learning outcomes. It is thus imperative for educational researchers to investigate ways to improve students' monitoring accuracy. One effective instructional intervention consists of training students' self-assessment (monitoring) and task-selection (control) skills with video modeling examples, in which students observe another person (the model) engaging in self-assessment and task-selection. However, even after this training, there remains room for improvement in students' self-assessments. Therefore, we investigated whether scaffolding self-assessments with accuracy feedback after the training, would improve the accuracy of concurrent task-selection, as well as their future self-assessment and task-selection decisions in the absence of the feedback. Students either received no feedback, general feedback (i.e., information regarding the accuracy/inaccuracy of their self-assessment and information regarding the number of correct steps) or specific feedback (i.e., information regarding the accuracy/inaccuracy of their self-assessment and information regarding *which* steps were correct/incorrect). Contrary to our hypothesis, however, self-assessment accuracy feedback did not affect concurrent task-selection accuracy and even led to less accurate future self-assessments and task selection. Possible explanations are discussed.

Providing Standards both with and without Idea-Units to improve Calibration Accuracy

Presenting Author:Marloes Nederhand, Erasmus University Rotterdam, Netherlands; **Co-Author:**Huib Tabbers, Erasmus University Rotterdam, Netherlands; **Co-Author:**Remigius (Remy) Rikers, UCR / Utrecht University, Netherlands

Previous research showed that providing performance standards can improve calibration accuracy of students. However, low performers are less accurately calibrated than high performers, even when both groups receive standards. This experimental study investigated whether providing students with extra guidance how to use standards would remedy the significant difference in calibration accuracy between high and low performers. We hypothesized that by providing extra guidance, all students become equally able to compare their own answer to standards (i.e., significant differences in calibration accuracy will disappear). We provided 120 participants with texts that contained key terms. Students had to recall the correct definition of each key term and had to estimate the quality of their recall. One half of the participants received full definition standards while estimating performance, and the other half of the participants received idea-unit standards while estimating their performance. Data is being gathered at the moment and results will be discussed during the symposium.

Effects of Informing Fifth Graders About the Dangers of Making Overconfident Judgments of Learning

Presenting Author:Julian Roelle, Bielefeld University, Germany; **Co-Author:**Kirsten Berthold, University of Bielefeld, Germany

Learners often insufficiently monitor their level of comprehension, which results in overconfident judgments of learning and underachievement. One reason for insufficient monitoring is that learners do not know why they should invest significant effort in this process. In light of this reason, informing learners about the high frequency of and the detrimental consequences that result from overconfident judgments of learning (i.e., providing information about *the dangers of making overconfident judgments of learning*) has recently been introduced as an approach to foster comprehension monitoring. However, although this approach has shown promising effects, it is reasonable to assume that its benefits depend on learners' monitoring skills; if learners' lack monitoring skills, informing them as to why investing effort in monitoring is important could be of little use. To address this potential moderator, we tested the effects of the approach of informing learners about the dangers of making overconfident judgments of learning in a sample of fifth grade high school students

($N = 47$). Based on previous research, it is reasonable to assume that these learners lack monitoring skills to a large extent. As main results, we found that informing the learners about the dangers of making overconfident judgments of learning neither fostered monitoring nor reduced overconfidence in a subsequent learning phase. We conclude that, at least if it is not combined with components that focus on fostering monitoring *skills*, informing learners about the dangers of making overconfident judgments of learning is not necessarily a promising approach to foster monitoring in all situations.

The Calibration Process Among Proficient and Low Calibrators: A Qualitative Approach

Presenting Author: Antonio Gutierrez de Blume, Georgia Southern University, United States; **Co-Author:** Pamela Wells, Georgia Southern University, United States; **Co-Author:** Jason Parker, Georgia Southern University, United States

Traditional research on the metacognitive practice of calibration has been primarily investigated within the realm of quantitative experimental methodologies. This article expands the research scope of metacognitive calibration by offering a qualitative approach to the growing body of literature. More specifically, the current study investigates the learners' perspective on the calibration process. Ten undergraduate students were selected to participate in a structured interview on their previous calibration performances (five students low in calibration processing and five proficient in calibration processing). Ultimately nine students ($N=9$) participated in individual interviews. Participant interviews are qualitatively assessed through the mediums of (1) Serra and Matcalfe's original work on the "feelings of knowing" and (2) self-regulated learning theory (SRL). Results indicate a difference in feelings of knowing between low and proficient calibrators across a battery of themes: effort, strategies, planning, and evaluation. Implications of the results and direction for future research are explored.

Session H 13

31 August 2017 10:15 - 11:45

Main Building C - C7

Symposium

Developmental Aspects of Instruction, Educational Policy and Systems

Curriculum, pedagogy, and classroom quality: Promoting effectiveness of early childhood education

Keywords: Assessment methods and tools, Case studies, Comparative studies, Early childhood education, Educational policy, Educational Psychology, Qualitative methods, Social interaction, Teaching / instruction, Teaching approaches

Interest group: SIG 05 - Learning and Development in Early Childhood

Chairperson: Kathy Sylva, University of Oxford, United Kingdom

Discussant: Antje von Suchodoletz, New York University Abu Dhabi, United Arab Emirates

Evidence clearly indicates that high quality of early childhood education and care (ECEC) provisions shapes children's later learning and development. The term quality is a multidimensional construct referring to the extent to what is on offer to children in an environment that enhances child's development and wellbeing. Process quality refers to adult-child interaction, a positive climate, and how educators scaffold child's learning while structural quality refers to characteristics of the setting that provide the contextual framework within which process quality operates. The present symposium will show the evidence on the cultural sensitivity of the curriculum implementations as well as structural and process quality in ECEC settings using mixed-method approach. Drawing on research conducted in the EU funded CARE project (*Curriculum and quality analysis and Impact Review of ECEC*) papers in this symposium will present (1) approaches to curriculum and pedagogy based on surveys in eleven European countries, (2) the evidence of combined and interaction effects between structural and process quality in different contexts, (3) the quality of different activities in video observation study of good practice in ECEC settings, and (4) patterns of educational dialogues in toddler classrooms. Overall, the four papers of the symposiums suggest that the process quality should be a priority in ECEC. The discussion will highlight the cultural sensitivity of ECEC quality and curriculum implementations across Europe and discuss on key features of high quality practices in ECEC along with the institutional supports that underpin it.

Towards a new ECE curriculum for Europe: findings from the CARE research project

Presenting Author: Kathy Sylva, University of Oxford, United Kingdom; **Co-Author:** Katharina Ereky-Stevens, University of Oxford, United Kingdom; **Co-Author:** Martine Broekhuizen, Utrecht University, Netherlands

This paper summarises findings on the broad curricular goals of ECEC with regards to children's development, learning and wellbeing. It is based on two studies carried out in a broadly representative sample of European countries: a survey on curriculum completed by 'research experts' in 11 countries, and a face-to-face interview or on-line survey of parents' ($N = 2500$ parents) goals regarding ECE carried out in nine countries. This paper on curriculum uses the expert and the parent surveys to chart the conceptual and empirical landscape in which the symposium's papers are located. It shows that despite an emerging consensus on the advantage of combining aims for social-emotional development with cognitive ones, there is a lack of clarity on the way that learning – in particular learning related to intellectual goals – is conceptualized. Although experts and parents agree that the curriculum for children at age 3-6 should be more 'cognitive', there is no consensus on the pedagogy that will best support the development of content knowledge or of 'executive skills' such as problem-solving or teamwork.

Complex relations between structural characteristics and process quality in ECEC across Europe

Presenting Author:Pauline Slot, Utrecht University, Netherlands; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland; **Co-Author:**Paul Leseman, Utrecht University, Netherlands

Relations between structural and process quality in early childhood education and care (ECEC) provisions have been extensively studied with mixed and inconsistent findings. Although these inconsistent findings might in part be due to strong and country-specific regulation, which results in restricted variance, it may also point to more complex relations of different structural aspects interacting with each other and jointly affecting process quality. The aim of the current paper is to unravel these associations by looking at possible combined and interaction effects of structural features at the teacher, classroom and centre level on observed process quality in several European countries. The results can inform policy and practice in view of enhancing process quality in ECEC settings.

How does process quality vary according to the classroom activities? A multiple case study

Presenting Author:Joana Cadima, University of Porto, Portugal; **Co-Author:**Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Pauline Slot, Utrecht University, Netherlands; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

The current study investigates the extent to which the quality of interactive processes varies across different types of activities in ECEC centers from seven European countries. Using a common methodological framework, 4 ECEC centers per country, in a total of 28, were selected. Videos were made out of four common types of activities in ECEC centers (play, care routines, educational, creative), resulting in a total of 124 videos. Videos were scored by certified researchers from three countries using a standard observational tool (CLASS–Toddler and CLASS Pre-K). The results showed that observed classrooms scored high in emotional support and behavior support/classroom organization. However, there was considerable variation across types of activities and age of the children in the level of instructional support and consideration for child perspectives. In 3-6-year-old classrooms, educational activities seemed to represent moments in which educators facilitated children's broader conceptual understanding of concepts and ideas. Opportunities for learning varied less between types of activities in 0-3 classrooms. Across 0-3 and 3-6 classrooms, play activities provided the best opportunities to follow child lead, consider children's opinions and follow their initiations. Results will be discussed in view of how different types of activities can be intentionally used by educators to potentiate different types of interactions.

Educational dialogues in toddler classrooms

Presenting Author:Helena Rasku-Puttonen, University of Jyväskylä, Finland; **Co-Author:**Jenni Salminen, University of Jyväskylä, Finland; **Co-Author:**Heli Muhonen, University of Jyväskylä, Finland; **Co-Author:**Marja-Kristiina Lerkkanen, University of Jyväskylä, Finland

Educational dialogue (ED) refers to extended verbal exchange between teacher and children, striving to joint understanding. Daily situations in toddler classrooms enable discussions, but variation in the quality of teacher-child interactions and teacher's pedagogical support creates differing opportunities for EDs to emerge from classroom to classroom. Within this study we ask: What kind of patterns of ED can be identified from toddler classrooms; How do teachers' pedagogical practices support and enhance ED; and How does observed process quality reflect the similar characteristics with ED? Data were gathered in seven European countries as part of the CARE project. Within this study, video recordings from emerging academic activities and free play situations in 2–3-year-olds classrooms (n = 28 videos; 20 min each) were analyzed. The episodes of EDs were identified along the set of criteria (Alexander, 2006; Muhonen et al., 2016) and analyzed with respect to teacher's pedagogical practices, functions of talk and the quality of teacher-child interaction (CLASS-Toddler: La Paro et al., 2012). Modest amount of EDs were identified within toddler classrooms along with emerging EDs. Maintaining ED required the teacher to sensitively listen to children's developing verbal expressions and posing straightforward and simple questions (relating to concrete hands on materials or to children's daily experiences). The results indicated a relation between the CLASS dimensions and the depth of EDs. The results will benefit teacher training by increasing teacher awareness of the potential of shared talk in the toddler classrooms.

Symposium

Motivational, Social and Affective Processes

New research perspectives on interest development in science education

Keywords: Biology, Case studies, Emotion and affect, Mixed-method research, Motivation, Motivation and emotion, Primary education, Science education, Secondary education

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Kimberley Pressick-Kilborn, University of Technology Sydney, Australia

Discussant: K. Ann Renninger, Swarthmore College, United States

Globally, the importance of high levels of continued participation by students in science education is being recognised in policy, research and practice, as vital to strong economic futures. The aim of this symposium is to explore how new perspectives on the complexities of interest development can promote effective, engaging teaching and learning in school

science. The papers span science learning from the early years of primary (elementary) school to upper secondary school, with consideration of interest and other motivational variables such as self-efficacy and self-concept, as well as constructs such as time. Each paper either poses a research question that provides a different perspective on interest development, or employs research methods or theoretical frameworks that are relatively new in the study of interest. The cognitive and/or affective dimensions of interest are investigated in each of the papers, with each study situated in real-life, classroom-based learning and teaching contexts. The symposium thus brings together research that focuses on important but currently under-researched issues in relation to interest development, with the shared goal of improving participation and pedagogy in school science education.

A teacher's growing interest in science: Developing alongside Kindergarten students

Presenting Author: Kimberley Pressick-Kilborn, University of Technology Sydney, Australia

A number of researchers recently have investigated the facilitative role that teachers can have in supporting their students' interest development. Conversely, however, there is little research that has examined the process of the growth in teachers' interest that is promoted through working with interested students. This paper reports on a case study of a Kindergarten teacher whose own interest both in teaching science, and in the discipline of science, has been triggered and maintained over time in the context of her classroom teaching experiences. Valsiner's theoretical notions of *canalisation* and *self-canalisation* are drawn on, to analyse and interpret qualitative data gathered over three years through a series of in-depth interviews with the teacher, classroom observations and annotated class programs. The findings focus on an analysis of (1) the nature of the teacher's interest, and (2) her interactions with students and characteristics of the classroom teaching and learning context that constrained and promoted her own pedagogical and discipline-based interest. This case study highlights the bi-directional relationship between students' interests and the teacher's interest, as the teacher moves towards developing a professional identity more strongly inclusive of that of 'science teacher'. Furthermore, evidence is provided for the importance of responsive, playful, inquiry-based approaches in the early years of schooling in promoting *the teacher's* interest and sense of wonder, not only the students'.

Development of Secondary school students' interest and academic emotions over science lessons

Presenting Author: Kalle Juuti, University of Helsinki, Finland; **Co-Author:** Jukka Marjanen, University of Helsinki, Finland;

Co-Author: Jari Lavonen, University of Helsinki, Finland; **Co-Author:** Katariina Salmela-Aro, Helsinki Collegium for Advanced Studies, Finland; **Co-Author:** Barbara Schneider, Michigan State University, United States; **Co-Author:** Joseph Krajcik, Michigan State University, United States; **Co-Author:** Christopher Klager, Michigan State University, United States

In developed countries, there is lack of students' engagement in school science learning. Too few students select a science track in secondary school and then gravitate in a science-related field. It is known that in a classroom, it is possible to influence students' academic emotions through the interaction style and teaching and learning methods selected. In order to help teachers to tackle this problem of the lack of engagement in science learning, it is important to understand the development of the students' academic emotions in classroom situations. This paper presents the development of students' interest and academic emotions over 12 science (chemistry or physics) lessons in nine classrooms. We applied the experience sampling method (ESM) in order to investigate students' interest and academic emotions, namely feelings of success, confidence, activeness, happiness and enjoyment, anxiety, stress, confusion, and boredom in specific science learning situations. During a science lesson, students were asked to respond three times in the mobile phone delivered questionnaire that measured their interest and academic emotions in the specific situations. The ESM questionnaires were synchronized, thus the students in one class responded at the same time. The time-Academic emotion-graphs show that (1) academic emotions fluctuate over the lessons, (2) there are evident gender differences, and (3) academic emotion mean values of all classes appear to be rather stable over time. The Time-Academic emotion –graphs emphasize that situational interest and emotions may be rather easy to trigger, but difficult to maintain.

Students' perceptions of time in learning tasks supporting or lacking interest development

Presenting Author: Morten Rask Petersen, University of Southern Denmark, Denmark

Interest and learning are interdependent. In this study, the process of learning is seen as an enhancer of interest. This means that interest develops as students learn about the topic they are working with. It is through discovering the accessible learning in a task that students become interested, and willing to place effort in that task. In the present research, 19 interested and non-interested upper secondary biology students were studied in regard to their perceptions of time usage in a 4 hour simulation of natural selection. While non-interested students did not find it worthwhile, the interested students did but did not see any potential in prolonging the time frame for the exercise. This could be due to the available time for the task being set in advance without scope for negotiation or flexibility, but further research is needed to support such claims.

Psychological perspectives on 'negative' interest development in science education

Presenting Author: Niels Dohn, Aarhus University, Denmark; **Co-Author:** Nikolaj Frydensbjerg Elf, University of Southern Denmark, Denmark

There is a distinct lack of theoretical constructs that describe and explain 'negative' interest development, i.e. the transition from a well-developed individual interest in a school science domain toward lack of interest. In this study, we have followed one Danish student through six years. In grade 9, she had a strong interest in school science domains – especially physics. However, through gymnasium (grade 10-12) her interest declined because she felt that physics became more and

more challenging. In order to explain this 'negative' interest development, we suggest that interest in physics instruction is closely related to the students' physics-related self-concept, i.e. the picture students have of their own ability and competence in physics. Our data suggest that this student's feelings of being "insanely challenged" caused a revision in her values and motives through her transition from grade 9 to grade 12, which had a negative impact on her self-concept, resulting in loss of interest. The physics-related self-concept seems to have an important explanatory power for this girl. Thus, we assume when the psychological need for feeling competent is not fulfilled, this has a negative impact on the subject-oriented self-concept, which again can explain how a well-developed individual interest in physics instruction can diminish.

Symposium

Teaching and Teacher Education

Teachers' adaptation to professional challenges and changes in Vocational Education and Training

Keywords: Attitudes and beliefs, Meta-analysis, Motivation, Qualitative methods, Quantitative methods, Self-efficacy, Social interaction, Teacher Professional Development, Vocational education

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Viviana Sappa, Swiss Federal Institute for Vocational Education and Training, Switzerland

Organiser: Viviana Sappa, Swiss Federal Institute for Vocational Education and Training, Switzerland

Organiser: Carmela Aprea, Friedrich Schiller University Jena, Germany

Discussant: Susan Beltman, Curtin University, Australia

Many scholars investigated factors and processes supporting teachers to get a positive adaptation and a successful induction to the profession. In this framework there is a growing interest in investigating how teachers actively cope with professional challenges and changes they experience in their career and which resources support them to stay committed, competent and positively engaged in the profession. However, although primary, secondary and special education school teachers are researched quite widely, very few studies focused on vocational school teachers. This symposium aims at exploring and discussing vocational school teachers' adaptation to professional challenges and changes in different countries. The four papers here collected investigate teachers' adaptation from different and complementary perspectives and by adopting various methodologies. First, several psychological and sociological outcomes and processes relating to a positive adaptation oriented the studies, including resilience (paper 1), professional agency (paper 2), self-efficacy (paper 3), and work engagement (paper 4). Second, qualitative (paper 2), quantitative (paper 3,4) and mixed (paper 1) methodologies were adopted. Third, while two contributions provide a more comprehensive pictures of vocational school teachers (paper 1 and 4), the other two papers focus on specific challenging situations, that is the stream of an educational reforms (paper 2) and the beginning phase of teaching (paper 3). All together the papers contribute to put in light challenges, resources and processes influencing vocational school teachers' adaption and induction to the profession. Peculiarities related to vocational school teachers will be additionally discussed.

Resilient teachers in vocational education and training (VET): a Swiss study.

Presenting Author: Carmela Aprea, Friedrich Schiller University Jena, Germany; **Co-Author:** Viviana Sappa, Swiss Federal Institute for Vocational Education and Training, Switzerland; **Co-Author:** Elena Boldrini, Swiss Federal Institute for Vocational Education and Training, Switzerland

There is a growing interest in investigating teachers who succeed in facing professional challenges and keep positive adaptation despite adversities (i.e. resilient teachers). However, further studies are needed in order to refine the conceptualisation of "resilient teacher" and to clarify how those teachers can be empirically identified. Moreover, despite the increasing interest in focusing on particular categories of teachers (e.g. primary school teachers, secondary school teachers and special education teachers), there is a shortage of studies dealing with vocational school teachers. The study here presented is part of a larger research project investigating resilient teachers in vocational education and training in Switzerland. The first aim of the study is to empirically identify resilient teachers as those keeping positive adaptation despite professional adversities, as defined in the literature. An additional aim is examining which socio-demographic and biographical variables are associated with resilient teachers and which resources contribute to support teachers. A sample of 602 Swiss vocational school teachers (in the Canton of Ticino) took part in the study. Self-reported data about their perceived professional adversity, positive adaptation and perceived resources was collected by an online questionnaire. By means of a cluster analysis five types of teachers were identified, including the 'resilient teachers' who reported high levels of perceived adversity and positive adaptation. Additional analysis revealed differences among the identified profiles with respect to their career-phase. Finally, teaching resources, motivational resources and school-related resources, were showed to be particularly associated to the resilient teachers.

Vocational teachers' professional agency in the stream of change

Presenting Author: Katja Vähäsantanen, University of Jyväskylä, Finland

This study focused on Finnish vocational teachers' professional agency and its connection with positive adaptation in the

stream of an educational reform. Professional agency refers to the notion that teachers affect matters, make decisions, and negotiate regarding their work and their professional identities (including their professional goals and interests). To investigate teachers' positive adaptation to changes from the perspective of professional agency, we conducted a qualitative meta-analysis based on five interview studies. We found that the teachers experienced a lack of influence on the contents and conditions of the reform, and that they therefore expressed resistance and criticism. Despite lacking these kinds of opportunities to enact professional agency, the teachers did not refuse to implement the reform. However, their pathways within the reform varied according to their opportunities to enact agency in respect of their professional identity. The most positive adaptation pathways (involving increased commitment and enthusiasm) emerged when the teachers were truly able to realize their professional interests, or to renegotiate their professional identities to correspond with the changing work, on the basis of pleasant emotions gained during the change. The study provides an agentic perspective on teachers' adaptation in the context of vocational education reforms. To decrease the teachers' resistance to the reforms, and to foster positive adaptations, there is a need to support their professional agency in relation to both reform practices and professional identity.

Vocational school novice teachers' perceptions of school climate and self-efficacy

Presenting Author:Eve Eisenschmidt, Tallinn University, Estonia; **Co-Author:**Merilyn Meristo, Tallinn University, Estonia

Novice teachers' perceptions of school climate and self-efficacy play important role in their decision to stay in profession. Many countries are facing problems related to teacher shortage and teachers leaving the profession. Therefore it is essential to study how novice teachers adapt to professional challenges. The present study explored how novice teachers ($N=112$) perceive the school climate and self-efficacy and how these phenomena are interrelated. However, this paper sets a focus on vocational teachers who were part of the sample. Analysis of variance, correlations and multiple regression were performed. Most school climate aspects correlate positively with self-efficacy aspects. Cohesiveness appeared to play the most predictive role in self-efficacy beliefs. The findings show that vocational school novice teachers have lower self-efficacy beliefs than comprehensive or kindergarten teachers and they also showed lower scores in school climate aspects.

What support vocational teachers' work engagement? Explorative study among Swiss VET teachers

Presenting Author:Viviana Sappa, Swiss Federal Institute for Vocational Education and Training, Switzerland; **Co-Author:**Elena Boldrini, Swiss Federal Institute for Vocational Education and Training, Switzerland

In the field of teacher education there is an increasing interest in understanding how to effectively develop teachers' active engagement and well-committed professional identity. With this respect, several scholars have investigated those individual and contextual resources that foster teachers' work engagement, the latter being defined as a positive, fulfilling, work-related state of mind. However, further studies are needed to examine how individual and contextual resources contribute to support teachers' work engagement particularly in the vocational education and training (VET) context. Based on a preliminary qualitative study, the present contribution aims at exploring how perceived individual and contextual resources impact on VET teachers' work engagement. A total of 64 Swiss teachers were involved in the data collection by means of an online self-reported questionnaire. Work engagement was assessed by using the Utrecht Work Engagement Scale (Schaufeli, Bakker, & Salanova, 2006). In addition, three sets of items were adopted to investigate perceived resources (i.e. school-related resources, teaching-related competences and resiliency resources). Data analysis combined simple and multiple regressions and Structural Equation modeling procedures. Findings show the following effects: a) resiliency resources have the strongest direct and positive impact on work engagement; b) teaching-related competences influence work engagement directly as well as indirectly by fostering resiliency resources; c) school-related resources impact positively on teaching-related competences and resiliency resources; on the contrary they do not have any significant effect on work engagement. Implications for research and teaching education have been outlined.

Session H 16

31 August 2017 10:15 - 11:45

Symposium

Learning and Instructional Technology

Understanding and stimulating children's digital reading

Keywords: Educational Technology, Learning disabilities, Learning Technologies, Multimedia learning, Primary education, Reading comprehension

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Ladislao Salmeron, University of Valencia, Spain

Organiser: Eliane Segers, Netherlands

Discussant: Jean-Francois Rouet, University of Poitiers, France

Understanding reading comprehension of digital documents (e.g. hypertexts or search engine results lists) has been the focus of a respectable body of research. However, we know far less regarding (the process of) children's process such documents, while it has been argued that digital reading comprehension is more difficult than linear (printed) text comprehension. Furthermore, intervention studies aiming at improving children's digital reading comprehension have so far scarce. This is surprising, as digital documents are rapidly becoming the default, also in schools. In the present

symposium, we present four studies. The first is an eye-tracking study comparing good and poor readers in reading search engine results lists, the second on how to improve digital reading comprehension using feedback, and the third and fourth are intervention studies, focusing on strategy usage by means of mind mapping and eye-tracking modelling examples. The symposium has both theoretical and practical implications, as theoretical models of reading comprehension are in need of an extension regarding digital reading, while teachers need evidence-based material to improve reading comprehension instruction of digital texts.

Internet search result viewing in sixth grade students with and without learning difficulties

Presenting Author:Jarkko Hautala, University of Jyväskylä, Finland; **Co-Author:**Otto Loberg, University of Jyväskylä, Finland; **Co-Author:**Carita Kiili, University of Oslo, Norway; **Co-Author:**Paavo Leppänen, University of Jyväskylä, Finland

This study aims at clarifying how sixth grade students with or without learning difficulties evaluate search results on the Web. The relevancy of the search results' components in respect to a given information search task was being manipulated, and eye movements were being recorded. Students' probabilities to look at each component during the initial and later encounter with the search result were analyzed. It was found that if a result had an irrelevant title, its snippet was often not looked at all during the first-pass viewing. This shows a usage of an eliminative reading strategy. During later viewing passes, all of the components of the best-matching search result were typically looked at, indicating a usage of a confirmatory reading strategy. Cluster analysis revealed three groups with different viewing strategies: 1) a group reading mostly titles, 2) a group reading titles and snippet text, and 3) a group reading all three available components. The title readers much more often chose competing search results instead of the best one. Children with reading difficulties were over-represented in the title readers -group, and performed overall quite poorly in the task. Students with attention difficulties started to make more errors towards the end of the experiment relative to the control group. Overall, the results suggest that sixth graders vary considerably in their information searching skills, which could likely be improved by targeted instruction. Such instruction may be especially beneficial for children with reading difficulties.

The effects of different types of online feedback on reading comprehension of highschool children

Presenting Author:Tami Katzir, University of Haifa, Israel; **Co-Author:**Einat Tesler, University of Haifa, Faculty of Education, Israel; **Co-Author:**Michal Shany, University of Haifa, Israel

This study aims to examine how 10th grade children respond to a computer based reading comprehension program using different types of feedback conditions. A sample of 120 10th graders participated in an online reading comprehension training program in which they read texts and answered questions as well as rated their confidence on the tasks. They were randomly assigned to one of three on line feedback conditions: 1) feedback on *performance*. 2) Feedback on *performance + CoC (calibration of comprehension)*. 3) Feedback on *performance + a text cue* for wrong answers. Time on task and online reading strategies (# of returns to text) were reported. Overall, preliminary pilot analyses suggest that strong readers made gains in terms of CoC and performance across the three conditions. Poor comprehenders benefited only from the text cue feedback in terms of performance but not CoC. Results highlight the importance of specific online feedback and the need to further understand ways to improve self regulation in poor readers.

Strategy training and mind-mapping facilitates children's digital text comprehension

Presenting Author:Eliane Segers, Radboud University Nijmegen / University of Twente, Netherlands; **Co-Author:**Sabine Fesel, Radboud University, Netherlands; **Co-Author:**Linda de Leeuw, Radboud University, Netherlands; **Co-Author:**Ludo Verhoeven, Radboud University Nijmegen, Netherlands

In perspective of literacy skills for the 21st century, children in primary school read hypertext for comprehension. However, children typically are taught reading strategies for linear text, while these strategies are not automatically transferrable one-to-one to hypertext. In the present study, a training group of 55 sixth-graders were taught four hypertext reading strategies (planning, monitoring, evaluation and elaboration) via mind mapping and the usage of a prompting paper-card. A control group of 29 children received no strategy training. We examined to what extent strategy training influenced children's strategy use and learning outcomes: (1) number of pages read and reading time per text, (2) explicit / implicit reading comprehension scores and (3) knowledge representations (relatedness judgment task and mind maps). At posttest, the training group showed higher scores on a self-reported strategy usage questionnaire, higher comprehension scores, and more advanced mind maps as compared to the control group. It can be concluded that hypertext strategy training in combination with mind-mapping supports children's hypertext comprehension.

Learning to construct navigable concept maps with eye-movement modelling examples

Presenting Author:Ladislao Salmeron, University of Valencia, Spain; **Co-Author:**García Victoria, University of Valencia, Spain; **Co-Author:**Franck Amadiou, University of Toulouse, France

Navigable concept maps are a hybrid document that combines hypertext and concept maps (Amadiou et al., 2015), in which readers not only navigate between hypertext nodes, but also create links between such nodes to create a concept map. Preliminary studies revealed that teenagers confront comprehension difficulties with such format, as compared to a hypertext with non-navigable maps (García, Salmerón, Amadiou, & Cegarra, 2013). In this study we tested an instructional program to teach teenagers how to navigate and create maps. Specifically, our program included the phases for the construction of concept maps (planning, organizing and reviewing) developed by Hilbert and Renkl (2009), to which we incorporated a navigation phase. Two groups of sixth graders were randomly assigned to the two conditions. The control

group discussed in pairs a series of videos depicting students' actions and verbalizations while navigating and constructing maps. The experimental group followed a similar procedure, but added to the videos the students' eye-movements (EMMEs). In the pre and post test sessions students created a navigable concept map using the Cmaps tool. No difference between groups was observed for an immediate comprehension test. Students from the EMMEs group identified better the phases illustrated in the videos during the intervention, and wrote better one-day delayed summaries of the hypertexts in the post-test. Those results indicate that EMMEs are a powerful instructional tool to instruct reading and navigation in complex digital formats.

Symposium

Educational Policy and Systems

Learning to learn in Italy and in Latin America

Keywords: Competencies, Learning approaches, Metacognition, Self-regulation

Interest group: SIG 16 - Metacognition

Chairperson: Sirkku Kupiainen, University of Helsinki, Finland

Organiser: Cristina Stringher, Istituto Nazionale per la Valutazione del Sistema Educativo di Istruzione e di Formazione (INVALSI), Italy

Discussant: Amparo Moreno, Universidad Autonoma de Madrid, Spain

Our symposium aims to provide an initial overview of research on Learning to learn in Italy and in Latin American countries. The symposium stems from the initial phase of a wider project aimed at understanding the development of this key competence in different cultures, in order to sustain its acquisition with pertinent interventions throughout school grades and beyond. It is known that school systems seem to thwart Learning to learn competencies in children and adolescents (Deakin Crick, et al, 2007; Goldspink & Foster, 2014; Hipkins, 2015; OECD, 2010) and that interventions, as large and deep as they can be, struggle to make a difference in untouched education (Goldspink & Foster, 2014; Higgins et al, 2010; James et al, 2007; Montessori, 1948/1999). Possibly, Learning to learn might even be at odds with current curricula delivery modes around the world. This symposium originates from a systematic literature review carried out with the same methodology in all participating countries: Italy (coordinating country) plus all twenty Latin American countries. Symposium presenting countries are four. A quite unique conception of learning to learn emerges in these countries, with deep implications for policy, research, and practice. Results are discussed according to past (Bateson, 1977; Hounsell, 1979; Smith et al, 1990) and current Learning to learn research (Deakin Crick et al, 2014), paying attention to its core components (Demetriou, 2014; Hautamäki & Kupiainen, 2014; Kupiainen, Hautamäki & Rantanen, 2008; Moreno & Martín, 2014; Stringher, 2014a; 2014b), to its determinants and pre-requisites from early childhood onwards (Rao et al, 2014; Stringher, 2016). Bibliography and Fig. 1 with quantitative results of the literature search are attached.

Learning to learn in Italy and in Latin America: a systematic literature review

Presenting Author: Cristina Stringher, Istituto Nazionale per la Valutazione del Sistema Educativo di Istruzione e di Formazione (INVALSI), Italy

This presentation sets the stage for subsequent symposium contributions. Italy is providing the research background against which the literature review has been conducted. Each presenter in the symposium is developing the central theme according to a specific viewpoint. In 2014, Deakin Crick, Stringher and Ren edited the book *Learning to Learn. International perspectives from theory and practice*. The book collected significant experiences from twenty authors in eleven countries and four continents. In spite of this massive effort, learning to learn lacked a shared understanding among book authors. In 2015, the need to deepen knowledge on Learning to learn emerged from schools in Italy. From this need, INVALSI drafted an international project. Its focus is to understand the development of this key competence in different cultures, in order to sustain its acquisition. The symposium will refer to the first project phase: the systematic literature review carried out in 2016 in order to inform the theoretical framework of the entire project. This paper in particular reports on the international review methodology and initial outcomes. Italian and Latin American references mainly deal with theoretical issues and very few are the empirical studies. The main difference lies in the depth of theoretical arguments, with a few Latin American studies tackling the challenge to define the concept in a wide conception according to Hounsell (1979). The presentation addresses the other results of the review by research question and concludes with relevant policy and practice contributions to the learning to learn research agenda.

Learning to learn in Mexico

Presenting Author: Hugo Armando Brito Rivera, Metropolitan Autonomous University, Mexico

This study has been conducted with the same methodology already presented in the first contribution within the overall project. Results are based upon forty references selected based on the shared research criteria and reported according to research questions. Learning to learn in Mexico seems a quite developed field of study which deserves the attention of the international community for its breadth and depth. The paper addresses historical roots of the concept in the reviewed Mexican literature and presents current research, experiences and research tools developed locally. Learning to learn in the

70's was conceived around two problematic areas: a) the obstacles and personal limitations (disorganization, inconsistency, etc.); b) the development of critical thinking. Currently, the need for this competence stems from the complexity of contemporary societies. Nationally, several works have been developed around strategies, resources and exercises linked to learning to learn at all levels of education. Such a set of works, theoretical and practical, is divided into two types; a) contributions focused on activities for students; b) texts aimed at teachers. Another group of studies focuses on the reflection and analysis of the institutional change needed in order to make learning to learn a central element in schools and universities, in a collaborative effort typical of organization studies, whose actors are organized in communities of practice, for the development of shared competence and organizational learning. Critique on Mexican conceptions of this competence yield to the need to further examine it theoretically and empirically.

Learn how to learn in Brazilian intellectual production

Presenting Author: Claudia L. F. Davis, Fundação Carlos Chagas // PUC-SP, Brazil

This paper aims to analyze how the studies about 'learning to learn' are displayed in Brazilian intellectual productions, reviewing articles and books published from 2000 to 2016. Two perspectives were found: cognitive psychology sees 'learning to learn' as the acquisition, mastery and use of cognitive and metacognitive strategies, encouraging continuous learning throughout life in order to promote student's autonomy and independence; (b) the historical materialist and dialectical view, emphasizing the social nature of education, criticizes the prevailing notion of learning for focusing in individual processes, disregarding the contents of public schooling and the reasons why they must be learned. The former perspective, in this view, is seen only as an ideological subterfuge of capitalism to improve the ruling class education, making the one offered to the dominated class innocuous. The two perspectives go in parallel, without profiting from a dialogue between them. In such circumstances, knowledge about 'learning how to learn' difficultly will progress and those who work at school will hardly benefit from its findings.

Components of learning to learn in Italy and in Latin American countries

Presenting Author: Paolo Di Rienzo, University Roma Tre, Italy; **Co-Author:** Estefania García González, University of Valladolid/University of Roma Tre, Spain

Learning to learn is not univocally conceived in scientific literature. However, this concept is playing an important role in most education policies, and constitutes one of the main bricks of knowledge societies. Our study is focused on the current understanding of the Learning to learn concept in Latin America. To this aim, the research group performed a systematic literature review of scientific articles addressing this topic in Latin American countries. In this paper we report on a specific aspect of the literature review: the analysis of Latin American definitions. For our purpose, we used the resources published by Latin American authors that have been collected and selected by the research group according to the overall project methodology as detailed in Stringher's presentation within this symposium. From this database, we further selected articles with definitions of Learning to learn (whenever present) and constructed an analysis table. Finally, we performed a qualitative analysis on the identified definitions with respect to the Learning to learn components according to Stringher (2014). The results of our research show important differences between Latin American countries concerning the understanding and definition of Learning to learn. From a general perspective, the state-of-the-art Learning to learn components are not explicitly mentioned in most of the analyzed contributions. However, we could observe some aspects closely related to the topic, such as the cognitive, metacognitive, affective and social dimensions. We conclude by suggesting further work on the conceptualization of Learning to learn for its assessment in Italy and in Latin American countries.

Symposium

Assessment and Evaluation, Higher Education, Learning and Instructional Technology, Learning and Social Interaction

Advances in the Assessment of Scientific Reasoning and Argumentation Across Disciplines

Keywords: Argumentation, Assessment methods and tools, Collaborative Learning, Conceptual change, Conversation / Discourse analysis, Higher education, Learning Technologies, Mathematics, Problem solving, Qualitative methods, Quantitative methods, Reasoning, Secondary education, Student learning, Teaching / instruction

Interest group: SIG 01 - Assessment and Evaluation, SIG 07 - Learning and Instruction with Computers, SIG 26 - Argumentation, Dialogue and Reasoning

Chairperson: Ingo Kollar, University of Augsburg, Germany

Discussant: André Tricot, University of Toulouse, France

Scientific reasoning and argumentation are widely seen as important skills. First, they are necessary to develop explanations for natural and social phenomena and can act as a motor for triggering conceptual change. Second, students as young citizens need scientific reasoning and argumentation skills to be able to effectively participate in science-related and societal debates. And third, many professional problems (e.g., such as how teachers might support student learning in an evidence-based manner) can only be solved competently by aid of scientific reasoning and argumentation skills. Current research on scientific reasoning and argumentation is characterized by an intensive debate that centers around three

interrelated questions: (1) How can scientific reasoning and argumentation skills be measured in an objective, reliable and valid way? (2) Is judging the quality of scientific reasoning and argumentation processes and skills dependent on the specific discipline in which it takes place or do also domain-general facets exist? (3) How can learning analytics be used to make phenomena in the natural world visible to help problem-solvers engage in higher levels of scientific reasoning? This symposium assembles four papers that shed light on these questions by uncovering and critically discussing innovative ways to assess and support scientific reasoning and argumentation in different domains such as mathematics, education, and the life sciences. The goal of the symposium is to explore new ways of assessing scientific reasoning and argumentation skills to inform future research regarding the development of objective, reliable and valid measurement tools.

Productive argumentation for conceptual change learning

Presenting Author:Christa Asterhan, Hebrew University of Jerusalem, Israel

In this contribution, I focus on argumentation for subject-matter learning that requires the transformation of misconceived knowledge about natural phenomena towards the scientifically accepted, canonical account (conceptual change). In this line of research, "high quality argumentation" is defined empirically and *ad hoc*. Those dialogue features that are associated with learning gains are defined as productive. Through a line of empirical studies we have identified three features of productive argumentation for conceptual change: Critical reasoning, supportive collaborative interpersonal regulation, and a content-specific focus on key conceptual issues. We present coding schemes to assess these features and discuss the implications for educational design and theory.

Conceptualizing content-related and formal quality aspects of mathematical argumentation and proof

Presenting Author:Sarah Ottinger, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Stefan Ufer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Ingo Kollar, University of Augsburg, Germany; **Co-Author:**Freydis Vogel, Technical University of Munich (TUM), Germany; **Co-Author:**Matthias Schwaighofer, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Ilka Terwedow, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Anselm Strohmaier, Technische Universität München, TUM School of Education, Germany; **Co-Author:**Kristina Reiss, Technische Universität München (TUM), Germany; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

Mathematical argumentations are characterized not only by their deductive nature, but also by their formal presentation using variables and logical symbols. Students at all educational levels struggle with mathematical argumentation and proving. Constructing elaborate mathematical argumentations and proofs requires both the ability to find deductive lines of single arguments as well as skills to communicate these argumentations in a formally correct way according to mathematical standards. Even though these two sub-processes are intensively discussed in the literature, it is yet unclear to what extent they can be seen as independent from each other. In a study with $N=159$ students at the transition phase from secondary to tertiary education, students were asked to generate argumentations in elementary number theory. We examined the quality of the content of mathematical argumentations and the quality regarding several formal aspects of their presentation as well as relations between the different quality indicators. The study replicates students' problems in constructing mathematical argumentations. Moreover, the results indicate that not all, but some aspects of formal quality are related to the quality of the content of the argumentation which is presented. We discuss ways to conceptualize and operationalize different quality aspects of mathematical argumentation as well as implications of the results for further research.

Differential item functioning and bifactor model analyses in evaluating scientific reasoning tests

Presenting Author:Ansgar Opitz, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Moritz Heene, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Frank Fischer, Ludwig-Maximilians-Universität (LMU), Germany

Despite the importance of assessing higher education competencies in general and scientific reasoning in particular, past analyses in these areas have not used complex analytical designs. In this study, differential item functioning (DIF) and bifactor model analyses are used to evaluate the domain generality assumption of a scientific reasoning test and the overlap between scientific and general reasoning, respectively. A scientific reasoning test and three general reasoning scales were administered to 507 university students. The DIF analyses revealed up to five biased items most of them favoring biology students. In a traditional comparison of means, physics students had significantly higher scores, though. In the bifactor analysis, the scientific reasoning factor kept almost no unique variance after general reasoning had been controlled for. The overlap was less strong in traditional regression analyses. Thus, the newly deployed statistical methods provided insights that reached beyond statistical methods that were used in the past to analyze scientific reasoning tests. According to the results from these new methods, it is not possible to measure scientific reasoning in a completely domain-general way and the overlap between scientific reasoning and general reasoning is larger than previously thought.

Teacher reasoning about collaborative learning: the role of learning analytics

Presenting Author:Anouschka van Leeuwen, Utrecht University, Netherlands; **Co-Author:**Jeroen Janssen, Utrecht University, Netherlands; **Co-Author:**Gijsbert Erkens, Utrecht University, Netherlands; **Co-Author:**Mieke Brekelmans, Utrecht University, Netherlands; **Co-Author:**Ingo Kollar, University of Augsburg, Germany

Teachers support is essential for collaborative learning to be successful. In turn, teachers need to be able to reason about

how to support students based on scientific theories and evidence. Teachers may be stimulated to do so when students' collaborative interactions are judged in an objective and reliable way. Learning analytics, the automated analyses and visualization of student data, could be a means to do so by analyzing and aggregating data about students in specific ways. By means of a simulation study, we investigated the effects of providing teachers with learning analytics. It was found that the mean frequency of interventions was significantly higher when teachers had access to LA, and that their interventions were relatively more often directed at problematic groups than at non-problematic groups. The study showed how even simple analytics of student activities influenced teacher reasoning about student collaboration. An important direction for future research is to consider in what ways learning analytics could play a role for teacher professionalization in terms of more advanced analyses and visualizations of student data.

Symposium

Motivational, Social and Affective Processes

Measuring and supporting collaborative learners' engagement in shared regulation processes

Keywords: Collaborative Learning, Metacognition, Peer interaction, Self-regulation, Social interaction, Technology, Video analysis

Interest group: SIG 16 - Metacognition

Chairperson: Hilde Van Keer, Ghent University, Belgium

Discussant: Deborah Pino-Pasternak, Murdoch University, Australia

Shared regulation of learning has been recognized as a new and growing field in metacognition research. Despite consensus on the importance of collaborative learners' shared regulative engagement, empirical evidence is still minor and distributed. Prior research focused on conceptualizing and validating the construct of shared regulation by identifying the latter in single learning contexts. Although providing us with innovative insights, previous studies equally raised questions regarding the generalizability of findings, the existence of different types of shared regulation, the learning dynamics evoking shared regulative acts, developmental evolution patterns of shared regulation, or how to support collaborative learners' shared regulative engagement. The present symposium aims at taking the research on shared regulation to the next level by presenting innovative findings derived from new empirical directions mentioned above. By comparing collaborative learners' regulation across contexts (both within and between studies), the symposium implies a first step towards generalizing results on shared regulation. The identification of variations in shared regulation further allows discussing and studying the potentially different impact of regulation acts on the quality and outcomes of collaborative learners. Further, by addressing developmental patterns as well as facilitative instructional designs eliciting learners' shared regulation, the symposium provides valuable input on how to (re)design collaborative learning interventions, allowing to scaffold their regulative potential to the fullest. Combining insights from video-based analyses conducted in a variety of settings further unravels important methodological guidelines and challenges. The symposium consequently advances both the theory and future research on shared regulation.

Metacognitive regulation during collaborative learning: does sharing always imply quality?

Presenting Author: Liesje De Backer, Ghent University, Belgium; **Co-Author:** Hilde Van Keer, Ghent University, Belgium;

Co-Author: Martin Valcke, Ghent University, Belgium

The present study investigates higher education collaborative learners' adoption of socially shared metacognitive regulation (SSMR) during reciprocal peer tutoring (RPT). Sixty-four Educational Sciences students participated in a semester-long RPT-intervention and tutored one another in small groups of six. All sessions of five randomly selected RPT-groups were videotaped (70h of video recordings). The focus of the study is twofold, directed at both identifying time-bound evolutions in RPT-groups' adoption of socially shared metacognitive regulation (SSMR) and at unravelling possible quality differences in identified utterances of SSMR. Multilevel logistic regression models allowing change points are adopted to study evolutions over time. A coding rubric is developed to investigate qualitative differences in engagement depth with shared regulation activities. The results indicate that RPT-participants significantly enhance their adoption of SSMR as the RPT-intervention progresses. They especially engage in shared regulative acts during orientation and monitoring activities. The results further reveal differences in the quality of identified SSMR-acts, based on the number of RPT-participants engaged in a shared regulation activity and the level of elaboration in RPT-participants' regulative contributions to SSMR-acts.

Supporting intra-group social metacognitive activities with technology: a grammar learning game

Presenting Author: Inge Molenaar, Radboud University Nijmegen, Netherlands; **Co-Author:** Anne Horvers, Radboud University Nijmegen, Netherlands; **Co-Author:** Peter Desain, Radboud University, Netherlands

This study investigates the effects of a technology enhanced collaborative grammar learning activity on students sentence parsing and formulation. These types of collaborative learning activities for grammar education are expected to support more effective learning. Yet, effective intra-group social metacognitive activities are essential for effective group learning. Groups engaged in these activities often fail to engage in collaborative control and monitoring of their learning. In this study, we examine how a technology enhanced game can support intra-group social metacognitive activities during a

collaborative learning activity to practice sentence generation and parsing. Results indicated that students indeed improved on aspects of sentence parsing, namely the naming of the direct subject in sentence parsing over time. Also, an improvement was seen in naming the direct verb in parsing and in the use of the subject, direct verb and indirect object in the formation of sentences. Finally clear examples were found where the technology design supported high quality intra-group interaction on cognitive and metacognitive levels.

Metacognitive regulation in collaborative science learning across different contexts

Presenting Author:Tuike Iiskala, University of Turku, Finland; **Co-Author:**Simone Volet, Murdoch University, Australia; **Co-Author:**Milo Koretsky, Oregon State University, United States; **Co-Author:**Cheryl Jones, Murdoch University, Australia; **Co-Author:**Marja Vauras, University of Turku, Finland

Research on metacognitive regulation, such as socially shared metacognitive regulation (SSMR), in collaborative learning has been studied with a broad array of analytic methods, but to date empirical work has been limited to the study of single contexts. Comparing findings across different contexts is needed to advance our understanding of, and further validate the construct of metacognitive regulation, including SSMR, in collaborative learning. The aim of this paper, therefore, is to examine how metacognitive regulation manifests itself in student groups' collaborative learning across several contexts, using the same analytical approach. The participants were groups of high-school students from Finland (general science), and university students from Australia (second year veterinary science) and the USA (final year engineering). One low-outcome and one high-outcome group from each research site were selected. Recordings of the groups' verbal interactions were coded for evidence of metacognitive regulation, including SSMR. Reliable inter-coding agreement between researchers was achieved. Statistical significance was determined using non-parametric tests, and differences in coding distributions were evaluated using logistic regression. Findings from the high school and the second year university veterinary site were similar in that in both sites the high-outcome group displayed a higher proportion of metacognitive regulation and SSMR than the low-outcome group, but this was not the case for the engineering data. A developmental pattern in SSMR also emerged across levels of education with lowest engagement in SSMR among high school students and highest among final year university students. In-depth comparisons and tentative explanations for the context-related differences are discussed.

Socio-cognitive and socio-emotional monitoring in collaborative learning

Presenting Author:Piia Naykki, University of Oulu, Finland; **Co-Author:**Jaana Isohätälä, University of Oulu, Finland; **Co-Author:**Sanna Järvelä, University of Oulu, Finland

The aim of this study is to examine social regulation in collaborative learning, particularly how socio-cognitive and socio-emotional monitoring processes emerge and function during student teachers' collaborative inquiry learning. The participants of this study were first-year teacher education students whose collaborative learning was supported with a designed macro-script during a six weeks environmental science course. The script divided the group work into three phases, namely: orientation-phase, intermediate-phase and reflection-phase. The script was put in use by prompting questions that were delivered to the students by utilizing iPads. Question prompts instructed groups to stop and reflect on their thoughts and to consider the efficiency of their strategies. The groups' face-to-face work were video-taped with spherical 360 degree cameras. The results show that the students used the provided macro-script more thoroughly in the orientation-phase than later phases. More active script discussion was followed by more active socio-emotional monitoring. It can be concluded that more profound regulation processes can be enhanced with a theory-based script that supports students' interaction about cognitive, metacognitive, motivational and emotional group processes.

Session H 20

31 August 2017 10:15 - 11:45

Main Building D - D13

Symposium

Learning and Social Interaction, Teaching and Teacher Education

Explaining Differences in Teacher Expectations and their Effects on Student Outcomes

Keywords: At-risk students, Attitudes and beliefs, Educational Psychology, Primary education, Quantitative methods, School effectiveness, Social aspects of learning and teaching, Social interaction, Student learning, Teacher Effectiveness, Teaching / instruction

Interest group: SIG 10 - Social Interaction in Learning and Instruction, SIG 11 - Teaching and Teacher Education

Chairperson: Petra Stanat, Humboldt-Universität zu Berlin , Germany

Organiser: Camilla Rjosk, Humboldt-Universität zu Berlin , Germany

Organiser: Anneke Timmermans, University of Groningen, Netherlands

Discussant: Sabine Krolak-Schwerdt, University of Luxembourg, Luxembourg

Teacher expectations guide behaviour during instruction, form a basis for student support, grouping, and choice of learning material. Accurate to high expectations are favorable for adaptive instruction and can positively affect future student achievement. Based on common theories and empirical findings on teacher expectations and self-fulfilling prophecies (e.g., Jussim, Robustelli, & Cain, 2009; Rosenthal & Jacobson, 1968), the four studies presented in the proposed symposium expand our knowledge on characteristics related to teacher expectations, their stability, and underlying mediating

processes for student achievement at different levels (see Figure 1). The empirical studies carried out in four countries investigate primary school teachers and their students predominantly using longitudinal designs and elaborated regression methods. The first two studies explore accuracy and stability of teacher expectations and their association with teacher-student relationships. The last two studies investigate effects of teacher expectations on student outcomes at the student and school level and their underlying mechanisms. The symposium provides insights into how teacher expectations function and into beneficial or detrimental consequences in the classroom. The findings will be discussed from the perspective of educational psychology.

Jussim, L., Robustelli, S., & Cain, T. (2009). Teacher expectations and self-fulfilling prophecies. In K. Wentzel & A. Wigfield (Eds.), *Handbook of Motivation at School* (pp. 349–379). New York: Routledge. Rosenthal, R., & Jacobson, L. (1968). Pygmalion in the classroom. *The Urban Review*, 16–20.

Stability of Teacher Expectations: A Longitudinal Examination

Presenting Author:Christine Rubie-Davies, University of Auckland, New Zealand; **Co-Author:**Elizabeth R Peterson, University of Auckland, New Zealand; **Co-Author:**Penelope Watson, The University of Auckland, New Zealand; **Co-Author:**Annaline Flint, University of Auckland, New Zealand; **Co-Author:**Lynda Garrett, The University of Auckland, New Zealand; **Co-Author:**Lyn McDonald, The University of Auckland, New Zealand

There is a paucity of research that has examined the stability of teachers' expectations across a single year and there are no longitudinal studies. The current study examined the stability of 88 teachers' expectations within three separate years at two time points each year and across three years (six time points) in mathematics and reading. In both subject areas, teachers' expectations remained stable from the beginning to the end of the year for each separate year of the study. However, teachers who had under- or overestimated their students by more than half a standard deviation over one year, became less extreme in their views over three years. Nonetheless, the under-estimators continued to underestimate their students albeit to a lesser degree at every time point in both reading and mathematics. Similarly, the over-estimators remained positive in their predictions of student achievement. The educational and theoretical implications of the findings are discussed.

The Interpersonal Character of Teacher Expectations

Presenting Author:Anneke Timmermans, University of Groningen, Netherlands; **Co-Author:**Christine Rubie-Davies, University of Auckland, New Zealand; **Co-Author:**Greetje van der Werf, GION - University of Groningen, Netherlands

Teacher expectations of students have long been recognized as a form of interpersonal expectation. Although it is assumed that the teacher's perceived teacher-student relationship is principally influential in educational decisions, the marks that are given, and as a source of information on which to build expectations, these constructs have rarely been investigated simultaneously. In this study, we aimed to investigate the interpersonal character of teacher expectations by analyzing the association between teacher expectations and the dimensions closeness, conflict and dependency of the teacher-student relationship based on a large sample of 5,836 students and 400 classes in the final grade of Dutch elementary schools. The results indicated that teacher expectations and the dimensions closeness and conflict shared similar antecedents in terms of demographic student characteristics. Perceived closeness positively predicted teacher expectations but only for minority students. A negative association was found for both perceived conflict as well as dependency with teacher expectations, although the latter relationship appeared stronger for high performing students. These results underline teacher expectations as an interpersonal construct, and indicate the power of the dyadic teacher-student relationship to influence teacher expectations, and the importance of a close teacher-student relationship, especially for minority students.

Effects of Teacher Expectations on Teacher Behaviour and Students' Achievement Development

Presenting Author:Sarah Gentrup, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Georg Lorenz, Berlin Institute for Integration and Migration Research, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Susanne Rahmann, Universität Mannheim, Germany; **Co-Author:**Petra Stanat, Humboldt-Universität zu Berlin, Germany; **Co-Author:**Cornelia Kristen, Otto-Friedrich-Universität Bamberg, Germany; **Co-Author:**Irena Kogan, Universität Mannheim, Germany

Previous research has established that biased teacher expectations can influence students' achievement development (see Jussim & Harber, 2005). Whereas the earlier studies focused on upper grades, exploring the relationship after a significant period of teacher-student-contact, research that starts at the beginning of first grade is rare. Moreover, little is known about the mechanisms whereby teacher expectations are transmitted during instruction. Based on data from $N = 1,039$ students from $N = 65$ classes in Germany, part 1 of this study examined whether biased teacher expectations predicted students' achievement gains in reading and mathematics during first grade. In part 2, we investigated how teacher expectations played out in teacher behaviour by performing in-depth analyses of videotaped German and math lessons from a subsample of $N = 19$ classes ($N = 352$ students). The results from part 1 of the study suggested that teacher expectations had an effect on students' year-end performance in reading and mathematics. More detailed analyses, based on categories of over- and underestimation, revealed that overestimations were associated with larger increases of students' skills in both reading and mathematics. Negative effects of underestimations were found for reading. The results of part 2 of the study indicated that teacher behaviour varied depending on teacher expectations. High-expectancy students received more positive feedback from their teachers, in the reading domain, even after controlling for students' prior achievement. In turn, the amount of positive feedback was associated with students' achievement gains.

Merton Scores Twice: Teacher Expectations as Self-fulfilling Prophecy and Matthew Effect

Presenting Author:Orhan Agirdag, KU Leuven, Belgium

Previous studies demonstrate that school SES is related to pupils' academic achievement. That is, pupils who attend high SES schools are found to perform better than similar pupils in low SES schools. More recently, scholars revealed that process variables such as teacher expectations mediate effects of school SES. This study builds further on this research on teacher expectation effects while it contributes with novel aspects. Most importantly it examines school composition and teacher expectations effects while controlling for student ability (IQ) with longitudinal data and it investigates neglected moderation effects. Data from 67 schools in Flanders show that school SES is related to science achievement growth, and this holds true even after controlling for previous achievement, pupil-level SES and IQ. In line with previous studies, it is revealed that school-level teacher expectations mediate the effects of school SES. Moreover, the interaction term between school SES and school-level teacher expectations is also significant, which shows that teacher expectations moderate the impact of school SES. It seems that teacher expectations not only function as self-fulfilling prophecies that explain why pupils in high SES schools perform better, but they also cause a Matthew effect as pupils enrolled in high SES schools accumulate advantages because they are exposed to higher teacher expectations.

Symposium

Teaching and Teacher Education

Context, support and agency in new teachers' induction and learning

Keywords: Attitudes and beliefs, Case studies, Communities of practice, In-service teacher education, Mixed-method research, Motivation, Peer interaction, Qualitative methods, Quantitative methods, Teacher Professional Development, Workplace learning

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Tsafirir Goldberg, University of Haifa, Israel

Discussant: Jan Vermunt, University of Cambridge, United Kingdom

New teachers' induction is a crucial phase in the teaching career. It serves as a formative stage both in terms of developing a professional identity and in terms of on the job learning. Individual agency and environmental support determine the degree to which new teachers realize the potential for professional learning and professional identity formation. Social-cultural contexts may have strong influence both on norms of support and on new teachers' perceptions of agency and learning patterns, thus calling for cross-cultural comparative perspectives. Our aim is to glean the insights that can be gained from contrasting different contexts and different methods we used to explore the ways new teachers learn their practice, shape and come to terms with their role and place. The proposed symposium brings together findings from Holland, Israel and Belgium, and looks both at majority members and at ethnic minorities. It features a range of methodologies, spanning from in-depth qualitative analysis of individual career narratives to wide scale quantitative analyses of social networks and learning patterns. The preliminary findings point to the complex inter-relation between teachers' individual agency and identity and the school norms and frameworks of support. We also find that, while institutional induction initiatives bear surprising resemblances across countries, school norms and teachers' strategies show uniqueness and diversity. The cross-cultural perspective allows us to point possible trajectories for a more nuanced and adaptive induction initiatives.

Is initiative an indicator of neglect? Social context, support, and new teachers' learning patterns.

Presenting Author:Tsafirir Goldberg, University of Haifa, Israel

School and community are assumed to deeply influence new teachers' induction into practice. However, not enough is known about the way these contexts actually shape or interact with new teachers' ways of learning. While there are clear theoretical assumptions about the best practices for teacher learning, for example through professional learning communities, it is unclear whether such practices are feasible for all contexts. Nor is it established that all new teachers opt for such learning, or what new teacher learning strategies lead to better performance. This study explores the relations of school contexts (age, ethnic sectors, socio-economic status) with new teachers perceived support and learning patterns. Using structural equation modeling it traces the complex relations between context, learning patterns, and new teachers' appropriation of professional knowledge and performance. Findings show that in minority and lower SES contexts new teachers reported lower support, and opted for more individualistic learning patterns. Context moderated the relation of new teachers learning patterns with appropriation of professional knowledge and its enactment. In Supportive contexts, new teachers' collegial learning was associated more strongly than individualistic learning with acquiring professional knowledge and with better performance. In less supportive contexts, individualistic learning patterns were just as strongly related to professional knowledge and performance and in some aspects new teachers showed more initiative. We discuss the significance of findings for creating more nuanced induction frameworks, adapting them both to context and to new teachers' learning preferences.

How does the guidance offered to newly qualified teachers determine their collegial network?

Presenting Author: Simon Beusaert, Maastricht University, Netherlands; **Co-Author:** Sanne De Vos, Odisee, Belgium; **Co-Author:** Johan De Wilde, Odisee, Belgium; **Co-Author:** Chloé Meredith, KU Leuven, Belgium

Lack of support is one of the reasons why newly qualified teachers (NQTs) tend to leave the job during their first years. Previous research made a distinction between support structure and support culture. Support structure can be defined as the induction programs that are aimed at guiding NQTs, e.g. mentoring. Support culture is related to the informal support NQTs get, e.g. the exchange of advice. Studies show that a wider network of support is related to a greater level of commitment. A support culture that focusses on equality amongst novice and experienced teachers and on reciprocal cooperation and thus support by the *social network* may be sufficient to cope with high drop-out rates among NQTs. However, few is known on the relation between support structure and culture. It is unclear how support structures contribute to the support culture of NQTs. The aim of this study is to investigate this relation and to unravel how support structures contribute to the network of NQTs. Data from 443 NQTs with less than 3 years of experience were collected and are going to be analyzed in Egonet. To gain more insight 14 NQTs will participate in interviews on the determinants and effects of their collegial network. At the EARLI 2017 results and contributions to the professional learning during the early career stage will be discussed.

Tensions of beginning teachers: Professional Identity and Agency at work

Presenting Author: Merel van der Wal, Radboud University Nijmegen, Netherlands; **Co-Author:** Harmen Schaap, Radboud University Nijmegen, Netherlands; **Co-Author:** Helma Oolbekink-Marchand, Radboud University Nijmegen, Netherlands

This study reveals how tensions of beginning teachers experience are at work between their professional agency and to who they want to be as teacher. To study teacher agency 54 teachers from secondary education filled out a log three times during one school year about their professional agency, about the image they have of themselves as a teacher and their tensions. The results show that most teachers experience agency in the school to develop professionally but they also experience tensions due to the many tasks they have to fulfil and the high demands they place on themselves as teachers. Consequently, beginning teachers perceive that they have to teach in way which does not align with who they want to be as a teacher.

Sliders: parallel universes of novice teachers' entrance and learning of the profession

Presenting Author: Tal Palevsky, University of Haifa, Israel

In their first years of teaching, novices are required to learn how to handle various new challenges. The present research aims to expand research on novices' "on-job" learning in the context of their habitat and from a social-cultural perspective. Thus, this research addresses the need to investigate novices' professional identity construction in relation to their learning and the social-cultural context, as they become teachers and negotiate their place in their school. From this perspective, we also examine the connections between learning and performance, which have not been sufficiently researched. The suggested paper for this conference presents contrasting school habitats, which influence novice teachers' learning and identity construction, demonstrating parallel universes of novices' entrance to the educational system. It also reveals a vicious circle, connecting between novices functioning and learning, indicating that a teacher who is in a survival state and barely functions, isn't available for learning and thus remains in survival, eventually "dropping-out" of the profession. This research is part of a large research program on novice teachers' learning in Israel. The present research relies on a qualitative approach, consists of teachers in Jewish Israeli schools and combines research tools (questionnaires, observations and interviews).

The research addresses a call to expand research on the relations of context, learning and professional identity. Through examining contrasting stories, it indicates new ways for improving novice teachers' learning and identity construction, and how their schools and the educational system as a whole can better support them at the entrance to the profession.

Symposium

Teaching and Teacher Education

Teacher Self-Efficacy: Difference, impact, and correlates

Keywords: Comparative studies, Educational Psychology, Mathematics, Mixed-method research, Motivation, Pre-service teacher education, Quantitative methods, Self-efficacy, Teacher Effectiveness, Teaching approaches

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Lisa F. Smith, University of Otago, New Zealand

Discussant: Jeffrey Smith, University of Otago, New Zealand

Teacher self-efficacy beliefs concern teachers' capacity to carry out their professional roles successfully. These beliefs are of interest to educational researchers, as they have been shown to relate to significant outcomes for students, schools, and teachers themselves (Tschannen-Moran, Hoy, & Hoy, 1998). Over the past forty years, interest in teachers' self-efficacy

beliefs and their impact has spread from studies conducted by the Rand Foundation in the USA (Armor et al., 1976) to a wide variety of global contexts, as evident here. Indeed, this symposium brings together studies of both preservice and serving teachers from Norway, England, and New Zealand to consider how teacher self-efficacy beliefs may differ among nations, schools, and individuals, and how these beliefs relate to positive and negative outcomes. The first paper presents a study exploring how the pedagogical practices in mathematics of 327 New Zealand primary and middle school teachers differ according to their level of teacher self-efficacy belief. Next, using a sample of 523 Norwegian teachers, the relationship between teacher self-efficacy and job demands, resources, emotional exhaustion, and engagement in teaching are discussed. The third presentation takes a very different methodological tack, using a mixed methods approach to understand how teacher self-efficacy beliefs are shaped by mastery experiences in schools in England. The final presentation involves a comparative study of the teacher self-efficacy beliefs of preservice teachers in Norway and New Zealand.

The impact of mathematics teaching efficacy on teachers' pedagogical practices

Presenting Author:Naomi Ingram, University of Otago, New Zealand; **Co-Author:**Mustafa Asil, University of Otago, New Zealand; **Co-Author:**David Berg, University of Otago, New Zealand

This study explores the pedagogical practices of 167 Year 4 and 160 Year 8 New Zealand mathematics teachers who have different levels of mathematics teaching efficacy. Using data from the National Monitoring Study of Student Achievement 2013, the teacher questionnaire items believed to be the indicators of mathematics teaching efficacy were selected, represented by six items such as "I feel confident about teaching maths". Then, low, mid, and high efficacious teachers were identified and compared to see how they differed with respect to their teaching profile and the frequency they used effective pedagogies when teaching mathematics (italicised below) (Anthony & Walshaw, 2007). Twenty eight percent of Year 4 and 41% of Year 8 teachers had high mathematics teaching efficacy. Compared with the other teachers, teachers with high mathematics teaching efficacy were better able to provide an *ethic of care* in their classroom, they more frequently *arranged their classrooms for learning* to enable students to collaborate, and more frequently expected their students to *communicate* their thinking and debate ideas with others. They more frequently provided students with *worthwhile mathematical tasks*, they more frequently provided opportunities for their students to *build on their own thinking* and to explore how new learning linked to or changed what they already knew. They more frequently expected their students to make *mathematical connections* by reflecting on their learning, to use multiple representations, and use ideas and skills from different curriculum areas.

Job demands and job resources in the teaching profession: Relations with teacher self-efficacy

Presenting Author:Einar Skaalvik, Norwegian Univ. of Science and Technology, Norway; **Co-Author:**Sidsel Skaalvik, Norwegian Univ. of Science and Technology, Norway

The purpose of this study was to explore how teacher self-efficacy was related to (a) job demands and job resources in the school environment, (b) emotional exhaustion and (c) teachers' engagement in teaching. The study was based on Social cognitive theory and the Job Demands – Resources model (JD–R model). The job demands measured in this study were (a) time pressure or work overload and (b) low student motivation. We included two measures of job resources in the study: one organizational resource (teacher autonomy) and one social resource (supportive social climate at school). Participants were 523 teachers in three counties in central Norway. We analyzed data by means of confirmatory factor analyses and SEM analysis for latent traits. The results showed that teacher self-efficacy was positively predicted by both job resources in the study whereas it was negatively related to lack of student motivation. However, in the SEM-model self-efficacy was not significantly predicted by either time pressure/work overload or by emotional exhaustion. Self-efficacy positively predicted engagement whereas emotional exhaustion predicted engagement negatively. The study clearly indicates that self-efficacy is influenced by both job demands and job resources in the school environment. However, it also indicates that it is not affected by all job demands. Possible interpretations will be discussed.

Enhancing Preservice Teachers' Efficacy Beliefs Through a School-University Partnership Programme

Presenting Author:Claire Lloyd, Liverpool Hope University, United Kingdom; **Co-Author:**Sue Cronin, Liverpool Hope University, United Kingdom; **Co-Author:**Michelle Pearson, Liverpool Hope University, United Kingdom

For over 30 years, teacher efficacy has been identified as a teacher characteristics relating to student achievement and motivation. Moreover, some of the most powerful influences on the development of teacher efficacy are mastery experiences during student teaching and the induction year, alongside vicarious experiences and social persuasion (Charalambous & Philippou, 2010). This paper reports the results of an investigation into student teachers' efficacy through participation in an intensive school-university partnership programme in the first year of their three-year BA. The programme provides students with mastery experiences through a cycle of Ambitious Teaching, (Smith, Lee & Newman, 2001; Lampert et al. ,2013) and builds upon a collaborative cycle of modelling and feedback. Data were collected from 30 students who participated in the partnership programme. Using The Teacher Sense of Efficacy Scale (Woolfolk-Hoy, nd), pre- and post-programme levels of self-efficacy were analysed quantitatively. Qualitative arts-based methods were also used to explore students' perceptions of schools in challenging circumstances. This complementary form of data collection allowed for further exploration of changes in beliefs (Liamputtong & Rumbold, 2008; Pink, 2006). Preliminary analysis of questionnaire data revealed pre-post shifts in students' self-efficacy. Qualitative data lent further support to the power of the programme in changing beliefs. Indeed, the qualitative analysis revealed a consistent pattern of improvement and nuancing

in students' perceptions of schools in challenging circumstances. The results suggest that carefully designed partnership programmes, which provide student teachers with guided mastery experiences in challenging school contexts, can lead to positive changes in self-efficacy.

Preservice teachers' self-efficacy and choice of teacher education in Norway and New Zealand

Presenting Author: David Berg, University of Otago, New Zealand; **Co-Author:** Einar Skaalvik, Norwegian Univ. of Science and Technology, Norway

In this presentation, we present preliminary findings from year-one of a five-year longitudinal study exploring the teacher self-efficacy beliefs and motivation to teach of preservice and beginning teachers in Norway and New Zealand (NZ). Here, the reported reasons for enlisting on an initial teacher education degree and the self-efficacy beliefs of Norwegian and NZ preservice teachers are compared. The primary purpose of the study is to compare the reasons for enlisting in a teacher preparation degree programme and the teacher self-efficacy beliefs of preservice teachers in two nations. A second purpose was to contrast the self-efficacy beliefs of these preservice teachers with findings from previous studies examining in-service teachers. Preservice teachers from Norway ($n = 292$) and NZ ($n = 50$)*, in the first weeks of their first year of their initial teacher education, completed the 24-item Norwegian Teacher's Self-Efficacy Scale (NTSES) and the 36-item Reasons for Choosing Teacher Education Scale (RCTES) in Norwegian and English respectively. We explore how these cohorts of students differ and consider possible explanations for such differences. Our main finding was that the NZ cohort in comparison to their Norwegian peers reported both higher motivation to teach and teacher self-efficacy beliefs. This may be accounted for by a response bias, cultural difference, and/ or contextual factors. A second finding is that the factor patterns of preservice teachers are less differentiated than found with experienced teachers.* NZ sample size to be expanded prior to presentation.

Symposium

Cognitive Science

Executive functions as precursors of mathematical skills

Keywords: Cognitive development, Cognitive skills, Early childhood education, Educational Psychology, Mathematics, Primary education

Interest group: SIG 15 - Special Educational Needs

Chairperson: Piia Björn, University of Eastern Finland, Finland

Discussant: Annemie Desoete, Belgium

Executive functions (EF) refer to higher order cognitive abilities used in planning, information processing, and problem solving, and they contribute significantly to children's math performance (Clements, et al. 2016). They include at least three main processes: 1) attention shifting and cognitive flexibility, 2) inhibitory control, and 3) working memory (WM). This symposium aims to investigate the relationship between EF and mathematical performance by using cross-sectional, and longitudinal data from four different countries (Singapore, South Africa, The Netherlands, and Finland). The first paper (Ragpot et al.) concentrates on how children's EFs relate to their numerical skills and listening comprehension at the beginning of formal schooling. The second paper (Kroesbergen et al.) explores how number sense, EFs and mathematics are related during first years of primary education, and whether the relation between EFs and mathematics is mediated by number sense. The third paper (Lee et al.) explores whether four-year-old children's WM capacity mediates the effects of SES on children's math gains. The fourth paper (Kytälä et al.) shows how WM skills measured before school start predict later mathematical performance at 2nd grade. We expect the studies presented here to strengthen our knowledge on the interrelationship between EF and mathematics skills. Also, we expect the presentations to give new insights for approaches in learning via the findings of the studies presented. Finally, the symposium is completed by discussing the implications of the studies onto cumulative information on EF but also suggesting direction to future research.

SES related differences in gains in early math achievement are mediated by working memory

Presenting Author: Kerry Lee, National Institute of Education, Singapore; **Co-Author:** David Munez, National Institute of Education / Nanyang Technological University, Singapore; **Co-Author:** Rebecca Bull, National Institute of Education/Nanyang Technological University, Singapore, Singapore

Socioeconomic status (SES) is an important predictor of academic achievement and working memory capacity. In particular, SES has been found to predict children's math achievement at school entry, and in early elementary school. Research aimed at understanding relationship between SES, working memory, and early academic achievement has found that the effect of SES on children's academic achievement throughout childhood (6-15 year olds) may be mediated by executive functioning. The present study explores whether four-year-old children's working memory capacity mediates the effects of SES on children's gains in math achievement scores ($N = 866$). Results are consistent with a mediation effect and points to early differentiation in working memory. These findings suggest that early intervention programs, aimed at improving child's working memory capacity, may be necessary to mitigate the SES related achievement gap.

Working memory resources in children - stability and relation to subsequent mathematical skills

Presenting Author:Minna Kyttälä, University of Turku, Finland; **Co-Author:**Piia Björn, University of Eastern Finland, Finland; **Co-Author:**Kaisa Kanerva, University of Helsinki, Finland

In this study, we aimed to investigate the stability of Working Memory (henceforth WM) skills from kindergarten to second grade, and the extent to which WM skills measured at kindergarten predict counting skills, basic arithmetic skills and math word problem solving skills at second grade. WM is part of executive functions (EF) which are suggested to incorporate all high-level brain processes including attention and inhibition. At the time of the first measurement point, the participants were 62 Finnish six to seven year-old kindergarten children. The second measurement point (P₂) took place approximately

2 years after the first measurement point when the children were eight to nine year-old and at 2nd grade. The results showed that WM capacity significantly increased over the 2-year period suggesting that the WM capacity does develop during early school age. However, individual skill profiles seemed to show stability, as sixty-two percent of the participants were ranked in the same skill group in WM skills at both time points. Verbal WM (VWM) and visuospatial WM (VSWM) resources seem to develop quite independently VWM skills showing more stability at this age phase than VSWM skills.

Math word problem skills at 2nd grade were predicted by prior VWM skills but not by prior VSWM skills. Basic arithmetic skills at 2nd grade were not predicted by prior WM skills.

The relation between executiver functions, number sense and mathematics throughout primary education

Presenting Author:Evelyn Kroesbergen, Utrecht University, Netherlands; **Co-Author:**Ilona Friso-Van den Bos, Utrecht University, Netherlands; **Co-Author:**Eveline Schoevers, Utrecht University, Netherlands

In this study, it was investigated how number sense, executive functions and mathematics are related in grades 1-4 of primary education, and whether the relation between executive functions and mathematics is mediated by number sense. 467 children were assessed on working memory, inhibition, mathematics (basic facts & problem solving), and three different number sense tasks. Working memory showed the strongest associations with mathematics, with no differences between the basis facts tests and the problem solving test. Both working memory and inhibition were found to be related to number sense. Furthermore, it was found that both working memory and number sense are most important during second year of mathematics education, and that number sense partially mediates the relation between working memory and mathematics. This study indicates that number sense is still developing during the first years of primary education and that it is necessary to foster children's number sense during this period, especially for low mathematics achievers and for children with working memory difficulties.

First grade children's competence in executive functions, numeracy and listening comprehension

Presenting Author:Minna Törmänen, University of Helsinki, Finland; **Presenting Author:**Pirjo Aunio, University of Oslo / University of Helsinki, Finland; **Co-Author:**Lara Ragpot, University of Johannesburg, Unknown; **Co-Author:**Riikka Mononen, University of Oslo, Norway; **Co-Author:**Johan Korhonen, Åbo Akademi University in Vaasa, Finland; **Co-Author:**Elizabeth Henning, University of Johannesburg, South Africa

Early numeracy competenc is crucial for children's mathematics learning beyond the early grades. South African children's performance in maths is of particular concern and early recognition of the possible causes for low performance are investigated in a number of research projects in the Centre for Education Practice Research at the University of Johannesburg's Soweto campus. This paper reports on one of these studies, in which first graders (n=238) in Gauteng Province were assessed by way of three instruments: The cross sectional data captured the relation of their (i) early numerical competency on a maths measurement developed by Aunio and Mononen (2014), (ii) their EF on a Flanker task test (Roebers & Kauer, 2009) and (iii) their listening comprehension skills on a test (Ragpot & Brink, 2016), which was adapted from Snow (1998). The results show that there is a positive relation between the children's early mathematics/numeracy competence, their listening comprehension and their EF.

Symposium

Learning and Social Interaction

„Work agency“ - a promising concept for facing culturally challenging affordances

Keywords: Collaborative Learning, Competencies, Content analysis, Ethnography, Higher education, Knowledge creation, Multicultural education, Qualitative methods, Quantitative methods, Self-regulation, Social interaction, Vocational education, Workplace learning

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Frank Achtenhagen, University of Göttingen, Germany

Discussant: Doreen Holtsch, University of Zurich, Switzerland

Discussant: Fritz Oser, University of Fribourg, Switzerland

Today's economic, technological, and societal challenges – including the busy migration processes impose strong demands on labor market participants across all hierarchical levels, cultures and European countries. Hence, employees and migrants are required to develop their professional competencies and practices, across traditional professional boundaries, negotiate their career, re-construct professional relationships and transform their cultural and professional identity. Within this symposium we are introducing the concept of „work agency“ and explore it with regard to its potential for coping with culturally challenging affordances. The first paper „Human agency at work: A conceptual Introduction“ works out theoretical discourses on human agency in relation to work-related learning and development as well as work-related behavior in general. By the second paper „Migrants' career decisions and agentic adaptability“ career decisions and adaptability of migrants and refugees across Germany are investigated. The third paper „Fostering professional learning and agency – An identity coaching programme“ focuses on a successful identity coaching programme implemented with professionals from universities and hospitals. The fourth paper „Institutional social dynamics and the absence of collective agency in academic work“ reports on a self-ethnographic approach to critically analyze the relationship between social structure, culture(s) and distinct forms of agency within academic settings. By the contributions we shed light into these processes of building intercultural relationships, adaptability within career decisions and suggest programs but also context factors for arranging successful learning arenas for promoting „work agency“.

Human agency at work: A conceptual introduction

Presenting Author:Michael Goller, University of Paderborn, Germany

The concept of human agency describes that human beings are agents of influence and power that are able to cause things and to bring about change. In this sense, notions of human agency are usually explicitly or implicitly associated with ideas that individuals make choices, take initiatives, and act proactively to exert control over their lives and their respective environments. This presentation gives a brief overview about theoretical discourses on human agency in relation to work-related learning and development as well as work-related behaviour in general. A special focus will hereby be laid on the development of a theoretical framework that integrates different perspectives about human agency discussed in the literature. In addition, this presentation aims at discussing how the concept of work agency can be used to explain how individuals and organisations can cope with current societal and economic challenges like mass migration, digitalisation of work or demographic changes.

Migrants' career decisions and agentic adaptability

Presenting Author:Susanne Weber, Ludwig-Maximilians-Universität (LMU), Germany; **Co-Author:**Josef Guggemos, Ludwig-Maximilians-Universität (LMU), Germany

Current migration challenges all participants at the labor market. In July 2016 more than 600.000 people migrate into the EU (Eurostat: 30.09.2016). Most people coming from Syria, Irak and Afghanistan have an age of 16 to 26 years. Just 10% had no formal education (BAMF, 2016). As the German labor market seeks for middle- and high-skilled non-academics there is hope to fill the given demographic gap by migrants. Critical considerations arise whether the migrants step in or whether they have other career aspirations (Solga, 2016). Within this study we asked (N=150) migrants in an ad hoc sample about their career decisions and adaptability behavior (Ratschinski, 2014) to the labor market – to get insight into their professional identities, knowledge and competences as well as their strategies and future goals as resources for the enactment of life course agency (Eteläpelto et al., 2013). Running qualitative and quantitative analyses (like rubrics, (non-)parametric tests) the results show that the migrants have clear career goals for prestigious occupations and a strong professional identity. Migrants with an option to stay have a significantly higher motivation to adapt to given and non-foreseeable new workplaces. But most of them are lacking for additional information on options. The results give fruitful hints for creating supportive means for these groups with few individual resources to get engaged in continuous professional learning demands for developing their individual well-being, satisfaction but also organizational performance and commitment at work (Vähäsantanen 2016) and for formulating new research questions and expectations in labor market policy.

Fostering professional learning and agency – An identity coaching programme

Presenting Author:Susanna Paloniemi, University of Jyväskylä, Finland; **Co-Author:**Katja Vähäsantanen, University of Jyväskylä, Finland; **Co-Author:**Päivi Hökkä, University of Jyväskylä, Finland; **Co-Author:**Anneli Eteläpelto, University of Jyväskylä, Finland

This study addresses the professional learning that occurred in an identity coaching programme. The arts-based programme aimed to enhance the participants' professional learning, notably through helping them to process their professional identities. Professional learning was seen as resourced by the participants' professional agency, and by the promotion of such agency. Via interviews, we investigated what the participants perceived they had learnt during the programme, and the potential differences in learning outcomes between professional groups from university and hospital contexts. The findings showed that the programme was perceived as a rich learning arena in the domains of the professional self (involving a crafted professional identity), professional relationships (involving increased knowledge of colleagues and becoming an active participant in the work community), and professional competencies (involving socioemotional knowledge and skills). The professionals (academics and administrative personnel) from a university learnt

more during the programme than did the nurses and physicians working in a hospital. The findings suggest that the primary emphasis in professional learning should be on professional identity and agency within the social relationships that exist in training and work settings. The study also presents the theoretical considerations regarding the connection between professional agency and learning.

Institutional social dynamics and the absence of collective agency in academic work

Presenting Author: Frank Achtenhagen, University of Göttingen, Germany; **Co-Author:** David M. Hoffman, University of Jyväskylä, Finland

Self-ethnography offers a useful approach in the critical analysis of the relationship between social structure, culture(s) and distinct forms of agency within academic settings where personnel are unaware of key obstacles to the emergent collective agency inherent in continuous renewal and innovative development. The paper illuminates hidden institutional dynamics, social practices, and career trajectories which spotlight obstacles and constraints for the productive renewal of research traditions, including HR practices, modes of inquiry, methodology, methods and substantive focus within a research institute. It is shown how institutional practices and traditions reproduce global inequities, rather than the societal transformation Finland's education system was historically noted for. Concretely, the analysis explains emergent patterns of structural scholarly precariousness and their relationship to the lack of work agency manifested both at the individual and collective levels which prevents the institutional renewal of organisations and individual career trajectories. Hoffman et al. (2016) identify three transnational strata that explain the global division of scholarly labor, which in turn highlight distinct institutional dynamics that explain the structural characteristics in which agency plays out, as well as the most important types of culture(s) relevant within each stratum.

Session H 25

31 August 2017 10:15 - 11:45

Main Building E - E222

Invited Symposium

Teaching and Teacher Education

Why should teachers engage in research? - examples from Learning study and Lesson study

Keywords: Action research, Phenomenography, Teacher Professional Development, Teaching / instruction

Interest group: SIG 09 - Phenomenography and Variation Theory

Chairperson: Peter Davies, University of Birmingham, United Kingdom

Organiser: Angelika Kullberg, University of Gothenburg, Sweden

Discussant: Kirsti Klette, University of Oslo, Norway

The theme of the EARLI 2017 conference emphasizes "the role of research in the advancement of public good". In this symposium we address this theme by focusing on research on the development of teaching in order to promote enhanced student learning in schools. In the symposium the question why teachers should engage in research is discussed by means of examples from practitioner research conducted through lesson study or learning study. The aim of this symposium is to discuss what practitioner research based on lesson studies and learning studies can contribute with, e.g., in terms of practice based knowledge production to be shared with others.

Learning study, Chinese lesson study and the keys of learning

Presenting Author: Ming Fai Pang, The University of Hong Kong, Hong Kong; **Co-Author:** Ference Marton, Göteborg University, Sweden

Our paper has two purposes. First, we want to advance the thesis that lesson study should be considered the signature pedagogy of teachers. Shulman (2005) pointed out that different professions have different and unique ways in which novices acquire professional knowledge and attitudes, i.e. the "signature pedagogies". The three versions of Lesson study mentioned i.e. Japanese lesson study, Learning study and Chinese lesson study, all have the idea of the lesson and its different aspects in common. Several teachers specializing on a subject and on a level within the subject plan, discuss, analyze, evaluate a lesson, observe one of them interacting with students, as well as students interacting with each other. It is deemed a reasonable signature pedagogy for the teaching profession. Second, we argue that teachers should be involved in research. The above three versions of Lesson study have in common that pedagogical knowledge is sought: How can we contribute to better learning in the sense of making it possible to discern aspects of the object of learning that are necessary for students to discern. Such aspects are critical for learning (a particular object of learning); they are the "keys of learning". If this is the case, we would need to develop pedagogical theories of how we can contribute to making it possible for students to discern those critical aspects. If we want to put pedagogical theories to test, teachers have to mediate the theories and make them his/her own. And doing so amounts to doing research.

Can public knowledge be created through practitioner research?

Presenting Author: Anna Vikström, Luleå university of technology, Sweden; **Co-Author:** Angelika Kullberg, University of Gothenburg, Sweden; **Co-Author:** Ulla Runesson, University of Jonköping, Sweden

The purpose of this paper is to discuss the character of practitioner research in schools and the question asked is: *Can a specific form of teachers' research produce practice-based knowledge relevant beyond the borders of the local school*

context? The possibilities for this have been questioned by for example Enthoven & de Bruijn (2010) who in an extensive literature review focus the question of which mechanisms can be identified as enabling practice based knowledge production. They found that objectives and intended products are rarely clearly defined and operationalized in practitioner research conducted within professional communities. Instead, teachers' collaboration seemed to be aiming at practical innovations and change through teacher learning, and not through evaluation of the innovations, and that the practitioner's networks were not used to create public practical knowledge beyond the borders of the local school. On the other hand, Morris & Hiebert (2011) have, by studying the quality movement in health care science and lesson studies in Japanese schools, found three characterizing features that enabled the construction of knowledge products in practitioner research: 1. Shared problems across the system, problems that the products help to solve. 2. Small tests of small changes, with research methods that are associated with testing and revising the products, methods often ignored or dismissed in descriptions of scientific approaches. 3. Jointly created products where the knowledge used to build the products is harvested from participants with different kinds of knowledge and competence.

The Contributions of Learning study to teacher engagement in research in an Asian setting

Presenting Author:Wai Ming Cheung, The University of Hong Kong, Hong Kong; **Co-Author:**Stephanie Wing Yan Chan, The University of Hong Kong, Hong Kong; **Co-Author:**Kevin Ka-Hin Tsang, The University of Hong Kong, Hong Kong

Globalization leads to the increasing number of minority language learners (MLL) in Hong Kong classrooms with different languages and different language proficiencies who face great obstacles in learning Chinese. Their teachers also lack the capability to teach Chinese as a second language. Effective professional development for primary school teachers who strive to provide MLL with high-quality Chinese literacy instruction is clearly needed. A 2-layered Professional Development Model, inspired by the Variation Theory and Learning Study, has been developed to equip 69 teachers the capability of teaching Chinese as a second language in 18 primary schools. The aim of this study was to explore the characteristics of this 2-layered professional development model for teachers that contributes to teacher engagement in classroom-based research in helping MLLs learn Chinese. The effectiveness of this model in terms of teachers' culturally responsive teaching self-efficacy and the interview which has been found related to student outcomes and teaching behavior will be reported. The practical relevance and the interactions between these 2 layers of the model will also be discussed. This model shed light on a powerful model of the professional development.

Sustaining School and Teacher Development through Lesson-based Teaching Research Practice

Presenting Author:Yanping Fang, National Institute of Education / Nanyang Technological University, Singapore

Teachers engaging in practitioner research most often to improve practice and student learning while researchers to improve practice by building more knowledge, understanding and form theories to make sense of practice and its nature and meaning. In the age of reform demanding drastic change in classroom teaching, teachers are also engaged in research to more effectively implement curriculum with better understanding to inform their teaching and student learning as well as their own professional learning. This unified process of teacher learning from doing reform has been what teachers in Shanghai engaged in since 2001, the Second-phase of National (Municipal) Curriculum Reform that called for inquiry-based and student-oriented teaching. This paper, through case study of five schools Shanghai based on school principals master's thesis work at National Institute of Education, will focus on how Shanghai schools have developed new school-based teaching research practice in the form of lesson case research (keli yanjiu) that expected schools to capitalize on the traditional public lessons (similar to lesson study) in schools to engage teachers in studying and implementing the new curriculum and reflecting on their experience through repeated planning, observing and improving their classroom lessons and writing lesson cases. How the process is framed and conducted as problem-based and project-led practices across different types and levels of schools in Shanghai provides both intriguing and meaningful cases to uncover the social-cultural mediations of this technology of practice and to help make sense of its seamless integration into the school routines and teachers' work.

Session H 26

31 August 2017 10:15 - 11:45

Pinni A - Paavo Koli

Invited Symposium

Defining, measuring, and supporting central concepts in inquiry learning

Keywords: Inquiry learning, Knowledge creation, Learning approaches, Problem-based learning, Reasoning

Interest group: SIG 20 - Inquiry Learning

Chairperson: Bram De Wever, Ghent University, Belgium

Organiser: Bram De Wever, Ghent University, Belgium

Organiser: Wouter R. van Joolingen, Utrecht University, Netherlands

Organiser: Annelies Raes, Ghent University, Belgium

Discussant: Wouter R. van Joolingen, Utrecht University, Netherlands

Traditionally, inquiry learning has been based on the processes that make up the inquiry cycle, including hypothesizing, experimenting, analyzing and concluding. However, to meet the needs of the 21st Century, the way inquiry learning is conceptualized should be placed under renewed scrutiny. This is a consequence of developments in technology in society.

Technology allows for new ways of interacting with learning environments, such as through robots and tangible interfaces and also allow for new kinds of monitoring students' learning activities based on large data sets. Also, in our dynamic society students need to critically collect, assess and act upon (scientific) information. This emphasizes the need for inquiry learning as a means to acquire those skills. This symposium brings together researchers working on the challenges of (re)defining, measuring and supporting central concepts in inquiry learning in different settings. The paper by Gomoll and colleagues aims to reconceptualize the concept of *engagement* in collaborative inquiry investigating the role of nonverbal engagement in the process of joint problem solving from a qualitative approach. Lazonder & Janssen deal with the challenge of measuring young children's scientific reasoning proficiency. Finally, De Grez et al. and Montrieux et al. both focus on the third challenge, namely how to design effective inquiry learning environments and the necessary scaffolds.

Reconceptualizing Engagement: How Embodied Interaction Can Support Collaborative Inquiry

Presenting Author:Andrea Gomoll, Indiana University, United States; **Co-Author:**Cindy Hmelo-Silver, Indiana University, United States; **Co-Author:**Erin Tolar, Indiana University, United States; **Co-Author:**Selma Šabanović, Indiana University, United States

As students engage in the complex work of collaborative inquiry, they construct shared meaning using resources available to them. In the research to be presented, we examine how this occurs for middle school students engaged in a human-centered robotics (HCR) experience. The robots that students design, build, and program in this inquiry-based curriculum are used to serve a need in their school and to connect with peers in remote contexts—using telepresence technology to make connections and spark curiosities across urban and rural classrooms in the US. Exploring what might pose challenges and provide support for the construction of shared meaning informs the design of learning environments and activities that can help learners to see themselves as capable STEM learners and practitioners. In past research, behavioral engagement and social engagement have been privileged as evidence of students' collaborative inquiry and learning. This study aims to reconceptualize engagement in collaborative inquiry—investigating the role of nonverbal engagement in joint problem solving for one small group. This work is a qualitative case study centered on the collaboration of four students in a human-centered robotics intervention. Tenets of discursive psychology are used to consider how this group's nuanced discourse shaped their collaborative inquiry. We explore how discursive features including gaze, embodied gesture, the positioning of artifacts, and interaction with technology contributed to the problem solving process. This analysis draws implications for the design of future iterations of inquiry-based curricula.

How do students deal with 2 different scripts for a collaborative inquiry scientific reasoning task

Presenting Author:Nore De Grez, Ghent University, Belgium; **Co-Author:**Joni Lämsä, University of Jyväskylä, Finland; **Co-Author:**Raija Hamalainen, University of Jyväskylä, Finland; **Co-Author:**Ingo Kollar, University of Augsburg, Germany; **Co-Author:**Bram De Wever, Ghent University, Belgium

This study illustrates the effects of two different scripting approaches (Vogel, Wecker, Kollar & Fischer, 2016) to scaffold students' scientific reasoning abilities while being engaged in collaborative writing activities on their learning processes and outcomes within Web 2.0 environments in higher education. Three similar studies were set up for university students (N=88) in Germany (n=27), Belgium (n=43), and Finland (n=18). Although the content of the course differed, the scripted task was the same in all settings, namely writing a recommendation paper on a specific subject. Students collaborated in small groups of three to four via Web 2.0 technology, i.e. in a shared Google Document. In each course, groups were divided randomly over two scripted conditions: (a) phase-script: a script that segmented collaboration in different phases (based on a script used by De Wever et al. 2015) and (b) phase-plus-activities script: an extended script that also provided learners with guidance on the specific activities to engage during each phase. As dependent variables we measured students' scientific reasoning (SR) ability with a performance and declarative test, their subjective knowledge acquisition (both with respect to content and SR ability) and their acceptance of the scripts. This presentation however focuses only on the latter. By qualitatively analyzing students' reflection notes, we investigate how students perceived the scripts and whether and how students made use of the script. This is important in view of later analyses focusing on the differential impact of the script on students' learning outcomes.

Performance-based assessment of scientific reasoning in children

Presenting Author:Ard Lazonder, Radboud University, Netherlands; **Co-Author:**Noortje Janssen, University of Twente, Netherlands

Recent longitudinal and cross-sectional studies have examined how scientific reasoning skills such as experimenting, making inferences and evaluating evidence develop in young science learners. Results, although informative, likely underestimate children's true capabilities because data in these studies was collected by written tests. To circumvent this possible threat to predictive validity, a three-year project was launched to monitor children's performance on practical inquiry tasks through time. Using a longitudinal design, 170 elementary schoolchildren aged 7-10 participate in three annual waves of data collection. Specifically, they undertake an investigation with physical materials under guidance of a test administrator, who captures their scientific reasoning processes by observing and eliciting explanations. Results of the first year demonstrate good psychometric qualities of this new performance-based assessment instrument, and a consistent linear increase in scientific reasoning proficiency across age categories that was largely independent of children's language and math abilities. Analyses at the level of individual skills revealed that scientific reasoning develops asynchronously in children. The skills of experimenting and inferencing were already performed quite well, 'predicting' was more difficult, and

'evaluating data' and 'drawing conclusions' were the least well-developed skills. The second wave of data collection takes place in February and March 2017; results will be analyzed within-subject to find out to what extent children have improved in scientific reasoning and whether the five scientific reasoning skills develop at the same pace in same-aged children.

How technology can support teacher and students to differentiate during web-based inquiry learning

Presenting Author:Hannelore Montrieux, Ghent University, Belgium; **Co-Author:**Annelies Raes, Ghent University, Belgium; **Co-Author:**Elise Ameloot, Ghent University, Belgium; **Co-Author:**Tammy Schellens, Ghent University, Belgium

Organizing differentiated instruction has always been a challenge. However, technology has opportunities to provide students with adaptive content tailored to their needs. Next to this, technology does not only support student learning, but technology has also the opportunity to provide real-time visualization of student activities with the aim of supporting instructors' orchestration. This study investigated the impact of four differentiated instruction conditions on science learning through a web-based collaborative inquiry project called 'High'. The project aimed to improve conceptual knowledge about the effect of drugs, as well as inquiry skills. Three experimental conditions (1. differentiation through adaptive content, 2. differentiation through teacher support based on the progress monitor, and 3. both types of differentiation combined) were compared with a control condition in a two-by-two factorial quasi-experimental design. The content-based differentiation was based on the theoretical framework of Tomlinson. In a four-week field study in secondary science education that involved 309 students from 20 secondary school classes, pretest-posttest differences were measured. Findings reveal that students in all conditions make significant improvement in terms of conceptual knowledge and inquiry skills. However, analyses of covariance show that the conditions differ significantly on conceptual knowledge. Students from the condition provided with both types of differentiation outperform students from the conditions only provided with one mode of differentiation. These conditions however showed better results compared to the control condition. Next to the presentation of the main findings, we will discuss both the challenges of differentiated inquiry instruction and the opportunities of technology in this context.

Teachers' epistemic thinking: Investigating effects of knowledge domains and educational fields

Keywords: Educational Psychology, Reasoning, Secondary education, Teaching / instruction

Presenting Author:Tessa van Schijndel, Leiden University, Netherlands; **Co-Author:**Nadira Saab, Leiden University, Netherlands; **Co-Author:**Amanda Berry, RMIT University, Australia; **Co-Author:**Jan van Driel, The University of Melbourne, Australia

Recent developments in the field of education, such as the focus on inquiry-based approaches (European Commission, 2007) and 21st Century Skills (Voogt & Pareja Roblin, 2010), ask for advanced levels of student epistemological understanding. However, in order for teachers to improve students' levels of epistemic thinking, they need to show advanced levels themselves. Kuhn & Weinstock (2002, in Kuhn, Iordanou, Pease & Wirkala, 2008) defined the development of epistemic thinking in terms of the coordination between objective and subjective dimensions of knowing. Kuhn et al. (2008) investigated teachers' epistemic thinking and besides finding evidence for a more general trajectory explaining development across domains, they also demonstrated a 'specificity of content and context' (Kuhn et al., 2008, p.447). Therefore, the present study aimed at investigating secondary teachers' epistemic thinking, taking into account different knowledge domains in which epistemic thinking is assessed (history and biology), as well as including teachers from different educational fields (sciences, humanities, and languages). We used Barzilai and Weinstock's (2015) Epistemic Thinking Assessment (ETA), which was based on the theoretical perspective developed by Kuhn and colleagues. The ETA is a paper-and-pencil assessment, for which the reliability and validity have been investigated, and the measure allows for comparing epistemic thinking across knowledge domains (Barzilai & Weinstock, 2015). The study's results (are momentarily being analyzed, and) will bear relevance to the educational context by providing suggestions for teacher training in the area of epistemic thinking.

Development of Web-based Investigation System for Teachers' Judgements on Students' Performance

Keywords: Assessment methods and tools, Computer-assisted learning, Teacher Professional Development, Technology

Japan; **Co-Author:**Hidekazu Kaminishi, Dokkyo Medical University, Japan; **Co-Author:**Tatsushi Fukaya, Gunma University, Japan; **Co-Author:**Yuri Uesaka, University of Tokyo, Japan; **Co-Author:**Masanori Nakagawa, Otsuma Women's University, Japan

p.p1 {margin: 0.0px 0.0px 0.0px 0.0px; text-align: justify; font: 10.5px Times} span.s1 {font: 10.5px 'Times New Roman'}
p.p1 {margin: 0.0px 0.0px 0.0px 0.0px; text-align: justify; font: 10.5px Times} span.s1 {font: 10.5px 'Times New Roman'} To provide suitable instruction to their students, teachers have to predict their students' learning performance accurately. Uesaka and Nakagawa (2012) proposed a new mathematical model for analyzing "teachers' judgement", which indicates the accuracy of teachers' predictions of distribution of students' performance. Based on this model, we are developing Web-based Investigation System for Teachers' Judgements on Students' Performance, termed Wits. The final goal of this research is to offer an application that enables teachers to analyze teachers' judgement easily and provides information for improving their teaching methods. In this paper, we describe the features and preliminary analysis results of Wits.

How students in schools with personalized learning concepts solve mathematical problems

Keywords: Competencies, Problem solving, Student learning, Teaching / instruction

Presenting Author:Mirjam Schmid, University of Fribourg, Switzerland; **Co-Author:**Christine Pauli, University of Fribourg, Switzerland

This contribution presents research examining the problem-solving competencies of ninth grade students (N=250). This study is part of a longitudinal research project on schools with personalized learning concepts in Switzerland. These schools emphasize, among other things, the promotion of cross-curricular competencies. Problem-solving competencies represent a central skill in various academic and extracurricular learning and performance areas. This research analyses the extent to which cross-curricular competencies and problem-solving competencies in particular are acquired at schools with personalized learning concepts. The literature usually employs models that break problem-solving processes down into different stages. Though theoretically substantiated, the classic models are criticized for suggesting the different stages occur consecutively, when it has been empirically demonstrated that various stages of problem-solving processes do not always occur in a linear manner. The research presented in this contribution analyses students' problem-solving competencies, by distinguishing different stages in their problem-solving process and considering students' own account of the process. The students were asked to solve a mathematical problem and subsequently complete a questionnaire with both open and closed-ended questions on their approach to solving the problem, as well as problem solving in general. The students' results were scored according to a coding guide, and the open-ended questions regarding the problem-solving approach were evaluated by means of content. First results show that students' problem-solving performances as well as strategies are very diverse. Next steps consist in considering the quality of the problem-solving strategy, and identifying different student types based on common approaches to problem solving.

How can teachers promote children's effective learning strategy use while doing Kanji homework?

Keywords: Case studies, Cognitive skills, Out-of-school learning, Writing / Literacy

Presenting Author:Eriko Ota, University of Tokyo, Japan

Many children in Japan experience some difficulty in learning *Kanji*, which is one of the scripts used in the modern Japanese writing system. Japanese people are expected to learn at least 2,136 *Kanji* characters by the end of their school education. In this situation, teachers need to promote children's acquisition of skills for learning *Kanji* effectively and in a self-regulated way. Over the last few decades, many psychological research studies have shown the effectiveness of using cognitive (e.g., elaboration, organization) and metacognitive (e.g., monitoring, controlling) learning strategies, including where studying *Kanji* is concerned. However, the homework that most teachers assign students tend to be drill practice and effective learning strategies are not adequately taught in school. The present study introduces two educational practice cases intended to promote children's acquisition of cognitive and metacognitive skills while doing homework: provision of individual tutoring sessions for a 6th-grade child with LD, and provision of extracurricular lessons at an elementary school. In these two cases, children who had encountered problems in learning *Kanji* improved in their performance and motivation to spontaneously use effective learning strategies. The result of these cases implies that it is effective to teach learning strategies in a way that conforms to the context of children's daily learning at home. This finding may have useful implications in the field of teacher education (e.g., pedagogical content knowledge, lesson planning), as well as in school instructional practices.

Learning to diagnose – Aiming to support students in their learning process

Keywords: Assessment methods and tools, Mathematics, Teacher Professional Development, Video analysis

Presenting Author:Rita Hofmann, University of Koblenz-Landau, Germany; **Co-Author:**Jürgen Roth, University of Koblenz-Landau, Germany

The learning process of students is a complex aspect of lessons. To support this process it is important that the requirements of the tasks conform to the knowledge and skills of the students. Moreover, at this state, there is special need for the teacher who must have special skills to support the learners as good as possible. One essential skill is to see what the students' current level of learning is, which concepts and misconceptions they have, whether further instructions and help are needed – and if so, in what way. Such diagnostic competences, are essential for teacher actions. However pre-service teachers mostly do not have the opportunity to train these skills at university. Thus, there is a need to find out how to promote diagnostic competences in teacher training. In recent years, several projects have started to use videos to train

diagnostic skills, but there is still the question if pre-service teachers really acquire diagnostic skills better by analysing videos than by analysing tasks. This study aims to contribute to this growing area of research by exploring which one of these two methods promotes diagnostic skills better. An intervention study with a pre-post-test design shall give the answer to this question. Thereby the thematic focus lies on students' abilities, problems and misconceptions with graphs of functions (line graphs), which are essential for the understanding of and participating in economy, politics and media.

How school context and other factors relate to teachers' attitudes toward teaching integrated STEM.

Keywords: Attitudes and beliefs, Secondary education, Survey Research, Teaching / instruction

Presenting Author:Lieve Thibaut, KU Leuven, Belgium; **Co-Author:**Heidi Knipprath, KU LEUVEN, Belgium; **Co-Author:**Wim Dehaene, KU LEUVEN, Belgium; **Co-Author:**Fien Depaepe, KU Leuven, Belgium

Integrated STEM (Science, Technology, Engineering and Mathematics) education is an emerging approach to improve students' achievement and interest in STEM disciplines. However, the implementation of integrated STEM education depends strongly on teachers' competence, which entails, among others, teachers' attitudes. Nonetheless, not much is known about the factors that influence teachers' attitudes toward teaching integrated STEM. Therefore this paper uses a survey method to get insight in the influence of three groups of variables on the attitudes toward teaching integrated STEM: teacher background characteristics, personal attitudes and school context variables. The results of the multiple regression analyses reveal five variables that exert a positive influence on teachers' attitudes: non-teaching work experience, professional development, personal relevance of science, personal relevance of technology, and social context. Moreover, two variables show a negative effect: more than 20 years of teaching experience and experience in mathematics. These results are valuable since they can be deployed by school administrators to guide them when composing and supporting a team of teachers to implement integrated STEM education.

Session I 2

31 August 2017 12:00 - 13:30

Main Building E - E350

Poster Presentation

Motivational, Social and Affective Processes

PO: Motivation and Emotion

Keywords: Achievement, At-risk students, Computer-supported collaborative learning, Cooperative / collaborative learning, Emotion and affect, Goal orientation, Higher education, Mathematics, Mixed-method research, Motivation, Motivation and emotion, Peer interaction, Primary education, Science education, Self-regulation, Vocational education

Interest group: SIG 08 - Motivation and Emotion

Chairperson: Monika Waldis, University of Applied Sciences Northwestern Switzerland, Switzerland

Development and validation of an emotion regulation strategies self-reported instrument

Keywords: Emotion and affect, Mathematics, Primary education, Self-regulation

Presenting Author:Vanessa Hanin, Université catholique de Louvain (UCL), Belgium; **Co-Author:**Van Nieuwenhoven Catherine, Université catholique de Louvain (UCL), Belgium

Although emotions constitute a more recent object of research, they are known, like cognitive and motivational dimensions, as a major component of learning and academic performance. Insomuch as emotions are regarded as a major component of the learning process in the same way as cognitive and motivational dimensions, it becomes necessary to be able to regulate them. In this respect, we investigated the strategies mostly used by fifth and sixth graders to regulate negative emotions when resolving mathematical problems. Among the various classifications of emotion regulation strategies proposed in the literature, we retained that of Mikolajczak (2009). Given the lack of an instrument grasping the particular set of strategies used by students, we designed a self-reported instrument: Childrens' Emotion Regulation Strategies in Mathematics (CERS-M). There were 1380 5th and 6th graders from 23 Belgian schools who took part in this study. The validation of the CERS-M consisted of three steps. First, the exploratory factor analysis showcases six strategies explaining 42% of the total variance, i.e., emotional expression, help seeking, task focusing, short relaxation, emotional interiorization and dysfunctional avoidance. Let us note that the internal consistency of the scales was satisfying. Second, the fit indices resulting from the confirmatory factor analysis carried out, indicate that the model fits well with the data. Thirdly, the assessment of the validity and reliability of the questionnaire was good.

Is it all about the goal? Findings on cardiac reactivity in a laboratory mental arithmetic task.

Keywords: Achievement, Goal orientation, Motivation, Motivation and emotion

Presenting Author:Sigrid Wimmer, University of Graz, Austria; **Co-Author:**Helmut Lackner, Medical University of Graz, Austria; **Co-Author:**Silke Luttenberger, University of Teacher Education Styria, Austria; **Co-Author:**Ilona Papousek, University of Graz, Austria; **Co-Author:**Manuela Paechter, University of Graz, Austria

Students' academic goal orientations are important for their motivational approaches towards learning and education. Moreover, goal orientations are related to coping behavior and adjustment to environmental demands. The study investigated the role of different types of goal orientations concerning coping in achievement situations. Therefore, the relationship between goal orientations and cardiac reactivity, which indexes coping in the sense of investment of effort to

overcome a challenge, was examined. Overall 72 students participated in a laboratory achievement situation. They processed mental arithmetic tasks while their heart rate was recorded. Overall, performance was rather low with only $M = 12.5$ ($SD = 6.5$) out of 60 tasks answered correctly. Learning/Mastery Goals or Performance Goals did not reveal any significant relationships with cardiac reactivity; however, high scores on Work Avoidance Goal orientation were related to low reactivity. Hence, a high tendency to avoid work is related to rather low investment of resources. This result is expected to reflect high task difficulty, low interest in the task, and/or low personal importance of success. Although the dimension of Work Avoidance is often neglected in research, the present results underline that it might play a role concerning the goal orientations students apply. In addition, current results underline the importance of goal setting in the course of effort investment. Further research should investigate the concept of goal orientation in different situations which vary with regard to the consequences of one's behavior.

Giving and Taking?! Cooperation and Competition among University Students

Keywords: Cooperative / collaborative learning, Higher education, Peer interaction, Motivation and emotion

Presenting Author:Kerstin Helker, RWTH Aachen University, Germany; **Co-Author:**Carolin Schultz, RWTH Aachen University, Germany; **Co-Author:**Maike Harff, RWTH Aachen University, Germany; **Co-Author:**Karen Zschocke, RWTH Aachen University, Germany

While research has studied university students' appraisals of small group-work in higher education, this exploratory study aims to expand this view by focusing on students' general cooperation and competition during their studies. 92 undergraduate student teachers completed online questionnaires that included open-ended questions as well as adapted versions of the SAGA instrument, scales on general learning beliefs and resource management (MLSQ). Results showed that students' willingness to share their learning material and study information with co-students correlated with their viewing cooperation as generally beneficial. Regarding the aspects that were named as criteria for a good student, two clusters were identified which differed with regard to their own attitudes towards cooperating with others. Results suggest it worthwhile to focus on university students' general openness to cooperating with co-students and the implementation of structures for new students to build these cooperative networks.

Students' Affect and Group Work During Science Learning

Keywords: Computer-supported collaborative learning, Emotion and affect, Mixed-method research, Science education

Presenting Author:Tarja Pietarinen, University of Turku, Finland; **Co-Author:**Marja Vauras, University of Turku, Finland; **Co-Author:**Simone Volet, Murdoch University, Australia

This study examines affect and group work during a challenging science learning process, when students in upper secondary schools ($n = 120$) were working in small groups (39 groups of two to three peers for three sessions of 75-95 minutes) conducting a scientific experiment integrating biology and chemistry in a collaborative virtual science learning environment (Virtual Baltic Sea Explorer), and preparing a shared group presentation at the end. This group outcome was assessed by two science experts on the basis of hypotheses, research plan, conclusions and the quality of the use of scientific language. After each session, the students were asked to fill in a questionnaire, including self- and peer-assessments on the nature of their group work. Students' self-reports are combined with observed affective activity in six target groups of three students working together through the sessions and differing in the quality of their group outcome. Affective activity connects affect, social interaction and power relationships to examine group functioning in collaborative settings. The aim of the study is to show the different patterns of affect and group processes in collaborative virtual science learning and especially in relation to the quality of the productive outcomes. Students' self-reports are widening the understanding of affect and group processes by supplementing the individual differences within the groups. Preliminary observations are indicating, that affective activity varies in small groups showing different levels of affect, social interaction and power relations.

Emotions in Group Work Settings at University

Keywords: Emotion and affect, Mixed-method research, Motivation, Motivation and emotion

Presenting Author:Marold Wosnitza, RWTH Aachen University, Germany

The review of the existing body of literature reveals a broad range of theoretical frameworks on the affective and emotional experiences in group learning settings. It also shows a broad range of methodological approaches to research these experiences. In this paper results from a series of studies on emotions of university students will be presented and methodological implications and approaches discussed. The results presented are from two survey studies on emotions in group work learning settings ((a) Veterinarian and Teacher Education Students ($N=713$) and (b) 446 German Teacher Education students). Furthermore results from (c) an interview study with 35 college students and (d) emotion process data from 11 groups playing a serious game will be presented. Overall, the results showed different types of emotions, a broad range of relations between emotions and learning and motivation, ongoing changes over time related to the context and different types of students in regard to their emotional profiles. The results may provide educators with valuable information how to foster positive and to prevent harmful emotional patterns and, ultimately, may pave the way for enhancing educational practice in higher education. Furthermore the paper may indicate directions for future research from a methodological as well as theoretical perspective.

Students at risk for early academic drop-out

Keywords: At-risk students, Mathematics, Vocational education, Motivation and emotion

Presenting Author:Elke Baten, University of Ghent, Belgium; **Co-Author:**MarieClaire Vandeveld, Ghent University, Belgium; **Co-Author:**Edwin Hantson, Ghent University, Belgium; **Co-Author:**Brigitte De Craene, Ghent University, Belgium; **Co-Author:**Annemie Desoete, Ghent University & Artevelde University College, Belgium

The aim of this study is to investigate the characteristics of students at risk for academic drop-out in vocational education. Therefore, 54 pupils of 9th and 10th grade and 40 of their teachers participated in a large assessment program of the City of Ghent. Measurements of preferential transactional patterns, autonomous vs. controlled mathematical motivation, well-being and fact retrieval mathematics were conducted in the pupils. Intelligence was taken into account as a control factor. For the teachers, preferential transactional patterns were assessed. Results revealed that 58.14% of pupils were motivated by playful contact, whereas only 5% of teachers spontaneously focused on such a playful contact, demonstrating a mismatch. Further, only 10.91% of the pupils had the best qualitative motivation (high autonomous and low controlled motivation), according to the Self-Determination Theory. In addition, for pupils with focus on facts, better mathematical proficiency was found. Finally, the self-esteem among the pupils was low. All these findings might be related to the large rate of early academic drop-out in this particular school. Limitations and educational implications will be discussed.

Job Requirements and their Fulfilment during the first Years on Job: Findings from a Graduate Survey

Keywords: Competencies, Higher education, Survey Research, Lifelong learning

Presenting Author:Sonja Markwalder, University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

Competencies that students need to develop have become a central characteristic of higher education. It has consequently become an important issue of higher education research whether these competencies meet job requirements. Following this question, the aim of the present study was to evaluate whether graduates equipped with professional competence fit and fulfil their job requirements. The study was conducted with graduates of social work, who were invited one and three years after graduation to complete an online survey. The study was conducted with graduates of social work who were invited one and three years after graduation to complete an online survey. Results showed that job requirements differed between the different fields of social work, but that graduates did not differ in their rating of whether they fulfilled them. The poster presents the results of the analysis of the longitudinal data from the first and the second survey, one and three years after graduation. The focus lies on shifts in job requirements and changes in the ratings of whether graduates fulfil their job requirements. Therefore the poster offers insights in graduates' career paths during the first years on the labour market and points to the contribution of graduate surveys to higher education.

Developing student-led research: Customer, consumer, colleague, collaborator

Keywords: Case studies, Computer-assisted learning, Learning Technologies, Qualitative methods

Presenting Author:Elaine Tan, Newcastle University, United Kingdom; **Co-Author:**eleanor loughlin, Durham University, United Kingdom; **Co-Author:**Andrew Joyce-Gibbons, Durham University, United Kingdom

Three case studies, three years and three differing student-led methodologies. The common factor across all three case studies is that they are informed by student engagement and have a student-led focus. Research carried out by a team comprising of academics, support services and students explored the use of learning technologies in higher education with the aim of improving the learning experience for all. We share and explore our use of; students as co-researchers, open space technology, and students as partner methodologies to evaluate and understand the complex questions surrounding technology enhanced learning at one institution to create clear, understandable and actionable information that is negotiated between staff and students. In this paper we contrast the practicalities and lessons learned of each approach and share our developing understanding of student engagement for evaluation and educational development.

How does peer-group mentoring support university teachers' work and well-being?

Keywords: Higher education, Peer interaction, Teacher Professional Development, Workplace learning

Presenting Author:Saara Repo, University of Helsinki, Finland; **Co-Author:**Nina Katajavuori, University of Helsinki, Finland

The aim of this study was to find out whether peer-group mentoring programme can support university teachers' work and

well-being. The pilot programme, based on Finnish school teacher peer-group mentoring model, was launched at Helsinki University. Programme lasted nine months and included training for facilitators and peer-group mentoring process for group participants. The research questions were a) how did the peer-group mentoring work at university context, and b) did the programme have effects on participants, and if so, what kind of effects? Data consisted of 12 interviews of facilitators, who participated to the training, and open-ended answers of 28 participants of peer-groups collected with online questionnaire. Data was analyzed using qualitative inductive content analysis. The results showed that peer-group mentoring supports university teachers' work in versatile ways. First, the most significant was, that participants of the groups represented different disciplines and departments. These heterogeneous groups together with confidential atmosphere promoted fruitful reflections, which helped participants to detect common factors of university teaching and fostered commitment to whole University community. Second, both group members and facilitators experienced participating the programme empowering, and the process strengthened and renewed their identity as university teachers. Third, participants adopted new teaching methods, which they could use with their students. Some facilitators even applied peer-mentoring to research or administrative work. To conclude, peer-group mentoring is excellent social practice, which supports informal and equal learning culture. It makes good use of academics' immense resource, and at the same time, strengthens the identity, self-confidence, and well-being of them.

Socioeconomic Status and Students' Prerequisites in Studies of the Social Sciences

Keywords: Higher education, Intelligence, Motivation, Social aspects of learning and teaching

Presenting Author:Heike Dietrich, Heidelberg University, Germany; **Co-Author:**Eric Klopp, Saarland University, Germany; **Co-Author:**Ying Zhang, saarland university, China; **Co-Author:**Roland Bruenken, Saarland University, Germany; **Co-Author:**Ulrike-Marie Krause, University of Oldenburg, Germany; **Co-Author:**Frank Spinath, Saarland University, Germany; **Co-Author:**Robin Stark, Saarland University, Germany; **Co-Author:**Birgit Spinath, Heidelberg University, Germany

Aim of the current study was to investigate the relationship between university students' socioeconomic status and the personal and situational prerequisites they bring to their studies of the social sciences. Often lacking previous evidence for the area of higher education, we reported results from secondary education. We then investigated the following question: Is social sciences students' socioeconomic status related to intelligence, school grades, achievement motivation, academic self-concept, study interest, the big five factors of personality, and hours of side jobs? To answer our research question, we drew on data from $N = 336$ students of psychology, sociology, and political science in their first semester as bachelor students. Results indicated a positive correlation of socioeconomic status with better school grades ($r = .35$), higher scores in extraversion ($r = .20$), and a negative correlation of socioeconomic status with hours in side jobs ($r = -.25$). Social sciences students' socioeconomic status was not related to intelligence, achievement motivation, academic self-concept, study interest, neuroticism, extraversion, agreeableness, or conscientiousness. Overall, our findings can be seen as meaningful challenges for higher education. We will discuss their implications as well as possible future directions. Additionally, our results suggest that a simple transfer of findings from secondary to tertiary education does not do justice to the complex relations of socioeconomic status with students' prerequisites.

Significant events and skills development in the first year of PhD doctoral students

Keywords: Competencies, Content analysis, Higher education, Researcher education

Presenting Author:Paula Mayoral, Ramon Llull University, Spain; **Co-Author:**Lorena Becerril, Blanquerna, Universitat Ramon Llull, Spain

The purpose of this paper is study the relation between significant events and the skills development of doctoral students starting their doctorate. We analysed the significant events (SE) experienced and skills developed in the first year of doctorate from the students' perspective and we try to find out the relationship between them. Participants were 14 first year doctoral students in Social Sciences from 3 Spanish universities, who answered a semi-structured interview to analyse those positive or negative events (SE) that have lived along the development of their first year of PhD and assess their impact. Results shown that related to the SE, the majority of them are positive, and the most predominant belong to researcher community, research process and scientific communication. Also, related to the Skills involved in the 1st year doctoral students, the majority of them are related to the abilities included in personal and professional management skills. And finally, about the relationship between significant events and skills developed in the 1st year PhD, all the significant events develop some skills and abilities. In fact, there are significant events related with more than one type of skills. Overall, results offer a complex interplay between the mainly experiences and the learning outcomes, the those positive or negative events (SE) and it could have implications for the design of training proposals during doctoral programs, specially thought the first year. **Keywords:** Content analysis, Researcher education, Competencies, Higher Education

Exploring pre-service primary teachers' perception of thinking skills

Keywords: Case studies, Content analysis, Higher education, Teacher Professional Development

Presenting Author:Manoli Pifarré Turmo, University of Lleida, Spain

Research in thinking skills highlights teachers' pedagogical beliefs and concepts about thinking skills influence their instructional practices (Li, 2016). As a result, pre-service teachers' cognition and attitudes are primordial in order to promote a thinking-skills educational system based on innovation and critical thinking. Therefore, it is crucial to research about teacher's conceptions of thinking skills and their attitudes towards implementing these skills in their teaching. Acknowledging these attitudes can help researchers and teachers to construct a better understanding of teacher actions for

developing students' thinking skills. Our paper pretends to contribute to this line of research by focusing on how pre-service teachers understand the concept of thinking skills and providing a base-line data from a sample gleaned from first-year education students. This information will allow teacher training stake-holders to reflect and identify the guiding principles to be introduced in their teaching training programs in order to help the future teachers to implement teaching thinking in their classrooms.

The impact of historical thinking on civic attitudes. Flemish case study migration history

Keywords: Attitudes and beliefs, Citizenship education, History, Instructional design

Presenting Author:Karel Van Nieuwenhuyse, KU Leuven, Belgium; **Co-Author:**Ellen Claes, KU Leuven - University of Leuven, Belgium

In history education, a field of tension exists between contradictory goals, as it is meant to impart moral values to young people, but at the same time has to teach them the ability to freely and autonomously reflect critically. Contrary to policy-makers, history educational scholars put the fostering of historical thinking to the fore in this respect, claiming this automatically contributes to civic behaviour. Since this assumption lacks empirical evidence, our pilot study examines the influence of a history lesson series about migration history (with a focus on fostering historical thinking) on aspects of students' civic attitudes: ethnocentrism and generalized trust. The lesson series were enrolled in three Flemish school 11th-12th grade classes, in 2014, during nine weeks. 64 students participated, and completed a pre- and post-test. A control group of 28 students completed the same tests, in which students' profile and aspects of students' civic knowledge were tested, via hierarchical classification, and judging statements. Data analysis was done via independent t-tests using SPSS software. Unexpected results show up for the course group: a significant increase of ethnocentrism (also when compared to the control group), and a significant decrease of generalized trust. The perceived possibility of them dating people from another ethnic background, by contrast, increases significantly. These results are explained and discussed, taking into account the nature of the questions and the lesson series. We also discuss the necessary balance between (meta)cognitive perspective taking and affective caring while fostering historical thinking and aiming for more open-mindedness to 'the other'.

Self-regulated learning in problem-based learning from the educator's perspective

Keywords: Misconceptions, Qualitative methods, Teaching / instruction, Problem-based learning

Presenting Author:Sanne Rovers, Maastricht University, Netherlands; **Co-Author:**Geraldine Clarebout, Maastricht University, Netherlands

After several decades of successful application at different universities across the world, the effectiveness of problem-based learning (PBL) seems to be diminishing. One of the reasons for this issue could reside in the educators, who may not fully understand the ideas behind the PBL model and what is expected from them in terms of their teaching. In this study, interviews will be conducted with educators at several levels of the problem-based curriculum, in order to assess the perceptions and expectations they have regarding the learning environment and responsibility of students' learning processes. It is hypothesized that there will be important differences between the educators' perceptions and expectations versus the original principles of PBL. Findings from this study could have important implications for future research and the design of interventions to improve or maintain the effectiveness of PBL.

Background Music – Stimulating Effect or Seductive Detail?

Keywords: Comprehension of text and graphics, Experimental studies, Instructional design, Multimedia learning

Presenting Author:Janina Lehmann, Ulm University, Germany; **Co-Author:**Tina Seufert, University of Ulm, Germany

Effects of learning with background music are discussed controversy. There seems to be a stimulation effect of listening to music fostering learning. However, background music provides information not being relevant for the learning task and can thereby be defined as a seductive detail hindering learning. To explain why some learners benefit from background music while others don't, specific learner's characteristics need to be considered. Therefore, this study investigates the influence of background music in interaction with the learner's extraversion level on learning outcomes. Extraversion moderates the

individually preferred level of arousal, getting important while learning with music. 50 students randomly learned a visual text while either listening to instrumental background music while learning or not. Additionally, participants were split into a low and a high extraversion group, depending on their results in an extraversion test. Results show no main effect for background music or extraversion on learning outcomes, but a significant interaction between these two factors. Highly extraverted learners showed no differences in learning outcomes between learning with or without background music, but low extraverted learners showed significantly better results while not listening to music. Compared to low extraverted learners, highly extraverted learners need a higher level of stimulation to be in the best state for learning, which can be exerted by background music. It seems like the positively stimulating and distractive characteristic are balanced for highly extraverted learners, while low extraverted learners are either more easily to distract, don't like this kind of stimulation or both.

Activation of Students' Prior Knowledge in Technology Education in Primary School

Keywords: Engineering, Experimental studies, Primary education, Teaching / instruction

Presenting Author:Dannie Wammes, Utrecht University, Netherlands; **Co-Author:**Liesbeth Kester, Utrecht University, Netherlands; **Co-Author:**Bert Slof, Utrecht University, Netherlands; **Co-Author:**Willemijn Schot, Utrecht University, Netherlands

This study looked at prior knowledge activation (PKA) while learning about a simple electrical (buzz-wire) and a mechanical (stairs-marble-track) problem. We expected using a bottom-up (hands-on) PKA strategy would be beneficial for pupils with low prior knowledge and that a top-down (draw and discuss relations) PKA approach would be more effective for pupils with higher prior knowledge. Due to the difference in perceptual cues about the functioning of system we also expected an interaction effect between PKA approach and problem-solving task; bottom-up would be more effective when more cues are available (stairs-marble-track) and top-down would be more effective when less cues are available (buzz-wire). A two by two factorial design with PKA strategy (bottom-up, top-down) and task (mechanical, electric) was used. Pupils (age 11, SD=0.84, N=180) were tested on their ability to solve a mechanical and an electric problem before (pre-test) and after (post-test) a lesson about these systems. Preliminary results confirm both our expectations. Using a bottom-up strategy was more effective for a) pupils with lower scores on the pre-test and b) solving mechanical problems. Using a top-down approach was especially beneficial for pupils with higher scores on pretest for the electric system.

Interaction-based Coding of Scaffolding

Keywords: Instructional design, Learning analytics, Video analysis, Problem-based learning

Presenting Author:Hanna Mach, Goethe-Universität Frankfurt, Germany; **Co-Author:**Rico Hermkes, Goethe-Universität Frankfurt, Germany; **Co-Author:**Gerhard Minnameier, Goethe-Universität Frankfurt, Germany

Scaffolding can be summarised as "tailored support", emphasising the necessity for teacher's behaviour to be adapted to the student's individual needs. Scaffolding is particularly required when students are stuck in their current understanding. In our video study, we wanted to investigate the quality of scaffolding by analysing teacher-student-interactions. For this, we developed a coding instrument conceptualising both sides of the interaction as variables: the student's task progress (*Student Level of Attainment*) and the teacher's support (*Teacher Strength of Intervention*). By relating both variables to each other, we devised rules for determining *contingency* as the quality of scaffolding, based on the "Contingent Shift Principle". Our methodology proves effective for discerning contingent from non-contingent interaction patterns (micro-scaffolds). In order to correlate contingent scaffolding with learning outcomes, we conducted an empirical study using a Pre-Post-Design, including a 1-year follow up. Inter-rater-reliabilities for each coding step as well as results of the empirical part of study are presented.

Is there an Interplay of Emotional Design and Learning with Inference Prompts?

Keywords: Educational Psychology, Emotion and affect, Higher education, Instructional design

Presenting Author:Sabrina Navratil, University of Mannheim, Germany; **Co-Author:**Tim Kühn, University of Mannheim, Germany; **Co-Author:**Steffi Heidig, Technical University of Dresden, Germany

Self-generated learning (SGL-) activities are one way to support learners' comprehension of new learning material. SGL activities, such as answering inference-prompts, foster learners to work more actively and intensively on learning materials, which in turn may result in deeper comprehension. One aspect that might affect the effectiveness of this learning strategy is the emotional state of learners. Emotional states can be induced through learning materials that consists of essential design elements such as color and shapes (Emotional Design). It is assumed that positive emotional states enhance intrinsic motivation and support the use of productive problem-solving and creative learning strategies. This in turn is supposed to be especially beneficial for self-generating tasks, such as answering inference-prompts. Contrary, negative emotional states seem to lead to rigid, analytical, and detail-oriented learning strategies that might be particularly good for already given information, such as text. This study aims to explore an interplay of learning with learning material (inference-prompts vs. no inference-prompts) and Emotional Design (positive vs. neutral vs. negative): Learners in a positive emotional state should benefit from learning with inference-prompts compared to no inference-prompts by showing better learning outcomes. Contrary, learners in a negative emotional state should benefit from learning without inference-prompts compared to inference-prompts. Learners in a neutral state should profit from learning with inference-prompts (but not in the same extent like learners in a positive emotional state) compared to no inference-prompts. Data collection is in progress. The results will be presented at the conference.

Mindset in Secondary Vocational Education and Training (VET)

Keywords: Educational Psychology, Intelligence, Motivation, Vocational education

Presenting Author: Jaap Glerum, UCR / Utrecht University, Netherlands; **Co-Author:** Sofie Loyens, University College Roosevelt, Netherlands; **Co-Author:** Remigius (Remy) Rikers, UCR / Utrecht University, Netherlands

Previous studies have shown that mindset plays a pivotal role in academic achievement. In particular, students' performance will improve when a student succeeds in developing a growth mindset, particularly in difficult courses and when they are underperforming. This study explores the role of mindset in Secondary Vocational Education and Training (VET). Participants were 1005 VET students attending nine different vocational programmes on three qualification levels in the Netherlands. They filled out an online questionnaire that was combined with information from the school administration system regarding demographical information and grades. Results shows that 13.9% of the participants have a fixed mindset, 47.3% a growth mindset, and 38.8 % a mixed mindset. Our findings indicate that VET students' mindset does not substantially differ from the mindsets that were found in other forms of education. However, a large majority of VET students does not have a growth mindset and hence there is still room to improve the mindset of these students to facilitate academic achievement.

Motivational commercials for framing learning: A large-scale goal-framing intervention

Keywords: E-learning / Online learning, Educational Psychology, Goal orientation, Motivation

Presenting Author: Nicholas Bovee, Kyushu Sangyo University, Japan; **Co-Author:** Luke K. Fryer, The University of Hong Kong, Hong Kong; **Co-Author:** Paul Ginns, University of Sydney, Australia

Research has consistently demonstrated that the quality of students' motivation is a far better predictor of future learning processes and outcomes than the quantity. While experimental research has suggested that the quality of student motivation can be manipulated for short tasks, intervening in student motivation on a broader scale has been pursued less often. The current study undertakes an intervention using of short motivational commercials to stimulate students' instrumental internally-regulated goals for learning English as a second language. An experimental research design was undertaken in a compulsory English language course at one Japanese university. Students (n=1957) were randomly divided into three conditions: 20 exposures to motivational commercials (designed to stimulate internally-regulated instrumental goals), (award winning) TV commercials or no exposure to any videos. Pre-post achievement, interest, utility-value and interest were measured. Students' internally and externally regulated goals were measured every two weeks. Construct validity and reliability of analysis of motivational measures have resulted in acceptable results. Preliminary difference testing suggested non-significant effects for the sample as a whole, but significant effects were observed for subgroups. Further analysis will focus on effects for meaningful subgroups of students who were particularly receptive to the intervention. Theoretical application for goal framing and practical implications for online learning and supporting classroom studies will be presented.

How do cognitive and emotive factors predict academic performance in secondary school children?

Keywords: Achievement, Cognitive skills, Emotion and affect, Student learning

Presenting Author: Enrica Donolato, University of Padova, Italy; **Co-Author:** David Giofrè, Liverpool John Moores University, United Kingdom; **Co-Author:** Irene C. Mammarella, University of Padova, Italy

Academic success is linked with important personal and everyday life outcomes. Several studies focused on the role of cognitive factors such as intelligence and working memory in predicting academic performance. There is also abundant evidence on the role of emotive aspects, and in particular anxiety, on school achievement. Finally, the role of personal factors, such as self-esteem and resilience, has also been noted. However, to the best of our knowledge, only few studies considered the joint role of these factors on academic achievement in children. In the present study, we 141 typically-development children attending sixth and eighth grades were presented with measures of WM, intelligence, anxiety, depression, self-esteem and resilience and academic achievement (including mathematics and reading measures). Results, using structural equation models showed that, for cognitive aspects, intelligence mediates the relationship between verbal and visuospatial WM and both mathematics and reading literacy. Moreover, risk and protective factors were highly correlated. Interestingly, risk factors only predicted mathematic literacy, while emotive protective factors only predicted reading literacy. Overall, the present model explained a large portion of the variance both in mathematics (i.e.,

.89%) and reading literacy (i.e., .73%). Both theoretical and practical implications will be finally discussed.

Self-Regulation and Wellbeing

Keywords: Achievement, Developmental processes, Goal orientation, Self-regulation

Presenting Author:Brigitte Rollett, University of Vienna, Austria; **Co-Author:**Vanessa Radl, Department of Applied Psychology: Health, Development, Enhancement and Intervention, University of Vienna, Austria; **Co-Author:**Helena Hartmann, Department of Applied Psychology: Health, Development, Enhancement and Intervention, University of Vienna, Austria; **Co-Author:**Benedikt Winter, Department of Applied Psychology: Health, Development, Enhancement and Intervention, University of Vienna, Austria

The aim of the study was to investigate the role significant precursors of general wellbeing play in fostering self-regulation (SR). As basis we chose Higgins' Self-Regulation-Focus-Theory (1997) which postulates a promotion-oriented (ProO) and a prevention-oriented (PreO) SR-focus, influencing how people pursue goals and the typical strategies they use. Method. We conducted an online study ($n = 1636$ university students). Instruments: *General Regulatory Focus Measure* (GRFM; Lockwood et al., 2002; scales: Promotion-Oriented, Prevention-Oriented) which measures SR on a strategic basis, *Berner Wellbeing Questionnaire* (BWQ; Grob et al., 1991, scales: Self-Worth, Positive Attitude towards Life, Enjoyment of Life, Depressive Mood), *Neo-Five-Factor-Inventory* (NEO-FFI; Borkenau & Ostendorf, 2008, scales: Extraversion, Agreeableness, Openness, Neuroticism, Conscientiousness).

Results: Regression-analysis showed that promotion- and prevention-orientation differ substantially on the BWQ dimensions: For a ProO-regulatory-focus, the following predictors evinced: Positive Attitude towards Life (p

Intra-individual variation in homework effort: Analyzing the effect of gender and conscientiousness

Keywords: Educational Psychology, Emotion and affect, Out-of-school learning, Parental involvement in learning

Presenting Author:Desiree Theis, German Institute for International Educational Research (DIPF), Germany; **Co-Author:**Brigitte Brisson, German Institute for International Educational Research (DIPF), Germany

One of the most discussed subjects in terms of school is homework. Teachers often argue that homework serves as a valuable tool for students to gather deep knowledge about given subjects and for themselves to evaluate students' learning process. Recent research indicates that homework effort and emotions significantly affect its efficacy. It is supposed that homework effort and emotions are not stable within individuals but fluctuate depending, for instance, on individual student characteristics and the characteristics of the homework assignment. However, research on the reasons for intra-individual variation in homework effort and emotions is still rare. On the inter-individual level, students' gender, personality traits, and parental support have been shown to predict homework effort and emotions. The present study aims to investigate fluctuation rates of homework effort and emotions within students during a period of three weeks. Parental support, gender, and conscientiousness will be assessed as predictors of intra-individual variations in homework effort and emotions. The experience sampling method (ESM) is used to assess data on students' homework effort and emotions right in the moment of the homework experience in a sample of 624 students in Grade 5. Time series analysis is used to assess intra-individual variations in homework effort and the influence of parental support, students' gender, and conscientiousness on such variations.

Intervening to promote engineering student success in technical, non-major, required barrier courses

Keywords: Achievement, Engineering, Higher education, Motivation

Presenting Author:Jenefer Husman, University of Oregon, United States; **Co-Author:**Katherine Nelson, Rowan University, United States; **Co-Author:**Kat Cheng, Arizona State University, United States

The current project examined university engineering students' motivation at the beginning of the semester (baseline) and at the end of the semester (final), and whether an intervention was beneficial for motivation development. Motivational variables included Future Time Perspective Connectedness (FTPC), Endogenous Perceptions of Instrumentality (PIEN), Utility Value (UV), Interest, and Belongingness (BEL). Students ($N = 257$) were randomly assigned to a control group or intervention group. Results indicated that engineering students who identified more with their engineering career at beginning of semester (baseline FTPC and BEL) viewed their non-major class (Introduction to Biology) as more instrumental for future goals during baseline (PIEN). However, this career identity was not associated with end of semester motivation in class (UV, Interest). Instead, both baseline and final PIEN were significantly positively associated with final UV and Interest. Interestingly, for engineering students taking a non-major course, PIEN, UV and Interest dropped over the semester (baseline vs. final) regardless of the intervention. Our findings imply the importance in sustaining motivation in engineering students when taking non-major courses.

Regulation of Collaboration: Regulatory Knowledge and Performance in Problem-based Learning

Keywords: Collaborative Learning, Higher education, Metacognition, Mixed-method research

Presenting Author:Jun Oshima, Shizuoka University, Japan; **Co-Author:**Ritsuko Oshima, Shizuoka University, Japan;

Co-Author:Takashi Shibata, Shizuoka University, Japan

We conducted a study by fusing the questionnaire and performance analysis approaches for elucidating the relationship between prior knowledge of collaboration and regulatory performance in collaborative learning. We first constructed four collaborative learning scenarios to ask students how they would behave in the situations presented and conducted it before their collaboration. We then used a CSCL system to support and record students' reflections on their regulatory performance. Online logs and field notes were used as process data. Among 188 university students participating in a project-based learning curriculum, 13 high-regulatory performance and 18 low-regulatory performance students were selected as a sample for the analysis. A t-test of questionnaire scores revealed that scores by high-performance students were significantly higher, suggesting that prior knowledge influences regulatory performance in collaborative learning. Case studies based on online logs and field notes revealed that students with high prior knowledge used facilitative co-regulation strategies to improve their group regulatory performance when perceiving a socio-emotional challenge, and that students with high prior knowledge used self-regulatory strategies when perceiving a socio-cognitive challenge.

Integrative possibilities in doctoral supervision: A four quadrant model

Keywords: Doctoral education, Higher education, Qualitative methods, Researcher education

Presenting Author:Kylie Shaw, SORTI, The University of Newcastle, Australia; **Presenting Author:**Allyson Holbrook, SORTI, The University of Newcastle, Australia

There is a dearth of research that addresses how doctoral supervisors perceive and articulate their instructional roles and breadth of responsibilities in light of new programs and changing sectoral expectations. This paper responds to the need for a model of doctoral supervision that can capture and represent the focus, range and complexity of instructional intentions, practices and possibilities. Building on the substantive literature on supervision, changing doctoral programs, and relatively new empirical findings about supervision and learning, the authors construct a holistic model of supervision ranging across micro-macro and product-person dimensions. The model is further explained and illustrated using four supervisor cases in Fine Art. Accommodating the roles and contribution of multiple actors, including supervisory teams, the model offers a heuristic to identify existing emphases, alignments and integrative possibilities within and across disciplines, programs and stages in candidature.

Instruction on disagreement resolution in reasoning about multiple documents

Keywords: Argumentation, Literacy, Reasoning, Science education

Presenting Author:Toshio Mochizuki, Senshu University, Japan; **Co-Author:**Clark Chinn, Rutgers University, United States; **Co-Author:**Etsuji Yamaguchi, Kobe University, Japan; **Co-Author:**Randi Zimmerman, Rutgers University Graduate School of Education, United States

The aim of this study is to develop instruction to enable students to learn to detect and analyze disagreements among multiple conflicting texts. We developed and investigated the effects three forms of instruction intended to promote better reasoning about disagreements in multiple document tasks. (1) Instruction focused on "Causal Analysis" (CA) directed students to analyze causal expressions in documents. (2) Instruction focused on "Disagreement Detection" (DD) taught students to identify disagreements among the causal relationships in addition to identifying causal expressions. (3) "Disagreement Explanation" (DE) instruction included the components of CA and DD but additionally taught students about common explanations for disagreement, such as having access to different evidence. Ninety-three Japanese students were trained under one of these three conditions in two weekly sessions and then in a third session wrote a comprehensive essay regarding a set of conflicting texts about dieting methods. The result showed that the students who received DD and DE instructions reached different conclusions from those who received only CA instruction. This indicates the effectiveness of training students to detect disagreements. This paper discusses the potential of DD and DE instructions which encourages students to reason more deeply about disagreements among conflicting information in multiple documents. We also discuss future needed directions to promote better reasoning about disagreements in multiple documents.

Is genetic engineering threatening my life? Fostering decision-making processes in risk perception

Keywords: Argumentation, Quantitative methods, Science education, Student learning

Presenting Author:Martina Heist, University Koblenz-Landau, Germany; **Co-Author:**Jochen Scheid, University Koblenz-Landau, Germany; **Co-Author:**Alexander Kauertz, University Koblenz-Landau, Germany; **Co-Author:**Sandra Nitz, University Koblenz-Landau, Germany

Today we live in a complex environment in which new technologies keep emerging, promising to simplify everyday life. But

some of these technologies seem to prompt negative feelings among the population, even though experts consider them to be harmless. At the same time, the perception of hazardousness of new technologies is not only influenced by our knowledge about these technical developments. In fact, quite a number of factors determine the individually perceived risk. The present study aims to investigate how personal opinions and values, personal characteristics like anxiety, or varying sources of information influence students' perception of risk in the field of Genetic Engineering (GE). How we arrive at specific perceptions is part of a decision-making-process. Within this process arguments are considered to come to a personal conclusion about whether a certain technology represents a possible threat for us. Based on this framework, we will examine if and how much individual risk perception of GE in students can be altered by a teaching unit that consists of an argumentation-training on the issue of GE in food production.

Prompting collaboration with scripts and architectural design in start-up companies

Keywords: Case studies, Collaborative Learning, Design based research, Workplace learning

Presenting Author: Arttu Mykkänen, University of Oulu, Finland; **Co-Author:** Piia Markkanen, University of Oulu, Finland, Finland; **Co-Author:** Aku Visuri, University of Oulu, Finland, Finland

Start-up companies might encounter challenges in their collaborative knowledge creation process. Reasons for these challenges may be a consequence of spatial limitations and undefined ways of collaboration. The objective of this research project is to analyse how to create a work environments that support innovation and collaborative knowledge creation in start-up companies. Through studying collaborative knowledge creation and architectural features from employee's perspective, it is possible to influence innovativeness of start-up companies. This proposal presents the current research project and further enlightens the development of upcoming phases based on the analysis of the collected data. Design based research is used to study prospects and challenges of working environments and these features are developed through concept design and pilot experiments in start-up company premises. A selection of different qualitative and quantitative methods are implemented to triangulate different aspects of employees' collaborative work and work environment.

Exploring dialogue transformation in hybrid classrooms

Keywords: Design based research, Mixed-method research, Reasoning, Secondary education

Presenting Author: Jo Inge Johansen Frøythog, University of Oslo, Norway

This poster reports on a PhD project that explores how dialogues are being transformed in hybrid classrooms. The project is part of a larger research collaboration, Digitalised Dialogues Across the Curriculum (DIDIAC), between the University of Oslo and the University of Cambridge, where design-based interventions are used to investigate how classroom dialogues and the use of digital technology come together to foster the development of 21st-century skills, particularly collaboration and critical thinking skills (evaluating and integrating information, forming ideas, and justifying and communicating in and across knowledge domains).

Teachers and students will use a microblogging tool, Talkwall, which was designed to facilitate classroom discussion. Talkwall provides new ways to construct, distribute, organise and integrate knowledge, both individually and collectively, in a safe, localised environment (Rasmussen & Hagen, 2015). Therefore, it has the potential to expand the dialogic space (Wegerif, 2007). This expanded space is also a hybrid space, in which the dynamics between oral, written and digital dialogues are played out between the participants.

Research questions

1. How are dialogues transformed when they fluctuate between the analogue and digital arenas of hybrid classrooms?
2. To what extent do these transformations change the preconditions for meaningful participation in joint knowledge construction?
3. To what extent do these transformations contribute to the development of critical thinking and collaboration skills? A combination of qualitative and quantitative methods will be used to investigate these questions on individual, social and cultural levels of analysis.

Relating information of different teacher knowledge components: Effects of writing tasks and prompts

Keywords: Comprehension of text and graphics, Instructional design, Pre-service teacher education, Reading comprehension

Presenting Author: Thomas Lehmann, University of Bremen, Germany; **Co-Author:** Benjamin Rott, University of Duisburg-Essen, Germany; **Co-Author:** Florian Schmidt-Borcherding, University of Bremen, Germany

This paper reports on an experiment that examined the effects of essay writing tasks and task-supplemental prompts on pre-service mathematics teachers' integration of information from multiple documents that pertain to the core components of their professional knowledge. The study rests on findings about the efficacy of argument tasks and prompts, as well as methodical approaches for assessing information integration in multiple-documents learning settings. Also, the study builds on teacher competence models that include three conceptually different knowledge components, that is, content knowledge (CK), general pedagogical knowledge (PK), and pedagogical content knowledge (PCK). Hence, unlike the material used in most prior multiple-documents studies, the documents used in the present research pertained to these components and, hence, originated from different domains. The CK text included subject-matter knowledge on mathematical proving. The PK text included conceptual educational knowledge about information processing and the design of lessons. The PCK text included knowledge about pupils' difficulties in mathematical reasoning and proving. $N=100$ pre-service teachers for mathematics in primary schools took part in a laboratory experiment. Depending on their experimental condition they received either an unspecific or an argument writing task (factor 1), and either task-supplemental prompts or no prompts (factor 2). Results of a category driven analysis of participants' essays suggest that pre-service teachers' construction of an integrated mental model across the core components of their professional knowledge can be enhanced by argument tasks and prompts. Within-domain knowledge acquisition was not interfered by stimulating integration processes. Results are discussed within the realm of multiple-text understanding.

Educating trainee teachers through video modeling to manage confirmation bias in decision making

Keywords: Educational Psychology, Higher education, Instructional design, Pre-service teacher education

Presenting Author: Suzan van Brussel, Avans University of Applied Sciences, Netherlands; **Co-Author:** Miranda Timmermans, Avans Hogeschool / Avans University of Applied Sciences, Netherlands; **Co-Author:** Peter Verkoeijen, Erasmus University Rotterdam, Netherlands; **Co-Author:** Fred Paas, Erasmus University Rotterdam/University of Wollongong, Netherlands

When people make judgments, they use mental shortcuts. These heuristics frequently yield accurate judgments but can give rise to systematic thinking errors of inductive reasoning known as cognitive biases (Nickerson, 1998; Tversky & Kahneman, 1974). A particularly pervasive bias is confirmation bias (Nickerson, 1998). This refers to the unconscious selectivity in the acquisition and use of evidence in the search for information. In primary school education, confirmation bias amongst teachers might have negative consequences for pupils. Hence, it is important to prevent confirmation bias in primary school teachers. To achieve this goal, instruction to *trainee teachers* should aim at reducing confirmation bias and helping them in making fair decisions in the classroom. Previous findings (e.g., Koriat et al., 1980; Lord et al., 1984; Morewedge et al., 2015) suggest that instruction based on the consider-the-opposite (COS) technique might be effective in preventing confirmation bias. Furthermore, findings from the instructional design literature (Van Gog & Rummel, 2010; Hoogerheide et al., 2014) suggest that video-based modeling may be suited to deliver a COS instruction. However, it is an open question whether a video-based modeling COS instruction should use authentic or general tasks. In the present study we address this question for trainee teachers by comparing an authentic video based modeling COS instruction to a more general video based modeling COS instruction. Based on the existing literature on CT (e.g., Abrami et al., 2015), we hypothesize that authentic instruction will produce the best performance on practiced final test items and non-practiced final test items.

Should pictures be drawn during a lesson or presented already-drawn?

Keywords: Comprehension of text and graphics, Experimental studies, Instructional design, Multimedia learning

Presenting Author: Leonora Coppens, Utrecht University, Netherlands; **Co-Author:** Liesbeth Kester, Utrecht University, Netherlands

Pictures are often used to accompany a verbal explanation. These pictures can be drawn during the explanation or presented already-drawn. There has been little research up to now into which of these methods is most effective. Investigating this can yield interesting results for education. In the current study, we let undergraduate students watch an illustrated narration about early embryonic development. The illustrations are either drawn during the lesson or presented already-drawn and there is a hand drawing or pointing at the pictures, or no visible hand. We measure retention of the presented information and collect interest ratings. The results will be discussed in light of Mayers' multimedia principles.

Poking the cognitive process of tracing in learning via think aloud.

Keywords: Achievement, Educational Psychology, Experimental studies, Instructional design

Presenting Author: Paul Ginns, University of Sydney, Australia; **Co-Author:** Michael Tang, University of Sydney, Australia; **Co-Author:** Michael Jacobson, University of Sydney, Australia

Based on empirical studies demonstrating pointing-based gestures may act to guide visual attention while learning (e.g. Dodd & Shumborski, 2009; Fischer & Hoellen, 2004), and experimental research inspired by Montessori's (1912) *sandpaper letters* (e.g. Kalenine, Pinet, & Gentaz, 2011), a series of studies (Aghostino et al., 2015; Hu et al., 2015; Ginns et al., 2015) have found explicit instructions to point and trace with the index finger enhances learning from worked examples across a range of mathematics topics. The current study extends research on tracing gestures to examine how tracing gestures affect cognitive processing and learning from expository text and diagrams drawn from the science curriculum. Primary school students ($n = 10$) were instructed to think aloud while studying a booklet followed by a poster on the water cycle; half of the participants traced out elements of the diagram while studying, while the other half were instructed not to gesture. Verbal protocol analysis (currently being performed) will be used to elucidate the effects of tracing while studying. Results and possible cognitive mechanisms will be presented at the conference.

Effects of modality of feedback presentation on post-feedback behavior in task-oriented reading

Keywords: Cognitive skills, Computer-assisted learning, Reading comprehension, Self-regulation

Presenting Author: Amelia Mana, University of Valencia, Spain; **Co-Author:** Vicenta Avila, University of Valencia / Interdisciplinary Research Structure for Reading Research (ERI Lectura), Spain; **Co-Author:** Eduardo Vidal-Abarca, Universidad de Valencia, Spain

We tested two different modalities of feedback presentation (oral and written-feedback) in a computer-based educational environment for 7th and 8th graders. We investigate to what extent the modality of presentation has an effect on the post-feedback behavior and on performance as well, in a task-oriented reading situation. Additionally, we are also interested in to test the role of general comprehension and working memory level of students. We expected that (a) oral feedback will benefit students (in post-feedback behavior and in performance) and that (b) this kind of feedback will be especially useful for less-skilled students in working memory. As this is an ongoing study, results will be presented at the conference.

Examining Collective Inquiry and Knowledge Advances in a Knowledge Building Environment

Keywords: Computer-supported collaborative learning, Mixed-method research, Secondary education, Knowledge creation

Presenting Author: Yuyao Tong, The University of Hong Kong, China

This paper examined the role of a designed computer-supported knowledge building environment on domain knowledge, nature of Knowledge Forum® (KF) contribution, and explanatory and collective inquiry in KF. Participants were forty Grade 9 students studied in a Chinese language and literature course in a Hong Kong secondary school. Students worked in a computer-supported knowledge building environment used Knowledge Forum® (KF), an online discussion platform, to engaged in the collaborative inquiry and pursued of idea improvement. Analyses indicated that there is a significantly pre-post improvement in domain knowledge; as well, students also viewed their experience in knowledge building classroom more positively in terms of collaboration and learning approaches. Correlation analysis suggested that KF participation, KF engagement, students' explanatory inquiry, views of collaboration and learning approaches were correlated. Furthermore, regression analysis showed that students' KF participation, rise-above efforts, and KB explanatory inquiry predicted students' domain understanding. Implications of examining the knowledge building environment on students' views on collaboration, approaches to learning and domain knowledge are discussed.

Educational Policy and Systems, Motivational, Social and Affective Processes

PO: Motivation and Educational Evaluation

Keywords: Assessment methods and tools, Attitudes and beliefs, Culture, Educational policy, Educational Psychology, Emotion and affect, Experimental studies, Goal orientation, Motivation, Motivation and emotion, Primary education, Quantitative methods, School effectiveness, Special education, Survey Research, Teaching / instruction

Interest group: SIG 08 - Motivation and Emotion, SIG 23 - Educational Evaluation, Accountability and School Improvement

Chairperson: Angelika Kullberg, University of Gothenburg, Sweden

"I don't feel alone": Young girls' emotional bonds with media

Keywords: Attitudes and beliefs, Culture, Primary education, Motivation and emotion

Presenting Author: Susan Beltman, Curtin University, Australia; **Presenting Author:** Madeleine Dobson, Curtin University, Australia

There are concerns regarding the use and impact of media in relation to adolescent girls and young women, but there is relatively little research focusing on the experiences and perceptions of young girls. This paper reports some of the findings of a larger, five phase, feminist, mixed research study in a small Australian school. Interviews with educators ($n=5$), parents ($n=7$) and young girls ($n=14$) were analysed using a phenomenological approach to elicit key themes for each group. Common and contrasting perspectives were then identified. Adults felt that media were powerful and pervasive but also expressed some reservations about the proliferation of media and the representations of girls and women. The adults set

boundaries and enabled various levels of access for the young girls who showed strong emotional and intellectual engagement with a variety of media. While further research is needed to examine children's views, the findings point to some recommendations for parents and educators as well as a broader conceptualisation of the position of media in our society.

Teachers' Emotions: lesson, student-group and teacher effects

Keywords: Emotion and affect, Quantitative methods, Teaching / instruction, Motivation and emotion

Presenting Author:Lars-Erik Malmberg, University of Oxford, United Kingdom; **Co-Author:**Reinhard Pekrun, Ludwig-Maximilians-Universität (LMU), Germany

Teaching can be an inspiring profession reflected in positive emotions and a sense of accomplishment. At the same time it can be a stressful profession, reflected in negative emotions and exhaustion. Teachers' emotions are associated with experiences in lessons, student groups, relations with colleagues and parents of students, and personal characteristics. Following Pekrun's (2006) control-value theory we posited that emotions would be related to situation-specific mastery experiences, student engagement in lessons, and teachers' trait characteristics. Going beyond previous studies of teachers' emotions we investigated situation-specific positive emotions (vitality and positive affect) and negative emotions (anxious and hostile affect) in 1055 lessons with 385 student groups of 43 teachers in England. We collected situation-specific measures of these variables toward the end of each lesson using an electronic questionnaire in handheld computers (Personal Digital Assistant). An a priori four-factor model was specified using two-level and three-level Bayesian structural equation models in Mplus: vitality (enthusiastic, energetic), positive affect (calm, relaxed), anxious affect (nervous, tense), and hostile affect (angry, frustrated). We included predictors at the lesson-level (situation-specific mastery experiences and perceived students' behavioural engagement and engagement with learning) and teacher level (teacher self-efficacy, gender, teacher experience, sense of accomplishment, and exhaustion). At the lesson-level vitality and positive affect were positively associated with mastery experiences and student engagement. Anxious and hostile affect were negative associated with mastery experiences and student engagement. At the teacher-level vitality and positive affect were associated with a sense of accomplishment.

The effect of praise by friends on intrinsic motivation

Keywords: Educational Psychology, Experimental studies, Goal orientation, Motivation

Presenting Author:Kyosuke Kakinuma, Doshisha University, Japan; **Co-Author:**Ayumi Tanaka, Doshisha University, Japan

Much research has demonstrated that people who receive ability-focused praise tend to hold to entity theory (a view of intelligence as a fixed trait), and their intrinsic motivation decreases. People who receive effort-focused praise hold to incremental theory (a view of intelligence as malleable), and their intrinsic motivation increases. However, these studies focused on praise by top-position individuals (e.g. teacher, parent, experimenter). The current research examined whether ability or effort praise by friends also affected intrinsic motivation. We used a friendship situation in which the students worked on the same task to measure motivation (e.g. students take the same tests in the classroom). Thus, participants and confederates worked on the same task, and confederates praised participants for their performance. Results suggested that effort praise could positively affect intrinsic motivation, although praise did not affect theories of intelligence. The finding partly supports the idea that praise by friends affects intrinsic motivation.

Emotion regulation and achievement emotions in elementary school children: longitudinal data

Keywords: Emotion and affect, Primary education, Quantitative methods, Motivation and emotion

Presenting Author:Daniela Raccanello, University of Verona, Italy; **Co-Author:**Margherita Brondino, University of Verona, Italy; **Co-Author:**Angelica Moè, University of Padova, Italy; **Co-Author:**Stephanie Lichtenfeld, Ludwig-Maximilians-Universität, Munich, Germany

The role played by achievement emotions in influencing students' wellbeing and performance is increasingly gathering attention within the psychological literature (Pekrun & Linnenbrink-Garcia, 2014). However, just a few studies have focused on how emotion regulation, one possible antecedent of achievement emotions, may affect achievement emotions over time within specific contexts. Therefore, our main aim was to examine how elementary school students' emotion regulation predicted achievement emotions across the elementary school years, examining also how achievement emotions changed over time. In the present study 308 Italian children were asked to complete two self-report instruments when attending second and fourth grade and one year later these two cohorts were again investigated. On both occasions students answered the "How I Feel" questionnaire (HIF, Walden, Harris, & Catron, 2003) to evaluate their emotion regulation abilities, and the "Achievement Emotions Questionnaire—Elementary School" (AEQ—ES, Lichtenfeld, Pekrun, Stupnisky, Reiss, & Murayama, 2012) to assess three emotions (enjoyment, anxiety, and boredom) within domains (Italian, mathematics). Results revealed decreases in positive emotions and increases in negative emotions over time. In addition, we found that emotion regulation abilities could play a role as antecedents of students' emotional experiences, as assumed by Pekrun's control-value theory (2006). Despite limitations, this knowledge could be useful in planning intervention programs to promote students' wellbeing and performance, focusing on emotion regulation as an important source of achievement emotions.

Distribution of resources: A quantitative study on logics of action within inclusive schools

Keywords: Educational policy, Primary education, Quantitative methods, Special education

Presenting Author:Jennifer Lambrecht, University of Potsdam, Germany; **Co-Author:**Stefanie Bosse, University of Potsdam, Germany; **Co-Author:**Thorsten Henke, University of Potsdam, Germany; **Co-Author:**Katja Bogda, Universität Potsdam, Germany; **Co-Author:**Nadine Spörer, University of Potsdam, Germany

As 167 state parties ratified the Convention on the Rights of Persons with Disabilities, they are to ensure that children with special educational needs (SEN) receive the support required to participate in the general educational system. Hence, in many countries educational politicians allocate additional resources to inclusive schools. When those resources are distributed within schools, the underlying logic of action might differ from the one intended and between schools. In our study we focused on the question to what extent underlying logics to distribute personnel resources differ between schools, even though they act under the same political conditions. The sample to address this question consisted of $N = 76$ primary schools, that received the same personnel quotas. In a standardized questionnaire, school principals reported for each class in their school (a) how many students with administrative relevant attributes (e.g., SEN) learned in a class and (b) how many recourses from specific personnel quotas were present in that class (e.g., two hours from quota for students with SEN). Underlying logics were assumed if significant relations between personnel quotas and students' attributes occurred. Preliminary analyses revealed high variation in the correlation coefficients between schools. Further analyses are being conducted to identify schools that use similar patterns of logics of actions.

The impact of evaluation context, motivation and social desirability on school self-evaluation data

Keywords: Assessment methods and tools, Educational policy, School effectiveness, Survey Research

Presenting Author:Jerich Faddar, University of Antwerp, Belgium; **Co-Author:**Jan Vanhoof, University of Antwerp, Belgium; **Co-Author:**Sven De Maeyer, University of Antwerp, Belgium

School self-evaluation (SSE), as a means to enhance educational has gained a prominent position in many education systems. An SSE process is characterised by collecting data on a school's functioning, where a judgement is made upon in order to take decisions within the framework of school development. These data are often collected by administering questionnaires among teachers working in the school. However, in order to obtain quality data it is vital that respondents are motivated to fill in the questionnaire, and avoid to respond socially desirable, both in a development or accountability evaluation context. This study aims to examine to what extent respondents' motivation and tendency towards socially desirable responding is affected by the evaluation context, and to what extent there is an impact on SSE results. An authentic SSE with a quasi-experimental design has been set up in an educational service organisation in Flanders (Belgium). Findings show that evaluation context has no significant impact. However, variance in respondents' motivation and tendency towards socially desirable responding has indeed an effect on SSE results. The paper discusses the findings for theory development within the field of SSE research and the implications for SSE practitioners.

Teaching and Teacher Education

PO: Teaching Approaches

Keywords: Attitudes and beliefs, Citizenship education, Cognitive skills, Collaborative Learning, Competencies, Higher education, Interdisciplinary, Knowledge creation, Metacognition, Mixed-method research, Pre-service teacher education, Qualitative methods, Reflection, Teacher Effectiveness, Teacher Professional Development, Teaching / instruction, Teaching approaches, Video analysis

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Ann-Carita Evaldsson, Uppsala University, Sweden

Linking the unlinkable – transdisciplinary collaboration between universities and business

Keywords: Citizenship education, Collaborative Learning, Interdisciplinary, Knowledge creation

Presenting Author:Petra Biberhofer, Vienna University of Economics and Business, Austria; **Co-Author:**Claudia Lintner, Free University of Bolzano, Italy; **Co-Author:**Johanna Bernhardt, Terra Institute, Italy; **Co-Author:**Marco Rieckmann, University of Vechta, Germany

Sustainable development needs the active participation and collaboration of many different actors in society. Clearly there is a need for new learning settings supporting solution strategies responding to current challenges manifested in ecological, social, political and financial crises. Transdisciplinary collaboration between universities and business enable both parties to respond to many challenges deriving from global transformation processes. Their potential to overcome the existing theory practice gap and promotion of sustainable innovations is an essential contribution for the transformation towards a sustainable society. The theoretical framework is built on the concepts of transdisciplinarity, transformative education, science-society interfaces and sustainability-driven entrepreneurship. The paper asks how education for sustainable development in general and for sustainability-driven entrepreneurship in particular can be fostered by creating and implementing innovative collaboration forms between universities and business. The empirical data is based on 75

qualitative semi-structured interviews conducted with entrepreneurs and university teachers. Three good practice examples of collaboration formats are discussed in detail. The findings illustrate different settings and key features applied by regional knowledge alliances of heterogeneous stakeholders. The experimental formats are oriented towards three core aspects of a transformative learning approach (1) demand driven integration of sustainability topics (2) innovative learning methods and (3) transdisciplinary learning spaces. Further it is explained how understanding, sharing and promoting those features can help to upscale collaboration strategies to a transnational scale. In sum, the paper provides valuable bridging strategies helpful for political and societal decision-making as it elaborates on mutual learning processes of rather detached worlds – universities and business.

The role of beliefs in teacher education. Reflecting on pedagogical beliefs

Keywords: Qualitative methods, Reflection, Teacher Effectiveness, Teacher Professional Development

Presenting Author: Eveline Christof, University of Innsbruck, Austria

This contribution will focus on the factor of teacher beliefs and their role in teacher education. Beliefs, attitudes or subjective theories play a key role in teachers' actions and their behavior in the classroom. Teacher training at the university is limited by breaking up these strong behavior-determining elements. This is the background for the unchanged passing of patterns about the structures of school in general and about teaching and learning in particular from one generation of teachers to the next. (cf. Blömeke 2004, Richardson 1996, Zeichner 1986) Professional teacher education has to provide different settings for teacher students to reflect upon their beliefs about school, teaching and learning. Reflection is a central topic at all teacher training institutions. Teacher training institutions developed different ideas and concepts in order to implement some forms of reflection in teacher education. (f.e. Rothers 2012, von Felten 2005, 2011) This contribution shows the implementation of a method which is experimentally applied in the field of teacher education at the University of Innsbruck to stimulate students' reflective competence. Moreover, first results of the application of the method are presented. Central research question: How can teacher students reflect upon their pedagogical beliefs during their teacher education studies to develop a professional self.

How do situated competences in classroom management develop over teacher education?

Keywords: Competencies, Higher education, Pre-service teacher education, Teacher Professional Development

Presenting Author: Bernadette Gold, University of Erfurt, Germany; **Co-Author:** Manfred Holodynski, University of Muenster, Germany

Classroom management problems are important stressors of beginning teachers and experienced teachers (Veenman, 1984), and student teachers claim to be ill-prepared for dealing with student misbehavior and inattention (Jones, 2006). Therefore, one important aim of teacher education should be a situated and practice-oriented preparation on classroom management. The aim of the present longitudinal study was to investigate whether professional vision and strategic knowledge of classroom management, as two situated and practice-relevant classroom management competences, develop over bachelor and master studies as well as over the practice phase in teacher education (the *Referendariat* in Germany).

193 primary student teachers participated in their first and their fifth or sixth bachelor semester. Further 102 primary student teachers from several German universities participated in their first and last master semester as well as at the end of their *Referendariat*.

Latent change analysis with respect to the *professional vision* of classroom management indicated a significant latent increase from the beginning to the end of the bachelor studies ($d = 0.39$) as well as from the beginning to the end of the master studies ($d = 0.68$). There was no significant latent change from the end of the master studies to the end of the *Referendariat*.

The *strategic knowledge* of classroom management did not significantly change during the university phase of teacher education. From the end of the master studies to the end of the practice phase a significant latent increase occurred ($d = 0.25$).

Teachers' Epistemic Cognition in Classroom Assessment

Keywords: Attitudes and beliefs, Cognitive skills, Metacognition, Teaching / instruction

Presenting Author: Helenrose Fives, Montclair State University, United States; **Co-Author:** Nicole Barnes, Montclair State University, United States; **Co-Author:** Michelle Buehl, George Mason University, United States; **Co-Author:** Julia Mascadri, Queensland University of Technology (QUT), Australia; **Co-Author:** Nathan Ziegler, South Dakota State University, United States

Teachers' epistemic cognition refers to the processes teachers engage in when they consider the nature of knowledge (its source, structure, certainty, and justification) for themselves as learners or for their students. In this theoretical essay we theorize a model of epistemic cognition that illustrates teachers' epistemic cognition when engaged in assessment tasks. To explicate the role of epistemic cognition in teaching, we present a hypothetical case of Dr. Jones, an educational psychology instructor, to illustrate how epistemic concerns manifest in assessment activities. We propose that our model adds to prior frameworks of epistemic cognition in four ways: First, we argue that the development of an epistemic aim for others actively requires (or should) the processes of epistemic cognition. Second, more attention needs to be given to the alignment of reliable processes with identified epistemic aims to produce the desired epistemic end. Third, in teachers'

practice the use of epistemic cognition is multifaceted and iterative. Fourth, scholars in this area need to find ways to make teachers' cognition visible to support their ability and willingness to critically reflect on epistemic issues in their practice. We close the proposal with conclusions and recommendations for further theory and research.

The impact of staged video vignettes on teachers' nonverbal classroom management knowledge

Keywords: Pre-service teacher education, Teacher Professional Development, Video analysis, Knowledge creation

Presenting Author: Julia Bönnte, University of Duisburg-Essen, Germany; **Presenting Author:** Rijana Nissing, University of Duisburg-Essen, Germany; **Co-Author:** Gerlinde Lenske, Universität Koblenz-Landau, Germany; **Co-Author:** Theresa Dicke, Australian Catholic University, Australia; **Co-Author:** Detlev Leutner, University of Duisburg-Essen, Germany

Due to a mounting teacher shortage and rising burnout rates, the importance of teacher training is increasingly recognized (Dicke, Elling, Schmeck, & Leutner, 2015; OECD, 2016). To improve teacher training, it is necessary to include pedagogical-psychological professional knowledge in regard to classroom management (CM). Indeed, Hattie (2009) reports a positive correlation between CM and students' achievement (Hattie, 2009). Furthermore, research has found a connection between teachers' perception of classroom management skills, occupational satisfaction and wellbeing (Dicke et al., 2014). One promising way to support the development of CM skills is the usage of staged video material based on authentic classroom situations. This is applied in our research project *Video-based educational material/classroom management*, part of the *Quality initiative in teacher training*. Particularly inexperienced teachers do not feel sufficiently prepared with regard to CM skills (Evertson & Weinstein, 2006). Hence, innovative educational material will already be applied during the course of studies to enable a more practice-related acquisition of CM knowledge. For this purpose, video examples of both, more and less successful classroom actions, will be employed. The effectiveness of the video material is going to be tested in comparative studies. After this, the developed vignettes will be provided on a video platform for the usage in university education as well as further and continuing education.

Need for Cognitive Closure of Student Teachers and Their Classroom Management Practice

Keywords: Cognitive skills, Mixed-method research, Pre-service teacher education, Teaching approaches

Presenting Author: Katerina Vlckova, Masaryk University, Czech Republic; **Presenting Author:** Katerina Lojdova, Masaryk University, Czech Republic; **Co-Author:** Jan Mares, Faculty of Education, Masaryk University, Brno, Czech Republic; **Co-Author:** Jan Sirucek, Faculty of Social Sciences, Masaryk University, Brno, Czech Republic

Classroom management (CM) can be viewed as a system of strategies employed by a teacher to influence the physical/social space of the classroom to foster an environment where learning can occur. One of the key individual characteristics influencing the teachers' CM strategies (CMS) is their need for cognitive closure (NFC) which can be defined as individual's motivation in information processing and judgement. The relation of NFC and CMS was investigated on a non-probability sample of student teachers in their first year in master study programme – in their long term practice in lower secondary schools. Data were collected by video-recordings of classes, interviews, diaries and questionnaires in a mixed methods design. Regarding questionnaires, CMS were measured by the adapted Behavior and Instructional Management Scale – BIMS (Martin & Sass, 2010). Need for cognitive closure was measured by the adapted Need for (Cognitive) Closure Scale – NFCS (Roets & Van Hiel, 2011; Czech version Širůček et al., 2014). Confirmatory factor analysis and reliability estimates supported the predicted structure of the two scales. NFC is reflected in the CMS of student teachers. Student teachers with higher NFC use more CMS focused on rules and leading the classroom. The higher the NFC is the more the student teachers prefer teaching in frontal settings, deviate less from their lesson plan; they have more strict requirements of student's discipline, and insist on students to follow the rules. These findings show that NFC plays an important role in teacher behaviour and should be therefore reflected in teacher education as well.

Session I 10

31 August 2017 12:00 - 13:30

Linna - K110

Roundtable

Educational Policy and Systems, Lifelong Learning

RT: Learning and Professional Development

Keywords: Case studies, Cooperative / collaborative learning, Educational policy, Interdisciplinary, Lifelong learning, Literacy, Motivation, Professions and applied sciences, School effectiveness, Teacher Professional Development, Workplace learning

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Hua Loon Ling, The University of Hong Kong, Hong Kong

Designing a professional development programme on reading for beginning teachers

Keywords: Cooperative / collaborative learning, Literacy, Motivation, Teacher Professional Development

Presenting Author: Iris Vansteelandt, AP University College/Ghent University, Belgium; **Co-Author:** Hilde Van Keer, Ghent University, Belgium; **Co-Author:** Suzanne E. Mol, Leiden University, Netherlands

As reading is one of the most important skills in education that contributes to students' school success, this study focuses

on teachers' continuous professional development (CPD) on reading and reading promotion, hereby aiming at fostering students' autonomous reading motivation. Since the first years of teaching are determining for teachers' future career path, the present study focuses particularly on beginning teachers (BT). The present proposal is part of a quasi-experimental intervention study, studying the effectiveness of CPD for teachers and their students. The presentation will particularly zoom in on design principles for and the development of the CPD programme combining Desimone's framework for effective professional development (2009) with Self-Determination Theory (SDT) as fostering motivation is aimed at.

Training Reactions as Predictors of Autonomous and Controlled Motivation to Transfer

Keywords: Motivation, Professions and applied sciences, Workplace learning, Lifelong learning

Presenting Author: Andreas Gegenfurtner, Technische Hochschule Deggendorf, Germany; **Co-Author:** Karina Fisch, Technische Hochschule Deggendorf, Germany; **Co-Author:** Martina Reitmaier, Technische Hochschule Deggendorf, Germany

Previous training research conceptualized motivation to transfer as a one-dimensional construct that varies in amount (high versus low motivation), not in kind (different qualities of transfer motivation). In recent years, research groups started to re-conceptualize motivation to transfer as a two-dimensional construct: autonomous and controlled motivation to transfer. To date, still little is known about the predictors of autonomous and controlled motivation to transfer. The present study addresses this gap and examines the relative importance of six training reaction scales in predicting transfer motivation. In addition, the study examines the moderating effect of age, gender, and work experience on the reaction—motivation relationships. The study sample consisted of 64 training participants. Analyses include exploratory factor analysis and multivariate regression. Analyses are ongoing. The outcomes of the study will be discussed in terms of their significance for theory development and their practical implications for training evaluation.

Strengthening school resilience against corruption through integrity standards and involvement

Keywords: Case studies, Educational policy, Interdisciplinary, School effectiveness

Presenting Author: Mihaylo Milovanovitch, Center for Applied Policy, Austria; **Co-Author:** Tinde Kovac Cerovic, University of Belgrade, Hungary; **Co-Author:** Kate Lapham, Open Society Foundations, United States

The roundtable will offer insight into an evolving methodology for assessing integrity of the education systems and present findings gathered from four countries by now. The approach is rooted in the conceptual traditions of rational choice and crime opportunity theories, and of root cause analysis. The evidence collected in the course of research shows between-country similarities in the types, descriptions and underlying policy shortcomings of malpractice (integrity violations), despite the fact that the researched countries are different geographically, historically and regarding the structure of their education systems. The roundtable will provide a possibility to exchange hands-on experience from the audience, and finish with an overview of common integrity characteristics and how they interact with equity and quality of education.

Session I 11

31 August 2017 12:00 - 13:30

Main Building E - E301

Poster Presentation

Learning and Instructional Technology, Lifelong Learning, Teaching and Teacher Education

PO: Professional Development and Lifelong Learning

Keywords: Arts, Assessment methods and tools, Attitudes and beliefs, Case studies, Comparative studies, Design based research, E-learning / Online learning, Educational Psychology, Educational Technology, Higher education, Interdisciplinary, Lifelong learning, Pre-service teacher education, Professions and applied sciences, Student learning, Survey Research, Teacher Professional Development, Video analysis, Vocational education

Interest group: SIG 14 - Learning and Professional Development

Chairperson: Telle Hailikari, University of Helsinki, Finland

Comparison of Finnish and German teacher students' motivations for choosing teaching career

Keywords: Comparative studies, Higher education, Pre-service teacher education, Teacher Professional Development

Presenting Author: Christian Harteis, University of Paderborn, Germany; **Co-Author:** Jani Ursin, University of Jyväskylä, Finland; **Co-Author:** Katja Vähäsantanen, University of Jyväskylä, Finland; **Co-Author:** Michael Goller, University of Paderborn, Germany; **Co-Author:** Dagmar Festner, University of Paderborn, Germany

The entrance into teacher education programmes differs widely between Finland and Germany. Whereas Finnish universities apply strong selection, the access to most German teacher education programmes does not bear any serious barriers. The aim of the study is to explore Finnish and German undergraduate students' motivations for choosing teaching as a career. A questionnaire including the internationally validated FIT-Choice Scale instrument will be distributed to undergraduate students in a Finnish university ($N = 210$) and in a German university ($N = 170$). Data analyses will comprise CFA to check the translated instrument and ANOVAs (or non-parametric equivalents) to test the differences between Finland and Germany. The expected findings of the study will reveal if the differences in the access to teacher education programmes between these countries are congruent with differences in the motivations to become a teacher. As for educational significance, the study is to provide new information to support policy making in both target countries and

also universities' informed decision making regarding teacher training. A theoretical contribution of the study is that it will further validate the FIT-Choice instrument in a new country (Finland) from a comparative perspective.

Career guidance of students in secondary vocational education for life long learning

Keywords: Student learning, Survey Research, Vocational education, Lifelong learning

Presenting Author:Marinka Kuijpers, The Hague University of Applied Sciences, Netherlands

In order to deal with the effects of the changing demands on the labour market and emergence of an unpredictable career, individuals are expected to develop career competencies. Career competencies are developed in a learning environment that stimulates real-life experiences with work and a dialogue about these experiences. A professionalization program for teachers was developed aiming to help them to conduct a career dialogue. The development of the program was accompanied by research. We present results of research among 786 students on the research question: What is the change in career guidance conversation according to the students after professionalizing compared to the conversations before professionalization and what is the relation between career guidance by teachers and the development of career competencies in students? The results show that the guidance conversations after professionalization are in form and content more career related and that student developed various career competencies.

Computationally Enhanced Simulators of Professional Practice to Improve Proportional-Reasoning

Keywords: Design based research, Educational Technology, Higher education, Professions and applied sciences

Presenting Author:Ilana Dubovi, University of Haifa, Israel; **Co-Author:**Sharona T. Levy, University of Haifa, Faculty of Education, Israel; **Co-Author:**Efrat Dagan, University of Haifa, Israel

Proportion reasoning, which forms the basis for medication calculation, is vital for high quality care and patient safety. Therefore, we have designed Situated Medication Mathematics (siMMath) environment which support the learning of proportional reasoning through successively digital simulations- digitally simulated nursing objects and ratio-table. The study was a quasi-experimental controlled pre-test-intervention-post-test-design. Participants were nursing students (N=168): 72 students in comparison group who learned with a lecture based approach and 96 in experimental group who learned with siMMath environment. Main findings reveal that learning with siMMath is most efficient in understanding of intensive quantities – concentration and drip-rate, which demands formal operations, a multiplicative thinking. Moreover, we have shown that through situated simulations the abstract proportional reasoning can be enhanced.

Paramedics' technical/non-technical skills and the role of knowledge, self-assessment and attitude

Keywords: Assessment methods and tools, Attitudes and beliefs, Interdisciplinary, Video analysis

Presenting Author:Michael Scheumann, University of Regensburg, Germany; **Co-Author:**Helen Jossberger, University of Regensburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany; **Co-Author:**Bernhard Graf, University Hospital Regensburg, Germany; **Co-Author:**York Zausig, University Hospital Regensburg, Germany

High quality cardiopulmonary resuscitation (CPR) is a key factor in improving cardiac arrest survival. Technical skills (TS; e.g. chest compression) and non-technical skills (NTS; e.g. team work) play a crucial role for patient's safety and care. The aim of the present study was to investigate TS and NTS of paramedics' CPR performance. 22 paramedics participated. Their CPR performance using a simulation mannequin was video-taped to analyse TS and NTS. In addition, prior knowledge, self-assessment and attitude regarding the role of NTS during CPR performance were assessed with a questionnaire. Data collection will be completed in January 2017. We expect that poor self-assessment leads to weaker CPR performance. A positive attitude towards NTS as well as prior knowledge about the importance of NTS is expected to lead to superior NTS performance. Poor NTS performance is expected to correlate with weak technical performance. The results of this study shed light on how technical and non-technical factors influence CPR performance. This research plays a role in the advancement of public good as it helps us to identify weaknesses in CPR that can be diminished in training.

How HE educators learn to teach Massive Open Online Courses. A case study

Keywords: Case studies, E-learning / Online learning, Teacher Professional Development, Lifelong learning

Presenting Author:Tina Papathoma, Open University, United Kingdom; **Co-Author:**Allison Littlejohn, Open University, United Kingdom; **Co-Author:**Rebecca Ferguson, The Open University, United Kingdom, United Kingdom

People working within HE institutions need to learn new forms of teaching and learning practice, to transform the ways they work. This study explores the types of knowledge gained by those working in HE when they teach massive open online courses (MOOCs). Data were gathered through a case study involving interviews with six people with teaching roles on one MOOC. Data analysis used Tynjälä's model of integrative pedagogy to identify the different types of theoretical, practical, sociocultural and self-regulative knowledge needed in order to teach in a MOOC. The analysis shows that individuals did not engage in formal training (theoretical knowledge); they learned by experience; by (re-)running the MOOC and from learners' feedback (practical knowledge). They also reflected on their learning experience, on their contact with different cultures, on engaging with ideas from other MOOCs and people (self-regulative knowledge). They worked collaboratively, sharing expertise, but sometimes found communication with colleagues was difficult (sociocultural knowledge). When they faced challenges they integrated theoretical, practical and self-regulative knowledge to solve problems (mediating processes).

Professional Development in Sculpting: Analysis of Social Interactions and Activities

Keywords: Arts, Educational Psychology, Professions and applied sciences, Lifelong learning

Presenting Author:Helen Jossberger, University of Regensburg, Germany; **Co-Author:**Linda Puppe, Universität Regensburg, Germany; **Co-Author:**Birgit Eiglsperger, University of Regensburg, Germany; **Co-Author:**Hans Gruber, University of Regensburg, Germany

The myth of the artist as a gifted genius goes way back and is still present today. Talent looms large in visual arts. Our theoretical starting point, however, is expertise research, in which talent plays hardly any significant role. Expertise is explained as the result of a long-term endeavour to advance accomplishments. The aim of the present study was to identify factors relevant for professional development in the domain of sculpting. 29 experts (sculptors with at least ten years of experience) and 24 semi-experts (university or academy students) participated in our survey study. A questionnaire was developed to examine the role of social interactions, artistic activities, and deliberate practice. The results reveal that colleagues were the most helpful persons for experts' professional development, while semi-experts identified classmates as the most important persons. Feedback about content specific elements related to their artworks was essential for experts' and semi-experts' professional development. Artistic activity was more individualistic for experts, while students emphasised the importance of collaborative work and exchange. The majority of participants tried to improve their skills continuously and they indicated to practice deliberately. The results shed light on professional development of artists and help us to better understand what factors are perceived to be relevant to advance. This knowledge is important to improve teaching in the domain of sculpting at academies and universities.

Session I 12

31 August 2017 12:00 - 13:30

Pinni A - A3103

ICT Demonstration

Learning and Instructional Technology

Get undergraduates off Facebook and into learning with game-based student response systems

Keywords: Assessment methods and tools, Educational Technology, Game-based learning, Higher education

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Eero Ropo, University of Tampere, Finland

In accordance with digital game-based learning principles, Game-based Student Response Systems (GSRS) can temporarily turn the classroom into a gameshow as they allow learners to use their mobile devices to individually answer questions, typically in multiple choice format, that are projected on a big screen. Learners' answers are collected automatically and are presented anonymously in the form of a histogram, after each question is answered. Incorporating GSRSs in education is potentially useful in instruction and learning because these tools have the potential to engage learners, and support both student learning and formative assessment. The first part of the ICT demonstration will focus on a specific GSRS, called Kahoot!, and will engage participants in playing a given game, taking the role of students, using their mobile devices. The second part will familiarize participants with the tool through step-by-step instructions on how they can create, edit, preview and test their own Kahoot! for any educational level. The third part will present findings from a study that assessed 33 undergraduate students' perceptions for the impact of the game-based response system on their engagement and learning. The fourth part will engage participants in a discussion on their experiences with similar tools or different tools for the same purpose to reflect on the tool's affordances and limitations for instruction and learning.

Workshop

Assuring assessment quality in higher professional education. Towards a successful strategy

Keywords: Assessment methods and tools, Educational policy, Higher education, Professions and applied sciences

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Thomas Martens, Medical School Hamburg, Germany

The quality of assessment is an important theme in higher professional education. To assure this quality, it is advisable to provide institutions with quality criteria and guidelines which support institutions in (re)writing a decentralized assessment plan. Until 2014, Zuyd University of Applied Sciences did not have a central vision on assessment. It was decided to formulate a first draft of this vision and corresponding guidelines which were validated by several important stakeholders: boards of examiners, teachers, assessment experts and peers. In total 15 guidelines were formulated: five guidelines on the scientific quality of assessment, five on the organizational quality and five on assessment literacy. Aim of the validation study was to investigate whether the defined guidelines were understandable, complete and usable. The feedback we received was immense. In total 856 comments were collected, analysed, clustered, and used for reformulating the guidelines. During the workshop participants are invited to discuss the assessment policy of Zuyd University. Our practice-based research study confirms that the implementation process of the central guidelines is very complex and unpredictable. In the workshop, we would like to discuss the implementation strategies. It aims to examine effective methods en strategies to implement a sustainable assessment policy in higher education. We hope that this contribution inspires other universities or educational institutions to validate central policy documents before implementing these within specific educational contexts.

ICT Demonstration

Assessment and Evaluation

How to implement the observation strategies to raise the Quality of Early Childhood Education (ECEC)

Keywords: Assessment methods and tools, Cognitive development, Early childhood education, Social development

Interest group: SIG 05 - Learning and Development in Early Childhood

Chairperson: Robert Kordts-Freudinger, Paderborn University, Germany

Valid feedback is essential for the administrators, educators, parents and, of course, for children to be able to steer their development in a sustainable way. Key influential theorists such as Montessori, Piaget, Vygotsky, and others all used observations extensively to understand how children learn and use knowledge about children's learning to improve pedagogies and children's lives. However, most adults including teachers in the ECEC settings have not always observed children and tracked their growth. Based on the research and professional development programs conducted in Finland, Taiwan and Hong Kong with more than 100,000 observations, we found some relationships between young children's involvement, adaptation and agency in early childhood settings through systematic observations. We will introduce observation strategies with video clips and demonstrate our latest mobile application for observation for practitioners to contribute to a big data pool aimed to enhance the teaching quality in ECEC settings.

Higher Education

Detection, coordination and reporting of individual student competency development with myCompetence

Keywords: Assessment methods and tools, Competencies, Goal orientation, Higher education

Interest group: SIG 04 - Higher Education

Chairperson: Angelica Moè, University of Padova, Italy

Program objectives are the key element of quality assurance measures at curriculum level as well as of the teaching and learning contract that exists between students and lecturers. Systematic measuring of how students meet the program objectives, as well as related feedback, are essential in promoting reflection on learning processes by (and between) students and instructors. On the other hand, such an assessment system, in particular where it concerns transferable skills, places high demands on an educational organization and its (technical) infrastructure.

The tool myCompetence was designed as a comprehensive quality development tool not only to facilitate the development of academic programs by heads of degree programs, module coordinators and lecturers, but also to encourage learners in making the best use of their learning environment and help them make the most of their learning processes.

myCompetence has three main functions: It coordinates the allocation of 'assessment events' between modules and actors (*coordinating function*), it records individual forms of competency (*measuring function*) and it provides the actors, especially learners, with valuable feedback on their skills development throughout the course of a program (*feedback and reporting function*). It can be used not only by the heads of study programs, module coordinators and lecturers to develop academic programs but can also help learners to fully exploit their learning environment and make the most of their learning processes.

Workshop

Higher Education

Teachers' Perceptions on Assessment in Higher Professional Education.

Keywords: Assessment methods and tools, Attitudes and beliefs, Competencies, Higher education

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Joana Pipa, University of Lisbon, Portugal

This workshop will present and enable participants to engage with research. The research focusses on teachers' perceptions on assessing the development that students make in Higher Education on their path to becoming junior professionals integrating 21st century skills. The research was carried out through the use of a questionnaire. Since assessment steers students' professional learning, it is important to design quality assessments that are well-aligned with professional goals. If this is not the case, the form of the assessment itself generally dominates and can lead to undesirable learning strategies on the part of students. This however imposes high demands on the assessment-literacy of teachers. They are responsible for the design of assessment methods that measure professional learning. The aim of this workshop is twofold; Firstly to present a study on the perceptions of Higher Education teachers regarding professional assessment. For this purpose, a questionnaire was developed. The study revealed that teachers need to develop their skills regarding new assessment methods. The second goal of this workshop is to discuss some content of the questionnaire for validity purposes in small groups. The workshop will end with recommendations on how the questionnaire may help teacher teams within their organizations when setting up a professional development plan.

ICT Demonstration

Learning and Instructional Technology

Recording, visualising and analysing web based learning processes with the ScreenAlytics software

Keywords: Assessment methods and tools, Learning analytics, Psychometrics, Video analysis

Interest group: SIG 27 - Online Measures of Learning Processes

Chairperson: Triinu Kärbla, University of Tartu, Estonia

Research on learning needs to investigate not only the outcomes of learning but especially the learning processes in order to gain insights into underlying mechanisms and promote the construction and verification of theories of learning. Meaningful data that describes this learning process is an indispensable prerequisite to do so. One reasonable way to get process data in web based learning environments is recording the screens of the learners and analyse it regarding behaviour and events that the researcher is interested in. Commonly used software packages like Camtasia record the learners' screens as pixel based videos (e.g. mov, mpeg). A huge disadvantage of this approach is that we lose meaningful information by translating actually inherent events to pixels. In consequence, extensive manual coding is needed make that pixel data meaningful again (e.g. did a learner use a specific instructional support system?).

Instead of recording pixels, we propose to record time-stamped event information (mouse clicks and movements, scrolling, keystrokes, etc.) that reflects the entire observable interaction between the learner and the learning environment. This leads to a quantitative representation of the interaction that can either be simulated in order to get a video-like replay, or can be subject to a variety of other visualisations (e.g. heatmaps) and statistical analysis (e.g. machine-learning algorithms). We developed a software called "ScreenAlytics" that can be used to easily record, visualise and export this data in web-based learning environments. This demonstration introduces the approach, explains the software and give examples of possible applications.

Smart Learning Paths - Using Artificial Intelligence To Provide Individual Support in eLearning

Keywords: Computer-assisted learning, E-learning / Online learning, Informal learning, Learning analytics

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Jingjing Sun, University of Montana, United States

Supporting the learning process with machine learning and artificial intelligence represents the next phase of online learning. A learning environment, which adapts to the needs of the learner is be able to offer individualised scaffolding for every learner. This may help solve problems of drop-out rates and loss of motivation, which disturb learners in many online courses.

This ICT demonstration will introduce the participants to using a personal learning environment, which applies learning analytics and artificial intelligence to give personalized suggestions for each learner. The demonstration will walk the participants through a session in which they get acquainted with how an intelligent learning environment may help the teacher and learners in online learning settings. Participants will get familiar with learning paths, automatically created quizzes and learning analytics. After this demonstration the participants will be able to understand how the current level of development in artificial intelligence may be used to support learning and instruction.

The demonstration will be done in CLANED (<http://app.claned.com>) learning environment, which aids students to set, evaluate and achieve their learning goals. Support is given in the form of recommended activities that form a learner's learning path to her goal. Natural language processing is used to provide automatically created quizzes from text materials, and to provide analytics about learning. The user is thus given personalized feedback and recommendations how to adjust studying according to individual progress.

Teaching and Teacher Education

The British Education Research Tool (BERTiE)

Keywords: Educational Technology, Teacher Effectiveness, Teacher Professional Development, Technology

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Gabriela González Ocampo, Ramon Llull University, Spain

The British Education Research Tool (BERTiE) is being developed by the Bath Spa Institute for Education in light of government priorities regarding professional development identified in both the DfE consultation '*A World Class Teaching Profession*' (2015) and the English education white paper '*Educational Excellence Everywhere*' (2016). We have responded to this call to support teachers' practice and enhance their knowledge by building this online platform which allows easy access to evidence-based education research and facilitates opportunities for knowledge transfer afforded by online and mobile technologies. BERTiE is a web-crawler that only searches pre-defined websites which have been curated through academic moderation. Current and future Teachers will benefit from searching education research, policy and comment while being confident that their results have assured academic rigour guaranteed through the curation process. The Institute for Education is deploying BERTiE during 2016/17 as a research tool for trainee teachers to enrich their experience and embed research in their work across schools, colleges and universities. In this demonstration, we will explore how BERTiE works and could evolve further to support teachers in the field and enhance wider teaching and learning. We will also discuss to what extent government policy in England - which suggests the need for such a tool - correlates to the wider international political context, as well as to what extent BERTiE might be an applicable tool for educators on a global scale. Participants will be able to view and engage with BERTiE and engage in discussion of its potential future applications.

Workshop

Teaching and Teacher Education

Exploring, catching & creating: Making language awareness visible with linguistic reasoning

Keywords: Language (Foreign and second), Language (L1/Standard Language), Reasoning, Teaching approaches

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Christian Brandmo, University of Oslo, Norway

Higher-order thinking has become a fundamental skill in education. The challenge for teachers is to develop teaching materials that stimulate students' higher-order thinking skills and, for language teachers in particular, that stimulate students to think and reason about language more consciously and creatively. This workshop is intended to introduce the concepts of language awareness and linguistic reasoning in the context of language teaching. In order to facilitate the development of higher-order learning materials within the language subjects, we developed a framework that will make language awareness visible with linguistic reasoning. In doing so, we strive for enrichment of the subject matter content and provide tools to support teachers in the development and assessment of higher-order thinking exercises. The aim of this workshop is to present a research-based approach for integrating and stimulating higher-order thinking skills within the language subjects in secondary school. Through a combination of hands-on group activities with innovative materials and discussion, workshop participants will develop a more in-depth insight into the above-mentioned concepts and gain practical knowledge on how to use the framework in order to stimulate higher-order thinking in the language classroom. This workshop draws on findings resulting from L1/L2 teachers' experiences in a professional learning community (PLC). In this PLC teachers developed, tested and evaluated a pedagogy for language education based on the framework. In this workshop we will also discuss students' learning outcomes with the use of an assessment tool.

Workshop

Teaching and Teacher Education

Lesson Study as a Tool to Strengthen Teachers' Competencies as a Learning Professional

Keywords: Collaborative Learning, Secondary education, Teacher Professional Development, Teaching / instruction

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Josepa Alemany-Costa, Spain

Lesson study is a collaboration-based teacher professional development approach that originated in Japan. Teachers collaboratively engage in research inside their classrooms using a design cycle: prepare and design lessons, perform the designed lesson *live* as a research lesson and evaluate them in order to feed into the next cycle. Great thought is devoted to predicting how the students may react based on the teaching behavior of the teacher. What sets Lesson Study apart from other professional development methods is the *live* research lesson, creating a unique learning opportunity for teachers. Lesson Study has hardly been explored on its effectiveness for teachers' professional development; effects are mostly reported based on self-reports. In this workshop the aim is to familiarize participants with the nuts and bolts of Lesson Study and how teachers' professional development is enhanced by use of Lesson Study. We will brief participants with a Lesson Study plan for a mathematics lesson. Participants will then be split up into the teachers who will be observing the *live* research lesson and into students to whom the *live* research lesson will be taught. The research lesson is given by a mathematics teacher. After this the post-lesson discussion is done, in which the participants who have observed in their teachers role share their experiences. The workshop ends with a reflection of all participants on their experiences. In the discussion, we will also go into the various contextual factors critical if Lesson Study is to become a sustained commitment in schools.

Lesson Study as a Tool to Strengthen Teachers' Competencies as a Learning Professional

Session I 22

31 August 2017 12:00 - 13:30

Main Building C - C7

Workshop

Mixed methods in educational research

Keywords: Doctoral education, Mixed-method research, Qualitative methods, Quantitative methods

Interest group: SIG 17 - Methods in Learning Research

Chairperson: Mirjamaija Mikkila-Erdmann, University of Turku, Finland

In the workshop, participants learn how to build their own mixed methods designs for educational research. A mixed methods design is a design for a study that involves the integration of data from several sources. Examples include the integration of data obtained through different methods, or the integration of answers to separate, but related research questions. We will start by examining some real-life examples from the participants' research practice, and next discuss characteristics, opportunities and pitfalls of mixed methods research in education. Participants will apply a strategy for the design of mixed methods research, developed by the workshop leader, to examples from their own research practice. This strategy involves various specific purposes of mixing, each related to a specific stage in the research process, and classified into three overall purposes of mixing; a distinction between a point of extension and a point of integration; and a method of visualizing cases of mixing.

Workshop

Causal Inference in Educational Research: A discussion about Statistical Methods

Keywords: Design based research, Experimental studies, Quantitative methods, Quasi-experimental research

Interest group: SIG 18 - Educational Effectiveness

Chairperson: Martijn Meeter, VU University Amsterdam, Netherlands

Causal questions in education are extremely relevant. This kind of questions appears, for example, when we want to know what is the effect of a specific type of instruction or educational program. The gold standard to make causal inference are

randomized studies, but in many situations, for ethical or feasibility issues, it is not possible to do it. Quasi-experimental research allows us to overcome this limitation, through the use of statistical methods to control for confounding variables. In this workshop, we will analyze three techniques used in this framework: propensity score analysis, regression analysis and doubly robust estimation. Its advantages, differences and limitations will be discussed with real educational data examples in R and in SPSS.

ICT Demonstration

Increasing Equity and Challenging Disadvantage

Keywords: Computer-assisted learning, Learning Technologies, Mathematics, Multimedia learning

Interest group: SIG 07 - Learning and Instruction with Computers

Chairperson: Michael Besser, Leuphana University of Lüneburg, Germany

Equity in learning at school in Luxembourg is heavily influenced by the country's multilingual tradition where two-thirds of students enrolling in schools at age four are more likely to struggle in learning, as they do not master any of the three languages actively used for instruction during compulsory education. In this session, participants will use their own mobile device or watch the demonstration to gain hands-on experience of exploring MathemaTIC, an innovative adaptive digital environment to enhance the learning of mathematics in a fairer manner. Created through a collaboration of expertise between Luxembourgish, French and Canadian practitioners, research, pedagogy and technology specialists, MathemaTIC enables primary school students to learn mathematics in German, French, Portuguese or English. Participants will try out the multilingual interactive, visual, audio and video mathematical items and receive real-time feedback on their progress and achievement of the modules. Their experience will feed into a discussion about the benefits of this digital environment in tackling inequity and disadvantages in learning, in particular to exchange views on the extent to which the multilingual items in this adaptive environment have so far served to directly motivate both students and teachers to view mathematic learning from another perspective and increase their chances of success.

Interactive Feedback about Instructional Quality: Easy Distribution and Usage Tracking

Keywords: Design based research, Educational Technology, In-service teacher education, Teacher Professional Development

Interest group:

Chairperson: David Galbraith, University of Southampton, United Kingdom

All over the world and every day researchers, school inspectors, principals and teachers themselves generate qualitative and quantitative data describing instructional quality. Although feeding back this information is valuable for school and teaching development, systematic implementation of instructional quality feedback is scarce in some countries and researchers are sceptical about the understanding and the usage of feedback through teachers. In our ICT-demonstration we want to show, that the “shiny” web application framework for R is a ideally suited tool to overcome both problems, hence it uses the widespread statistical language R to generate rich and powerful interactive web applications with no knowledge of HTML, CSS or JavaScript. So teachers can explore their feedback interactively by generating different plots of numerical data or displays of free text answers, whereby researchers can investigate the usage of this feedback applications via log data. Results of a design based research study with the shiny framework will be outlined.

Assessment and Evaluation

Changing Competence Needs and International Comparative Assessments

Keywords: Educational attainment, Educational policy, Secondary education, Survey Research

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Erno Lehtinen, University of Turku, Finland

Economic development presupposes high-quality education. Education makes it possible for individuals to find their place in the labour market and provides skills transferable to the rapidly changing needs of working life. Education also generates industrial and economic innovations. These two functions of education have been boosted by increasing international competition and automatization, which has largely replaced low-education jobs. However, the strengthening link between education and economy may pose a threat to the independence of the institution of education. Education is a value per se which does not need to be justified by economic gain or social equality. Essentially, education is about civilizing individuals and nations. When succesful in this, education also adds value to the other sectors of society, thereby contributing to overall well-being. In several countries, the current debate on education is dominated by the requirement for increased productivity and effectiveness. Education is expected to yield competences that are directly transferable to the needs of the labour market. Young people likewise appreciate the immediate benefits of education. At the same time, the civilizing function of education has been largely ignored. The threat is that schools produce competent and skilled people with, however, increasingly limited ability to understand other humans and their own humanity. International comparative assessments of educational achievement have attracted wide public interest. Primarily, the interest of both politicians and the media has lied in how countries have ranked in these assessments, whereas little attention has been paid to the reasons behind these rankings. The purpose of this presentation is to show, with the help of examples, how, for instance, PISA data can be used to analyze special characteristics of educational systems. Results of comparative assessments can be used to give political and pedagogical recommendations on how to implement long-term educational renovations. In the end, these results need to be interpreted within the cultural and historical context of each country.

Teaching and Teacher Education

Moving Beyond Rhetoric: a Culture to Substantiate Research Based Teacher Education

Keywords: Action research, Professions and applied sciences, Researcher education, Teacher Professional Development

Interest group: SIG 11 - Teaching and Teacher Education

Chairperson: Marita Mäkinen, University of Tampere, Finland

European, as well as national steering documents, including Norwegian (Østern & Smith, 2012; Østern, 2016) call for a research based teacher education. Finland is, perhaps, the country that has most profoundly substantiated the concept (Niemi, Toom & Kallioniemi, 2012; Niemi & Nevgi, 2014; Hökkä & Eteläpelto, 2014; Sahlberg, 2014; Krokfors et al, 2015). It is, however, not always clear what is meant by a research based teacher education, or what the policy makers' intentions are when writing the documents. The danger is that the message rests in the rhetoric and is not being subjected to a profound analysis of the notion prior to being translated into practice.

In this presentation I will first argue that teacher education is a career long education, and it is time to move beyond the idea that teacher education is a synonym with initial teacher preparation for the profession. This view aligns with European documents (OECD, 2010; The Teaching Council, Ireland, 2011). Next I will explore who the teacher educators are, especially since in many contexts the practical component of initial teacher education is extended and school-based teacher educators play an increasingly important role in preparing new members of the teaching profession.

Against this backdrop, the main part of the presentation discusses the concepts of research-based teacher education, with a focus on consuming and producing research as an integrated part of a career-long teacher education. There is a need to go beyond the rhetoric and create a culture for research in teacher education at a national and at an institutional level by empowering all actors, teacher educators as well as students of teaching, to become research literate. I will also argue that practitioner research plays a central role in a research based teacher education and discuss the difficulties in legitimising this kind of research in the academic community. There are still several challenges to substantiate a research based teacher education that needs to be further explored in policy discussions as well as in research.

Learning and Social Interaction

Promoting Adaptive Regulation: Progress, Challenges and Possibilities

Keywords: Collaborative Learning, Metacognition, Self-regulation, Social aspects of learning and teaching

Interest group: SIG 16 - Metacognition

Chairperson: Sanna Järvelä, University of Oulu, Finland

In the late 1990s and early 21st century, a handful of scholars began to define and explore three social forms of regulation including self-regulation, co-regulation and shared regulation.

Since that time, the field has rapidly burgeoned. This presentation will ground theory and research about social modes of regulation in their theoretical roots within educational psychology and the learning sciences identifying critical constructs underlying our perspectives. Winne & Hadwin's (1998) COPES model of self-regulated learning will be extended to explain adaptive regulation in collaboration. Finally a decade of research will be summarized to illuminate progress, challenges and possibilities facing the field as we strive to model, research, and apply adaptive regulation in the context of dynamic collaborative learning contexts.

Promoting Adaptive Regulation: Progress, Challenges and Possibilities

Assessment and Evaluation

Assessment Methods and Tools

Keywords: Assessment methods and tools, Competencies, Comprehension of text and graphics, Educational Technology, Higher education, Primary education, Professions and applied sciences, Reading comprehension, Reflection, Student learning

Interest group: SIG 01 - Assessment and Evaluation

Chairperson: Marij Veldman, University of Groningen, Netherlands

Toward a better judgment of item relevance in progress testing.

Keywords: Assessment methods and tools, Higher education, Professions and applied sciences, Student learning

Presenting Author: Xandra Janssen-Brandt, Zuyd University of Applied Sciences, Netherlands; **Co-Author:** Dominique Sluijsmans, Zuyd University of Applied Sciences, Netherlands; **Co-Author:** Arno Muijtjens, Maastricht University, Netherlands

Items must be relevant to ensure item quality and test validity. As 'item relevance' is not operationalized yet, it is difficult to reach consensus agreement on it. A rubric was developed to help define item relevance. This study explores the influence of this rubric on the assessment of item relevance and on inter-rater agreement in particular. Members of the item review committee (RC) and students, teachers, and alumni (STA) reassessed the relevance of 50 previously used progress test (PT) items and decided about their inclusion using a 5-criteria rubric. Data were analyzed at item level using paired samples t-tests and Intraclass Correlation Coefficients (ICC) and at rater level in a generalizability (G) analysis per group. The proportion of items that the RC judged relevant enough to be included decreased substantially from 1.00 to 0.72 ($p < 0.001$). Agreement between the RC and STA was high, with an ICC of >0.7 across items. To achieve an acceptable inter-

rater reliability for relevance and inclusion, 6 members must serve on the RC. Use of the rubric results in a stricter evaluation of items' appropriateness for inclusion in the PT and facilitates agreement between the RC and other stakeholders. Hence, it may help increase the acceptability and validity of the PT.

Evaluating the Alignment of Examinations: The Student Perspective

Keywords: Assessment methods and tools, Educational Technology, Higher education, Student learning

Presenting Author: Tobias Halbherr, Swiss Federal Institute of Technology Zurich / ETH Zurich, Switzerland

Constructive alignment is a widely accepted good-practice framework that emphasizes the importance of examinations in teaching and learning. This study analyses data from over 34'000 examination evaluation questionnaires from more than 900 paper- and computer-based, for-credit examinations at a large European STEM university. Data was collected as part of the regular Student Evaluation of Teaching in the academic year 2015/2016. The questionnaire consists of 20 five point Likert-items. The Likert items are designed to assess student appraisals of alignment of teaching and examination, and other constructs such as test fairness, depth of learning approach, appropriate amount of time provided, expected grade, or overall satisfaction with the examination. In this study the collected student evaluation data is analysed to assess the relevance of alignment with regards to examination quality and student learning from the students point of view.

Development of rubrics to assess the reflective thinking of university students

Keywords: Assessment methods and tools, Competencies, Higher education, Reflection

Presenting Author: Patrick Lai, Hong Kong Polytechnic University, Hong Kong

Case-based learning packages were developed to raise awareness of first year university students of the need to develop generic attributes for their profession during their course of study. In order to assess the learning impact of these case-based packages on their learning, students were asked to write reflective journals to document their learning experiences. Rubrics were established to assess the degree of their reflection. Sample reflective journals completed by 41 university students who had previously worked through the packages in 4 academic departments were used as a basis for establishing the standards for the rubric. Extracts of students' reflective journals were used as illustration of each of the category in the rubric. The four-category scheme of non-reflection, understanding, reflection and critical reflection (Kember *et al.*, 2008) would be used as the foundation for developing the categories of the rubrics. The originality of this paper attempted to extend the assessment literature of generic attributes by developing rubrics to assess the reflective thinking of students having gone through case-based learning packages.

Analysis of the Comprehension Tasks of National Standardised Tests of Estonian Language

Keywords: Assessment methods and tools, Comprehension of text and graphics, Primary education, Reading comprehension

Presenting Author: Triinu Kärbla, University of Tartu, Estonia; **Co-Author:** Krista Uibu, University of Tartu, Estonia; **Co-Author:** Mairi Männamaa, University of Tartu, Estonia

Text comprehension is a complex process where low- and high-level skills are likely to interact. In this article the comprehension tasks of national standardised tests of Estonian language for Grade 6 in 2013–2015 are analysed to detect levels of text comprehension in standardised tests. We found that the comprehension tasks in standardised tests are mostly focused on factual knowledge. Furthermore, 76% of questions in the National standardised test in 2014 and 57.1% in 2015 consisted of tasks which measured children's ability to recall the details from the read or heard text. In 2013, there were 42.8% of tasks like this in national standardised test. We found only one task (in year 2013) which demanded the highest skills – implementing pre-knowledge into evaluation process. Thus, the tasks used in standardised test are not enough wide-ranging to find out students' skills at different levels of text comprehension. As long as national standardised tests consist mostly of tasks that require readers' memory, teachers also concentrate mainly on supporting students' lower-level text comprehension skills. Therefore, promoting the students' high-level skills may be insufficient. On the other hand, text comprehension is one of the most important competences students must acquire for successful academic and lifelong growth.

Scaffolding elementary school students' collaborative learning on tablets

Keywords: Computer-supported collaborative learning, Learning Technologies, Mathematics, Primary education

Presenting Author:Lara Johanna Schmitt, Saarland University, Germany; **Co-Author:**Armin Weinberger, Saarland University, Germany

Multi-touch interfaces allow for direct and simultaneous input by several co-present learners. Additional scaffolding may or may not be needed to ease or problematize tasks that involve intuitive bodily experiences. In this study, a tablet app ("Proportion") is supposed to enable two novices (about 10 years old) to collaboratively construct an understanding of proportional relations. In a 2x2 factorial design ($n = 162$), effects of facilitating strategy prompts (with / without) and problematizing verbalization prompts (with / without) regarding the variables task focus, emotions, quality of dialogue and learning gains have been investigated. While the strategy prompts did not have any significant influence, the verbalization prompts had versatile effects: On one hand, quality of talk was improved, on the other hand, task focus and emotions were negatively affected. Learning gains were limited to near transfer task types and comparable over conditions.

Development of the Collaborative Skills Questionnaire (ColSQ) – first results of a pilot study

Keywords: Computer-supported collaborative learning, Problem solving, Social interaction, Survey Research

Presenting Author:Anita Pásztor-Kovács, University of Szeged Doctoral School of Education, Hungary; **Presenting Author:**Attila Pásztor, MTA-SZTE Research Group on the Development of Competencies, Hungary

The aim of this research is to develop a new instrument called Collaborative Skills Questionnaire (ColSQ) for the effective investigation of the social component of Collaborative Problem Solving (ColPS) on individual level. Herewithin, the results of a pilot study are presented. The paper and pencil questionnaire was administered to 96 pupils from four 8th grade (age 14) classes in classroom context. Based on the theoretical model of ColPS by Hesse et al. (2016) we created 3 subscales, Participation (Partsc), Perspective taking (Perspsc) and Social regulation (Socregsc) with 10, 6 and 17 items assigned to 10 subskills. Participants had to rate on a 5-point scale how well the 33 statements described them. After removing 4 items the reliability (Cronbach's alpha) indexes are .91 for the entire ColSQ, .83 for Partsc, .68 for Perspsc and .80 for Socregsc. Principal Component Analyses with Varimax rotation resulted in a 2-factor solution on Partsc in consistence with its 2 subskills (factor loadings \geq .68; total variance explained=65.89%). On Perspsc 2 factors clearly represent the 2 subskills (factor loadings \geq .67; total variance explained=60.00%). Socregsc items compose 3 factors (factor loadings \geq .69; total variance explained=66.01%), one is completely, another one is in 2/3 part determined by a subskill. ColSQ and its subscales proved to be reliable, the notable congruence between the factor structure and the theoretical model indicates a promising but currently moderate level of construct validity. Further research is necessary for its increase with the inclusion of a greater sample and the application of confirmatory factor analyses.

Critique is good. Suggesting corrections is better: Sharing Peer Ideas during Inquiry Learning

Keywords: Computer-supported collaborative learning, Educational Technology, Inquiry learning, Science education

Presenting Author:Astrid Wichmann, Ruhr University Bochum, Germany; **Co-Author:**Camillia Matuk, New York University, United States; **Co-Author:**Elissa Sato, University of California-Berkeley, United States; **Co-Author:**Libby Gerard, University of California-Berkeley, United States; **Co-Author:**Jacquie Madhok, University of California-Berkeley, United States; **Co-Author:**Marcia Linn, University of California-Berkeley, United States

In this study, we explored the value of critique to support students in distinguishing between normative and non-normative ideas about energy. In a Web-based Inquiry Science Environment (WISE, Linn & Eylon, 2011), we scaffolded students' idea generation and sharing. In total, 132 students from five middle school classes were randomly assigned to one of two conditions where students either chose ideas they disagreed with (Critique condition) or agreed with (Agree condition). Open and closed response pre- and posttest items, embedded items, as well as students' reflections were analyzed. Results showed that through choosing opposing ideas, students were encouraged to make suggestions for corrections, yet through agreeing with ideas students were not. Furthermore, findings suggest that critique affected knowledge gain positively but only if students made suggestions for corrections.

Examining and Developing Epistemic Cognition in Computer-Supported Collaborative Knowledge Building

Keywords: Communities of learners, Computer-supported collaborative learning, Conceptual change, Inquiry learning

Presenting Author:Carol Chan, The University of Hong Kong, Hong Kong; **Co-Author:**Ivan Lam, Open University of Hong Kong, Hong Kong

This study investigated the role of knowledge building and Knowledge Forum®, a computer-supported collaborative learning environment in fostering epistemic and conceptual change. Participants were eighty 10th grade students studying electro-chemistry in two Hong Kong classrooms. Supported by Knowledge Forum, students engaged in knowledge-building inquiry posting questions, co-constructing explanations and they wrote reflective knowledge-building portfolios tracing their own trajectory of conceptual change and collective growth. Two conditions were included, knowledge building (KB) and knowledge building with epistemic scaffolds (KBS). Data included epistemic-belief questionnaires; conceptual-change tests and knowledge-forum portfolio. Quantitative analysis indicate both knowledge-building classes improved on post-test conceptual and epistemic-belief measures with stronger effects in KBS class. Qualitative analysis of knowledge-building portfolios identified six epistemic cognition processes grouped as (a) epistemic aims and goals; (b) evaluation of knowledge claims; and (c) creation and development of ideas. Analysis of portfolios showed increases of epistemic cognition indicating

growth over time. Hierarchical regression analyses show that epistemic cognition scores predict post-test conceptual scores over and above pre-conceptual scores; similarly, epistemic cognition scores predict post-test epistemic-belief scores over and above pre-test epistemic-belief scores. Implications of examining epistemic cognition in situated context and role of knowledge-building environment in epistemic and conceptual change are discussed.

Surface and Deep Learning, Problematic Internet Use, and Fear of Missing Out (FoMO)

Keywords: Learning approaches, Mixed-method research, Motivation, Peer interaction

Presenting Author: Dorit Alt, Kinneret College on the Sea of Galilee, Israel; **Co-Author:** Meyran Boniel-Nissim, Kinneret College on the Sea of Galilee, Israel

Despite increased interest in and writing about FoMO, very little is empirically known about the phenomenon and its correlates in the context of learning approaches. This exploratory study was aimed at revealing possible links between adolescents' deep and surface approaches to learning, Fear of Missing Out (FoMO), and Problematic Internet Use (PIU). Given the exploratory nature of this study, two statistical techniques were used: Structural Equation Modeling (SEM) and Smallest Space Analysis (SSA). Data were gathered from 216 adolescents, by three questionnaires: the Fear of Missing Out scale (FoMOs), Short Problematic Internet Use Test (SPIUT), and Student Process Questionnaire (R-SPQ-2F). The SSA results yielded a *simplex* projection. The projection has confirmed the two-factorial theoretical structure of deep and surface learning. Additional information provided by the SSA projection was that both PIU and FoMO factors were located in the *surface learning* area. Based on this analysis and the theoretical framework, SEM was deployed to discover possible links between the research factors. According to the path model results, the FoMO variable had a moderating role, impacting the relationship between the PIU and surface learning variables. Limitations, conclusions, and directions for further research are discussed.

Individual and group-level affective aspects of small group work in high school science.

Keywords: Collaborative Learning, Emotion and affect, Science education, Motivation and emotion

Presenting Author: Martina Nieswandt, University of Massachusetts Amherst, United States; **Co-Author:** Elizabeth McEneaney, University of Massachusetts Amherst, United States

Small group work is a major instructional strategy in many learning contexts. Activities done in small groups, grounded in a constructivist view of learning, offer a common means of teaching, yet guidance for teachers about how best to guide small group work remains scant. For adolescents in particular, the affective dimension of small group dynamics may play a substantial role in learning outcomes, and our study investigates (i) what aspects of affect (interest, emotions) can be observed during small group work, and (ii) whether there is such thing as group-level affect. Results indicate activity-specific links between expressed emotions (excitement, disgust) and triggers of interest (novelty, personal relevance) on the individual and the group level. Expression of negative emotions didn't lead to lack of interest; they were associated with observing science instead of doing science. Collectively maintained interest rarely guided progress on science content raising the question about other factors necessary for science content development during small group work, e.g., social/relational competencies.

Emotion regulation in primary school children: A systematic review

Keywords: Developmental processes, Emotion and affect, Primary education, Social aspects of learning and teaching

Presenting Author: Juliane Schlesier, University of Oldenburg, Germany; **Co-Author:** Barbara Moschner, Carl von Ossietzky Universität Oldenburg, Germany; **Co-Author:** Ingo Roden, Carl von Ossietzky University Oldenburg, Germany

In the past years, numerous studies investigated the meaning of social environment (especially family and peers) for the development of emotion regulation, including the milestones of development, diverse strategies, and cognitive as well as affective components of emotion regulation. Nevertheless, the role of the primary school as an institution for the development of emotion regulation has been widely disregarded, although most recent research had an explicit school or classroom setting. The purpose of this study is to perform a systematic review to investigate the role the primary school in any emotion regulation processes. After particular scoping research all studies of the research field have been collected from 18 appropriate search databases as Web of Science, SocINDEX, JSTOR and ERIC, obtaining 3472 results. Furthermore, main scope was limited by in- and exclusion-criteria of a PICO-table (population, language, setting, topic,

study design and relevance) to a number of 21 relevant papers that had been published between 2011 and 2016. Findings show that the papers are classified in three different groups of study designs: long-term interventions, longitudinal studies without intervention and cross-sectional studies. Since the established programs as SEL or TFGA have larger, significant effects than widely unknown programs, it seems advisable to apply and refine established programs. Further results for the three different approaches will be presented at the conference.

The Interplay of Motivational Regulation and Social Support for Successful Academic Learning

Keywords: Higher education, Motivation, Self-regulation, Motivation and emotion

Presenting Author: Thomas Martens, Medical School Hamburg, Germany

This study invests the interplay of motivational regulation and social support for academic learning. Especially, social support is known as an important resource for coping with academic stress. So the key research question was: can academic motivation successfully be regulated without social support? As theoretical background for motivational regulation serves the Integrated Model of Learning and Action (IMLA) that defines three main phases of learning: the motivation phase, the intention phase and the volition phase. 257 students from two private universities in Germany were asked with an online questionnaire that covers most scales regarding the IMLA and an additional scale for social support. In a 2-step-analysis process based on IRT methods five typical motivational profiles can be identified: pragmatic, anxious, self-determined, negative and strategic. The social support scale was analysed with a latent class analysis and resulted in two profiles: low and high social support. Associating both results show that especially the very motivated students (self-determined) have high social support whereas the low motivated students (anxious and negative) have just low social support. It can be stated that successful motivational regulation is always accompanied by social support. Further studies have to prove if social support is always necessary or if motivational regulation also enables to find or recreate social support.

Practically Oriented Modelling and Validation of Competency Frameworks

Keywords: Competencies, Higher education, Professions and applied sciences, Qualitative methods

Presenting Author: Alexander Baumgartner, ZHAW School of Management and Law, Switzerland; **Co-Author:** Claude Müller Werder, ZHAW School of Management and Law, Switzerland

A competency framework is a matrix defining competency-oriented objectives for study programs. Simply put, it is designed to highlight what students are supposed to be able to do after they complete their studies. Competency frameworks form the basis for a differentiated assessment of students' professional, methodological, and social competence and self-competence, which in turn contributes towards the continuous improvement of study programs. Based on input from internal stakeholders (Center for Innovative Teaching and Learning: educational perspective, heads of degree programs: academic/university perspective) a specific target structure was designed for eight Bachelor's and eight Master's degree programs in the discipline Business Studies and geared towards "typical" future work scenarios of graduates. A total of 39 guided interviews were conducted to validate these documents from external stakeholders (employers: entrepreneurial perspective, graduates: student perspective), after the competency frameworks were refined and finalized.

Integrated authentic assessment design for motivation and quality learning

Keywords: Assessment methods and tools, Higher education, Motivation, Student learning

Presenting Author: Graham Hendry, University of Sydney, Australia; **Co-Author:** Elise Baker, The University of Sydney, Australia; **Co-Author:** Michael McDonnell, The University of Sydney, Australia

As teachers in higher education often the greatest challenge in our role is engaging our students. We want our students to be positively motivated to master the material of our disciplines and professions. However, despite several well-researched educational psychology theories of learners' motivational processes, recommendations for everyday practice in higher education are generally not well articulated. We already know for example that assessment 'drives learning', but this over-used phrase has almost lost its meaning, and some assessment may 'drive' students in the wrong direction. In this presentation we present evidence of the effectiveness of authentic assessment design for motivating students to achieve high quality, desirable learning outcomes. Authentic assessments are based on real-world professional scenarios and/or discipline practices. Students are engaged by such assessments because they perceive them as being relevant to the

study of a discipline and/or their future careers. We report learning outcomes data and the results of two qualitative case studies of authentic assessment design: from a Health Professional program and an Arts and Social Sciences program. We integrate theories of learners' motivational processes, including goal and self-determination theory, and the concepts of personal interest and self-efficacy to explain our results. By combining diverse theoretical perspectives with qualitative case data, we articulate key features of authentic assessment design. Faced with the challenge of motivating and engaging our students, we argue that by changing the design of assessment to make it more authentic, students' intrinsic motivation for learning is enhanced and quality learning outcomes are achieved.

Understanding the underpinnings of complex problem solving in a higher-education setting

Keywords: Artificial intelligence, Cognitive skills, Higher education, Problem solving

Presenting Author: Mariel Musso, CIIPME(CONICET)-UADE, Argentina; **Co-Author:** Pablo Gonzalez, UADE University, Argentina; **Co-Author:** Maida Mustafic, University of Luxembourg, Luxembourg; **Co-Author:** Samuel Greiff, University of Luxembourg, Luxembourg; **Co-Author:** Eduardo C. Cascallar, KU Leuven, United States

In recent years, educational and cognitive research has emphasized the importance of cross-curricular skills such as complex problem solving (CPS) not only for success in the learning process, but also for success in current modern societies requiring these complex skills. This study utilized a machine-learning approach to develop models predicting the performance of first-year university students in several dimensions of CPS, examining the contribution of complex interactions of working memory, attention, perseverance, openness and background. Once these models were established, accurately describing each of the performance groups in three aspects of CPS (exploration strategies, knowledge acquisition phase, and knowledge application phase), differences between low and high performers in these CPS phases were studied for several variables which have been shown to have important effects in performance: cognitive (working memory, executive attention, operations reaction time, executive attention reaction time), motivational and self-regulation (perseverance, openness, subjective competence, task attraction), and background variables (levels of education of mother and father, SES indicators, and others). Results indicate specific effects that show the pattern of mediation of these various variables on CPS and its three aspects considered in the study. The contribution of the findings relate to cognitive theory and to possible educational interventions that take into account individual differences in approaching complex problem situations.

21st Century Skills in the Higher Education Development Projects

Keywords: E-learning / Online learning, Educational Technology, Higher education, Teacher Professional Development

Presenting Author: Mikko Vesisenaho, University of Jyväskylä, Finland; **Co-Author:** Tuula Nousiainen, University of Jyväskylä, Finland; **Co-Author:** Anne Virtanen, University of Jyväskylä, Finland; **Co-Author:** Janne Fagerlund, University of Jyväskylä, Finland; **Co-Author:** Jenni Rikala, University of Jyväskylä, Finland

A common claim is that higher education is easily behind when discussing the early adoption of new educational innovations. The higher education institutions are adhered to the earlier traditions in their teaching.

Our aim was to analyze and develop educational practices for higher education in this digital society. This work built on the concepts of cultural ecology and 21st century skills in relation to pedagogy. The specific objective of this study was to find out: How the 21st-century skills framework contents appear in higher education development projects?

As a focus group we had 12 educational development projects in a Finnish university focusing on 'eEducation' in 2014. The data for the study was focusing on a variety of the reporting documents and outcomes of the projects. The data was qualitatively analyzed using content analysis.

The most frequent codes were related to Tools for working, and as a part of ways of thinking Learning to learn and metacognition. Personal and social responsibility, including cultural awareness and competence were the rarest ones.

The focus on Learning to learn and metacognition is promising for educational development, also the focus on collaboration. But as the 21st century main matches were Tools for working: Information literacy and ICT literacy. This raises the question, is the development still tool oriented? An essential question is why creativity and innovation were in minor role as they could be highly relevant for the future living in the world as well.

Children`s beliefs on leisure time writing: the pivotal role of motivation

Keywords: Attitudes and beliefs, Literacy, Primary education, Writing / Literacy

Presenting Author: Lisa Birnbaum, University of Erlangen-Nuremberg, Germany; **Co-Author:** Elisabeth M. Schüller, Leibniz-Institut für Bildungsverläufe (LIbBi) Bamberg, Germany; **Co-Author:** Stephan Kroener, Friedrich-Alexander-Universität Erlangen-Nürnberg (FAU), Germany

To acquire writing skills, children should write – not only write at school, but also in their leisure time. However, writing is also a cultural activity with value in itself. As there is a scarcity of research that investigates the whole bandwidth of determinants that predict leisure time writing in children, this has been the aim of the present study. Building on a prior qualitative study, eliciting the set of beliefs that may potentially determine leisure time writing and on two quantitative pilot studies, we asked 1109 third grade students (age $M = 8.7$ years, $SD = .63$) and their parents ($N = 1003$) to complete questionnaires on beliefs that may determine leisure time writing and on how much children write. Results provided evidence regarding invariance of the items across gender and mother's educational attainment. Moreover, in a structural equation model all predictors used in the study including motivation in action as a mediator explained a large proportion of variance in children's leisure time writing activities ($R^2 = .79$). The results are discussed with regard to how research on writing activities can be connected with research on writing achievement. Implications for families and teachers are considered.

Teaching Novice Middle School Writers to Construct and Critique Scientific Explanations

Keywords: Argumentation, Science education, Secondary education, Writing / Literacy

Presenting Author: Susan De La Paz, University of Maryland, United States; **Co-Author:** Daniel Levine, University of Maryland, United States

In the United States, the Next Generation Science Standards (NGSS) call for students to engage in scientific practices, such as constructing explanations and engaging in argumentation with evidence. While many studies in the science Education literature focus on engaging students in argumentation – on constructing, evaluating, and responding to scientific claims with evidence and reasoning (Berland & Hammer, 2012), much of this work focuses on oral discourse. In this study, we report on the effects of a cognitive apprenticeship designed to facilitate middle school students' efforts to construct and critique scientific explanations in writing using a single case design (multiple baseline design across classrooms) complimented by analyses of a counterbalanced transfer task that was administered before and after the study. Our results show positive effects on student learning on two writing tasks (one task was ongoing throughout data collection as part of the single case design and the other was a transfer task), which we disaggregate for three groups of learners, those who are: (a) proficient in both reading and writing, as measured by a high stakes standardized literacy test, (b) proficient in one but not both of the high stakes tests, and (c) below proficient on both the reading and writing assessments. Thus, we see initial evidence that young students can apply sophisticated criteria for evaluating the adequacy of their own written explanations as well as learn to construct causal explanations in science classes.

Writing Talk: Teacher Modelling of Metalinguistic Thinking about Writing

Keywords: Language (L1/Standard Language), Literacy, Teaching / instruction, Writing / Literacy

Presenting Author: Debra Myhill, University of Exeter, United Kingdom; **Co-Author:** Susan Jones, University of Exeter, United Kingdom; **Co-Author:** Helen Lines, University of Exeter, United Kingdom

The use of teacher modelling as a strategy for teaching writing has been a standard element in curriculum policy in many countries, for example, in the United States, England and Australia. Pedagogical guidance on teacher modelling of writing tends to emphasise teachers sharing their thinking and their composing decisions with young writers. Theoretically, teacher modelling draws on our understanding of metacognition, and particularly in relation to writing, self-regulation of the process of writing. However, the pedagogical and empirical attention has focused on strategic self-regulation and there is little that considers how teacher modelling can support writers in developing metalinguistic understanding about the textual choices they make as writers. Drawing on data from a three year longitudinal study, funded by the Economic and Social Research Council, this paper will consider *metalinguistic modelling*, where teachers model their thinking, as they write, aiming to help young writers understand the linguistic decision-making and the repertoire of choices available to them. The paper will outline the characteristics of effective and less effective teacher modelling of writing, and will develop and illustrate the new concept of 'metalinguistic modelling'.

Handwriting automaticity and writing instruction in Australian kindergarten: An exploratory study

Keywords: Achievement, Early childhood education, Teaching / instruction, Writing / Literacy

Presenting Author: Debora Valcan, Murdoch University, Australia; **Co-Author:** Anabela Malpique, Murdoch University, Australia / University of Lisbon, Portugal, Australia; **Co-Author:** Deborah Pino-Pasternak, Murdoch University, Australia

Abstract The present study examined the levels of handwriting automaticity at the end of kindergarten and the amount and type of writing instruction children experience before entering Year 1. The following questions were addressed in this study: (1) What level of handwriting automaticity do children exhibit at the end of kindergarten? (2) How much variation in writing automaticity is attributable to classrooms and schools? (3) What writing instruction do children experience at the end of kindergarten? (4) Are there associations between classroom writing instruction and children's level of handwriting automaticity? The current study involved 177 kindergarten children enrolled in 23 classrooms from seven public primary schools in Western Australia. Individual child level data (e.g., handwriting automaticity and word reading skills) were collected and teachers were asked to complete a survey assessing *the amount of time and types of writing activities developed in their classrooms (viz., teaching basic skills and teaching writing processes)*. *Hierarchical linear models were*

conducted to examine total variance attributable to child and classroom levels. Results showed a total variance of approximately 20% in children's handwriting automaticity attributable to differences among classrooms when gender and word-reading skills were controlled for. Large variability was noted in the amount and type of writing instruction reported by each participating teacher. Handwriting automaticity was associated with the teaching of revising strategies but not with the teaching of handwriting. Implications for writing development and writing instruction will be discussed.

Choice of STEM-Subjects for the Secondary School Leaving Examination - Determinants for Boys & Girls

Keywords: Achievement, Mathematics, Science education, Secondary education

Presenting Author: Nele Nicole Kampa, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:** Sonja Krämer, Leibniz-Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:** Bettina Hannover, Freie Universität Berlin, Germany

Students' STEM-related performances and academic choices in late secondary school channel their future choices of subject majors at university. In Germany, students have to choose at least one STEM-subject (mathematics, biology, physics, chemistry, or informatics) for their Secondary School Leaving Examination (*Abitur*). We examined what predicts students' choices among these options. Previous research found gender-related differences for academic choices and performances and influences of domain-specific abilities, expectations of success, attainment and utility values. We investigated whether these variables are differentially related to Abitur-exam choices of mathematics, biology or physics and students' performance in these exams and differences between boys and girls. We expected that performance outcomes are most strongly related to ability measures and subject choices to expectancy-value measures.

Our sample consisted of 3,639 13th graders who worked on achievement tests for science and mathematics, and on a questionnaire grasping science and mathematics self-concept, attainment and utility values. Consecutive logistic and linear regressions on Abitur-subject choice and performances in these exams showed differing predictors for mathematics, physics, and biology. We detected negative effects of math-related variables on the choice of biology and physics and vice versa. Subject choices were predicted by students' attainment values, while ability measures were better predictors of exam performance. Moreover, attainment values were more important for girls. Results imply the question whether the option to choose among different STEM-subjects encourages gender typed choices and enhances gender differences in performance outcomes – compared to a system where all students take the same exams, irrespective of personal (gendered) preferences.

Academic self-concept and its relationship with students' recovery after an achievement situation

Keywords: Achievement, Goal orientation, Motivation, Motivation and emotion

Presenting Author: Sigrid Wimmer, University of Graz, Austria; **Co-Author:** Helmut Lackner, Medical University of Graz, Austria; **Co-Author:** Manuela Paechter, University of Graz, Austria; **Co-Author:** Ilona Papousek, University of Graz, Austria

Students' acquire their academic self-concept via experiences and environmental feedback. Their self-concept is of importance concerning their performance, their approach towards achievement situations and their coping behavior. Coping includes the adjustment to a stressor and the adjustment after the stressful event has ended. The autonomous nervous system, which innervates the cardiovascular system, adjusts quickly to environmental demands. Markers of heart rate variability (HRV) index different processes, such as for sympathetic and parasympathetic tone. The present study investigated relationships between students' different types of self-concept and activity in sympathetic or parasympathetic nervous system after a real achievement situation in a university course. It was assumed, that different types of the self-concept are related to different coping processes observable in cardiovascular recovery. 69 students participated in the study. They all gave a presentation in a university course while their heart rate was recorded using portable ECG-devices. HRV data was analyzed calculating low frequency and high frequency variables. Results showed that the social self-concept was related to a still enhanced sympathetic tone after the presentation, indicating rather poor recovery. The absolute self-concept was related to rather efficient recovery after the achievement situation. It is assumed, that the social self-concept, which relies on comparison with others, contributes to misinterpretation of own abilities which may prevent efficient adjustment and leads to prolonged recovery. Absolute self-concept is a more general self-concept without a frame of reference. The lack of an external frame of reference may support the trust into one's own abilities.

The structure of math anxiety revisited: Incorporating psychological dimensions and setting factors

Keywords: Emotion and affect, Mathematics, Primary education, Quantitative methods

Presenting Author: Sofie Henschel, Humboldt Universität zu Berlin, Germany; **Co-Author:** Thorsten Roick, Senate Administration for Education, Youth, and Science, Berlin, Germany, Germany

We investigated the multidimensional structure of math anxiety and explored gender differences in the sub-dimensions of cognitive and affective math anxiety. In all, 368 elementary 4th grade students answered a questionnaire concerning their cognitive (worry) and affective (nervousness) math anxiety when dealing with mathematical problems in several settings (e.g., being evaluated by test or teacher, learning in class, studying individually, and applying mathematical concepts in everyday life). Testing alternative multidimensional models indicated a hierarchical structure of math anxiety. Specifically, a six-dimensional model with *math evaluation anxiety*, *math learning anxiety*, and *math application anxiety* originated from both cognitive and affective math anxiety at the second-order level. Girls reported higher math anxiety than boys, which was particularly pronounced in the total score of affective math anxiety and in high-stakes evaluation related settings. The gender differences in affective math evaluation anxiety also remained after controlling for mathematics performance, whereas gender gaps in all other sub-dimensions disappeared. Given that performance did not account for gender differences in affective math evaluation anxiety, future research needs to investigate whether and how environmental factors account for differences in particular in affective math anxiety concerning high stakes situations. Understanding how individual and environmental factors interact and relate to math anxiety sub-dimensions may help to design interventions in order to prevent and reduce cognitive and affective math anxiety in specific settings.

Relationships between school belonging and various student outcomes: A meta-analytic review.

Keywords: Achievement, Meta-analysis, Secondary education, Motivation and emotion

Presenting Author: Hanke Korpershoek, University of Groningen, Netherlands; **Co-Author:** Esther Canrinus, University of Agder, Norway; **Co-Author:** Marjon Fokkens-Bruinsma, University of Groningen, Netherlands; **Co-Author:** Hanke DeBoer, GION - University of Groningen, Netherlands

This meta-analysis examines the relation between students' sense of school belonging and their academic, motivational, social-emotional, and behavioural outcomes in secondary education. School belonging is defined by Goodenow (1993) as "the extent to which students feel personally accepted, respected, included, and supported by others in the school social environment" (p. 80). To further understand the size and direction (positive/negative) of the relationships between students' school belonging and these students' outcomes, the following research question is addressed: *To what extent is secondary school students' school belonging related to students' academic, motivational, social-emotional, and behavioural outcomes?* The meta-analysis includes 58 correlational studies, published in peer-reviewed journals between 2000 and 2015. Preliminary results reveal, on average, a small positive correlation with academic achievement. Small to moderate positive correlations are observed with the other student outcomes such as self-perceptions. A small negative correlation is observed with absence/drop-out rates. The results thus reveal that a sense of school belonging is an important factor in students' overall school functioning.

Different wording in multiple documents: Helpful or harmful for individual learning?

Keywords: Comprehension of text and graphics, Experimental studies, Motivation, Reading comprehension

Presenting Author: Cornelia Schoor, University of Bamberg, Germany; **Co-Author:** Nadine Melzner, University of Bamberg, Germany; **Co-Author:** Cordula Artelt, Bamberg University, Germany

Prior research has shown that in collaborative learning with multiple documents, using different words for the same concept is helpful for learning. This is probably due to the fact that students discuss the meaning of the different words and thereby learn more than if they are provided with the same wording. Whether this is also the case for individual learning with multiple documents has not been researched yet. In contrast to collaborative learning, individual learners might be cognitively overloaded if different words for the same concept are used, which might actually hinder learning, or only benefit from different wording if they invest the effort to elaborate on the meaning of the words. In the present study, N = 104 university students took part in two conditions: They received two texts on depression either in the same wording or in different wording. In addition, cognitive load and motivation were measured. The results show a positive effect of different wording on learning outcome only for those students who were highly motivated. This result indicates that also in individual

learning, different wording might be helpful, but only if the students are willing to invest the effort that is necessary to benefit from it.

Identifying learner profiles in secondary school students' text-learning strategy use

Keywords: Comprehension of text and graphics, Secondary education, Self-regulation, Student learning

Presenting Author:Amélie Rogiers, Ghent University, Belgium; **Co-Author:**Emmelien Merchie, Ghent University, Belgium;

Co-Author:Hilde Van Keer, Ghent University, Belgium

As the knowledge in our information society continues to escalate, so do the demands for the efficient and effective use of text-learning strategies. This is especially true in secondary education, where students are progressively expected to independently obtain knowledge from texts. However, little information is available on (a) learner profiles in secondary education and (b) the relationship between possible learner profiles and student background characteristics (e.g., gender, reading ability, and home language). In this study, four distinct learner profiles (i.e., integrated strategy users, information organizers, mental learners, and memorizers) were identified and validated based on students' self-reported strategy use by means of hierarchical and k-means cluster analysis. Participants included 1931 Flemish (Belgium) secondary school students. Findings showed a significant relationship between learner profiles and gender, revealing that more girls were profiled as integrated strategy users and information organizers, whereas more boys were identified as mental learners or memorizers. No significant relationship between learner profiles and reading ability or home language was found. Important parallels can be drawn with prior research in primary education, allowing a more longitudinal design to investigate cluster stability and cluster movement over time. Furthermore, attention is once more drawn to providing more explicit strategy instruction at the beginning of secondary education to stimulate students integrated strategy use. Limitations and suggestions for further research are discussed.

Effects of domain-specific epistemic beliefs and prior attitudes on source rankings

Keywords: Attitudes and beliefs, Comprehension of text and graphics, Emotion and affect, Mixed-method research

Presenting Author:Saskia Brand-Gruwel, Open University of the Netherlands, Netherlands; **Co-Author:**Johan van Strien, Open University of the Netherlands, Netherlands; **Co-Author:**Sander Kurvers, Fontys University of Applied Sciences, Netherlands

The quality of information on the Internet varies greatly. This is particularly true for controversial socio-scientific topics, for which disagreement exists across sources. The challenge is to distinguish reliable sources from less reliable ones. This is affected by people's epistemic beliefs and prior attitudes. We investigated how source rankings differed as a function of both domain-specific epistemic beliefs and prior attitudes when students were confronted with controversial socio-scientific topics from two different domains. Sixty-nine participants were presented with six sources on both a Biology and Economics topic. For each topic, two sources came from universities, two were newspaper articles, and two were forum contributions. For each source type, one source was PRO, and the other CON. After reading, participants ranked the sources on how influential they were in forming their point of view. For both the most and least influential source, they had to write down their reasons. We found differences in source rankings between the Biology and Economics domain. Whereas in the 'hard' Biology domain, the most trustworthy sources were seen as most influential and the least trustworthy as least influential, in the 'soft' Economics domain no such consistent pattern was found. Epistemic beliefs did not affect source rankings, and for both domains reasons behind rankings were predominantly based on content. However, prior attitudes led to biased rankings, particularly for the Economics domain. These results are in line with previous studies showing the biasing effects of prior attitudes on source evaluation.

Students analyzing multimodal meaning-making in digital videos

Keywords: Argumentation, Comprehension of text and graphics, Literacy, Technology

Presenting Author:Carita Kiili, University of Oslo, Norway; **Co-Author:**Blaine Smith, University of Miami, United States;

Co-Author:Miika Marttunen, University of Jyväskylä, Finland

The present study examines upper secondary school students' (n=180) skills in analyzing multimodal means used in a persuasive digital video. It also explores how gender, and self-reported language arts and health science grades predicted students' success in analyzing a digital multimodal video. Students were asked to analyze a YouTube video where two comedians demonstrated how important it is to vaccinate a child. From students' answers, we analyzed how well they were able to specify multimodal means (e.g., visuals, auditory, gestures, movement, gesture, and text) and explain how the means contributed to the argumentation of the video. A little less than a third of students were able to connect the multimodal means to argumentation in the video. Therefore, instruction should not only explicitly teach students to read different modes but also how modes are used for argumentative purposes. Male and female students performed equally well in the multimodal analysis task ($t=1.238$; $p=.217$). Regression analysis showed that the language arts and health science grades were only able to predict 9% of students' performance ($F[2.157]=8.721$; $p<0.001$). This implies that students' abilities to analyze multimodal meaning making may be related to their informal literacy practices. In order to become critical readers, student need support to develop the ability to recognize how different modes are used in creating persuasive messages, as well as how they generatively work together to create that messages.

Identification of Teaching Needs for Mid-Career and Senior Professors in Higher Education

Keywords: Case studies, Higher education, Teacher Professional Development, Teaching approaches

Presenting Author: Heather Kanuka, University of Alberta, Canada; **Co-Author:** Jason Holmes, The University of Alberta, Canada; **Co-Author:** Summer Cowley, The University of Alberta, Canada

Using multiple case study methods, the purpose of this multi-year study was to gain insights into (a) providing teaching development activities and resources that increases mid-career and senior professor participation and (b) determine whether the information provided is used in their teaching. To achieve the objectives semi-structured interviews were conducted with Deans, Directors and Heads (n=95) to identify teaching needs and high priority areas. Using the findings from the interviews, resources and activities in the teaching unit were implemented and assessed over a five-year period. At the conclusion of year five, a survey using Kirkpatrick's (2007) four-level evaluation model was sent to mid-career and senior professors (n=93). The survey results revealed that: 85% of respondents stated they enjoyed attending the sessions, 88% were satisfied with the programming and services and believed they increased their pedagogical knowledge, 72% attempted to change teaching practices as a result of the teaching unit's services and of those who made changes 98% stated they continue to incorporate these changes in their teaching. Participation of mid-career and senior professors in teaching unit services also increased from 2.4% to 34% over the five-years of this study. The findings of this study are encouraging on a number of fronts. The most striking and positive finding is that a large majority of mid-career and senior professors strongly believe in the importance of improving their teaching practices. Additionally, mid-career and senior professors also appreciated the ability to connect with colleagues across campus.

The development of self-efficacy and situational interest during a simulation of decision-making

Keywords: Higher education, Motivation, Self-efficacy, Motivation and emotion

Presenting Author: Dorothy Duchatelet, University of Antwerp, Belgium; **Co-Author:** Pieter Spooren, University of Antwerp, Belgium; **Co-Author:** Peter Bursens, University of Antwerp, Belgium; **Co-Author:** Vincent Donche, University of Antwerp, Belgium; **Co-Author:** David Gijbels, University of Antwerp, Belgium

Teachers of political science have been using simulations of decision-making as a teaching method for quite some time. Moreover, over the past years, research on their effects has also increased. However, it seems current research struggles to illuminate significant learning outcomes. This study aims to explore the development of affective learning outcomes during the simulation process. More specifically, the development of students' self-efficacy and students' situational interest for negotiating is explored. Data from 84 undergraduate and graduate students was collected during a four-day Model United Nations-simulation. Self-efficacy and situational interest, both for negotiating, were collected across 12 points in time. Data were analysed by means of longitudinal analysis via the SAS PROC MIXED procedure. After controlling for a number of student background variables, results showed a statistically significant upward linear trend for self-efficacy and a statistically significant U-curved trend for situational interest. Results serve further theory building on the effects of simulations of decision-making in general and confirm students benefit from simulations.

PORT program: An initiative to enhance university teachers' practice

Keywords: Higher education, Peer interaction, Synergies between learning - teaching and research, Teacher Professional Development

Presenting Author: Sharon Herkes, University of Sydney, Australia; **Co-Author:** Hilary Lloyd, University of Sydney, Australia; **Co-Author:** Graham Hendry, University of Sydney, Australia; **Co-Author:** Manjula Sharma, University of Sydney, Australia; **Co-Author:** Vicky Tzioumis, University of Sydney, Australia; **Co-Author:** Helen Georgiou, University of Wollongong, Australia

Supporting university teachers to enhance their teaching practice has the potential benefit of enabling quality student learning and improving graduate outcomes. Previous research has shown that peer review of teaching, in which a teacher receives constructive feedback from a colleague about their performance, can lead to improvements in teaching practice. Previous research has also shown that teachers who engage in observing (watching) a colleague teaching well (without necessarily giving this colleague feedback) can also learn how to enhance their practice. However we know very little about the combined benefits of supporting the same teacher in an integrated way through both approaches. In this symposium presentation we describe the design of a professional development program called the Peer Observation and Review of Teaching (PORT) program, which uses both peer review and observation in an integrated design of reflective-practice activities to enhance teachers' practice in a faculty of Science in a large Australian university. We report the results of a

research project conducted to evaluate the PORT program that addresses key questions of whether (1) university teachers' practice was enhanced and improvements sustained as a result of participating in the program, and (2) the program can be self-sustaining. We argue that properly sponsored, the PORT program can become a self-sustaining community-of-practice model for improving university education.

A study of academics' perceptions of knowledge sharing on teaching and research

Keywords: Higher education, Social aspects of learning and teaching, Social interaction, Teacher Professional Development

Presenting Author: Tracy Zou, The University of Hong Kong, Hong Kong

Knowledge sharing has been found to be beneficial to many organisations and institutions including universities. However, academics' perceptions and intentions to share knowledge have not been fully understood. Although academics are knowledge workers and naturally familiar with knowledge sharing activities, the increasingly competitive environment and a stronger measured culture in the higher education sector might decrease one's intention to share knowledge with colleagues. This study aims to investigate academics' perceptions of knowledge sharing in two core aspects of their work: research and teaching. A mixed method was adopted consisting of semi-structured interviews and a questionnaire survey. Both the qualitative and quantitative data consistently show that all participants enjoyed knowledge sharing with their colleagues in a general sense. Knowledge sharing on good teaching and learning practices was perceived by more participants as important than knowledge sharing on research. However, nearly half of the participants did not feel that their work environment supported knowledge sharing in research or teaching. The results implied that more initiatives would be needed to encourage and recognise knowledge sharing from the university level especially in the teaching and learning aspects.

Stakeholders' perceptions on in-service training in Mongolia

Keywords: Developmental processes, Educational policy, In-service teacher education, Quantitative methods

Presenting Author: Davaajav Purevjav, University of Szeged, Hungary; **Co-Author:** Edit Katalin Molnar, Szeged University, Hungary

While the necessity of in-service teacher training (IST) is not debated, there exist different views on its objectives and forms, influenced by cultural, policy and practical considerations. Unidentified differences in the views of participants, trainers, and employers may harm the effectiveness and efficiency of any training program. This paper reports on survey data from a needs assessment study for Mongolian IST. It aims to compare the views of six different stakeholder groups (teachers; national and local trainers; senior advisor teachers; and school directors and managers) regarding areas of professional development. A questionnaire was developed and administered to a sample of 940 educational professionals. It was based on a list of teacher knowledge components often included in national standards. The items of this list were then rated by participants on five point Likert scales in response to questions ranging from the estimation of present teacher knowledge levels to changes of teaching behaviour following formal IST training. Based on the results of factor analyses, comparable index variables were created for each question. ANOVAs showed significant differences between the stakeholder groups on these indexes. The findings highlight issues policy makers and trainers should consider when planning general (non-subject specific) IST curricula.

Spotlight on professional development: What kinds of teachers benefit most from a PD workshop?

Keywords: Attitudes and beliefs, In-service teacher education, Teacher Professional Development, Teaching / instruction

Presenting Author: Michael Besser, Leuphana University of Lüneburg, Germany; **Co-Author:** Anna-Theresia Decker, Goethe-University Frankfurt, Germany; **Co-Author:** Dominik Leiss, Leuphana University of Lüneburg, Germany; **Co-Author:** Mareike Kunter, Goethe-Universität Frankfurt, Germany

In this study we investigated how teachers' individual prerequisites and their cognitive engagement during a professional development (PD) workshop affect changes in their beliefs and instructional behavior. Drawing on the models of Dole & Sinatra (1998), Gregoire (2003), and Kunter et al. (2013), we assumed that teachers with higher personal resources, e.g. time, would appraise a PD workshop as challenging instead of threatening. This in turn should lead to deeper cognitive engagement. In addition, we assumed that higher cognitive engagement would lead to a more pronounced change in

beliefs and better implementation of the workshop content in teachers' instruction. We tested these assumptions on a sample of 66 secondary school teachers who participated in a PD workshop on competence-based instruction in mathematics. Before the workshop teachers reported on Likert-type scales on their resources (time and personal relevance of the workshop content) and their appraisal, during the workshop on their cognitive engagement and after the workshop on their implementation of the workshop content in their instruction. Teachers' beliefs and instructional behavior were assessed before and after the workshop. Linear regression and correlation analyses revealed that teachers with higher personal resources were more likely to appraise the workshop as challenging, which in turn was positively related to their cognitive engagement. Teachers' cognitive engagement explained the changes in their beliefs and instructional behavior and was positively related to subsequent implementation of the workshop content. Altogether, our results show that teachers are learners with individual prerequisites which determine the success of their professional development.

Measuring the Instructional Quality of Private Tutoring Lessons and its Effects on Students' Grades

Keywords: Achievement, Out-of-school learning, Secondary education, Teaching / instruction

Presenting Author:Karin Guill, Leibniz Institute for Science and Mathematics Education, Germany; **Co-Author:**Oliver Lüdtke, Leibniz Institute for Science and Mathematics Education and Centre for International Student Assessment, Germany; **Co-Author:**Olaf Koeller, Leibniz Institute for Science and Mathematics Education, Germany

In addition to mainstream education many students attend private supplementary tutoring. Students invest a lot of time and parents a lot of money on these additional lessons. However, research on the effects of private tutoring on student achievement shows mixed results. Therefore, more detailed analyses are necessary showing under which conditions private tutoring improves school achievement. The framework for out-of-school learning environments of the German National Educational Panel Study (NEPS) differentiates between the dimensions of structure, challenge and support in private tutoring to describe the instructional quality of private tutoring lessons. To evaluate this framework, we used data from a NEPS student cohort in Grade 10. Confirmatory factor analyses showed a sufficient fit of the model to private tutoring lessons in mathematics and English. The instructional dimensions were in part weakly negatively related to the students' prior achievement and in part positively related to the tutors' formal qualification. When controlling for mid-year grades, gender, academic self-concept, academic track and tutoring intensity we found no effect of any dimension of instructional quality on the students' year-end grades in mathematics.

Using learning journals for monitoring student learning processes in the context of video analysis

Keywords: Pre-service teacher education, Reasoning, Reflection, Video analysis

Presenting Author:Sandro Biaggi, Zurich University of Teacher Education, Switzerland; **Co-Author:**Kathrin Krammer, University of Teacher Education Lucerne, Switzerland; **Co-Author:**Isabelle Hugener, University of Teacher Education Lucerne (PH Luzern), Switzerland

Professional vision, defined as the ability to notice and interpret classroom situations, is considered to be an important prerequisite for effective teaching. Although a continuously growing body of studies show that classroom videos can be a powerful tool for promoting (pre-service) teachers' professional vision, only scant research has been carried out on the processes of learning with videos so far. Against this background we conducted an intervention study, in the course of which we were able to foster the professional vision of pre-service teachers through video analysis. With the intention of obtaining a better understanding of the participating students' learning processes, a complementary learning journal was implemented. The students were asked to consolidate their findings from the preceding video analysis and to formulate pedagogical ideas that were to be put into practice in their own teaching. Besides, they were expected to give reasons for the significance of their reflections and teaching ideas by drawing on their theoretical knowledge. For monitoring the development of the students' professional vision, we are currently analysing their learning journal entries. Our content analyses focus on the type and the accuracy of the students' reflections as well as on their ability to provide theory-based reasons for the teaching ideas they proposed. Overall, our results provide new insights into the learning processes that occur when classroom videos are used for fostering pre-service teachers' professional vision. This is why the project is of importance both for research and for teacher education.

Impact of pacing and cognitive style on learning with dynamic and non-dynamic visualizations

Keywords: Comprehension of text and graphics, Educational Psychology, Instructional design, Multimedia learning

Presenting Author:Marta Koć-Januchta, University of Duisburg-Essen, Germany; **Co-Author:**Tim Hoeffler, Leibniz Institute for Science and Mathematics Education (IPN), Germany; **Co-Author:**Helmut Precht, Institut für Biochemie und Biologie, Germany; **Co-Author:**Detlev Leutner, University of Duisburg-Essen, Germany

The aim of this study was to investigate the role of visual/ verbal cognitive style and learner/ system control in dynamic and non-dynamic multimedia learning environments. A group of 235 students learned from a computer-based animation or a series of static pictures with spoken explanatory text with or without the possibility to pause, to play, or to fast-forward/ rewind the learning environment (self-paced vs. system-paced). It turned out that animations provided better results on learning outcome than static pictures regardless of cognitive style and type of pacing. Participants also obtained better results when learning with the system-paced environment than with the self-paced one. A significant triple interaction of cognitive style, type of pacing, and type of visualization showed that highly developed visualizers learned poorer with self-paced static pictures than with system-paced static pictures. Additionally, less developed visualizers outperformed highly developed visualizers when learning with self-paced static pictures. No significant interaction effects were found regarding verbal cognitive style.

Multimedia Learning in Children with Dyslexia

Keywords: Comprehension of text and graphics, Learning and developmental difficulties, Primary education, Multimedia learning

Presenting Author:Carolien A. N. Knoop-van Campen, Radboud University Nijmegen, Netherlands; **Co-Author:**Eliane Segers, Radboud University Nijmegen / University of Twente, Netherlands; **Co-Author:**Ludo Verhoeven, Radboud University Nijmegen, Netherlands

The Cognitive Theory of Multimedia Learning predicts modality and redundancy effects. Spoken texts with pictures have often been shown to have a larger learning effect than written texts with pictures. However, this modality effect tends to reverse on the long term. This long-term effect has not been studied regarding the redundancy effect (i.e. presenting identical information in different multimedia forms simultaneously). The modality and redundancy effect in multimedia learning are based on optimal use of working memory capacities. Children with dyslexia have lower working memory capacities but often are still provided with multimedia to support their reading. Multimedia learning may thus differ in this group. We compared learning gains of 26 children with and 38 without dyslexia (age 11) who were presented with different types of learner-paced multimedia lessons. We assessed both quantity and quality of learning directly after studying and after one week. Modality and redundancy effects were found with regard to the amount of time children with dyslexia spent in different conditions, but not for typical readers or for learning gain in both groups. Children with dyslexia spent more time learning in the text-condition, than in the audio- or text&audio-condition. We can conclude that in a user-paced multimedia learning environment, it is more efficient to provide information in an auditory way or with auditory support to children with dyslexia, but not necessary for typical readers.

Prompting and Time of Testing in Learning with Animations Compared to Static Pictures

Keywords: Comprehension of text and graphics, Computer-assisted learning, Instructional design, Multimedia learning

Presenting Author:Tim Kühn, University of Mannheim, Germany; **Co-Author:**Sabrina Navratil, University of Mannheim, Germany; **Co-Author:**Stefan Münzer, Universität Mannheim, Germany

Animations can possess an informational advantage compared to static pictures. This informational advantage was assured for the used animations of the current study. Thereby, it was investigated whether the corresponding informational disadvantage of static pictures can be compensated by prompting learners to actively engage with the instructional material. Moreover, it was examined whether this engagement would lead to a better lasting knowledge representation, particularly for learners with static pictures, since they are supposed to engage more deeply with the prompts. To test this, a 2x2x2 Between-Subjects-Design with visualization format (static picture vs. animation), prompts (absent vs. present) and time of testing (immediate vs. after one week) as independent variables was used ($N = 263$). Results revealed that participants performed better in the knowledge test when learning with animations compared to learning with static pictures. Moreover, participants remembered the content better when tested immediately than when tested after one week. Others than expected, providing prompts did not compensate the performance of learners receiving static pictures, irrespective of time of testing. When analysing the answers to the prompts, results showed that learners with animations were better able to correctly answer the prompts than learners with static pictures. Moreover, the performance in answering the prompts mediated the differences in the knowledge test between animations compared to static pictures. In a follow-up study, it might be reasonable to investigate the impact of conveying prerequisite knowledge for answering such prompts, and whether this might especially help learners with static pictures.

Mixed camera angles viewpoints improve learning medical hand procedure from video in nurse training

Keywords: Comprehension of text and graphics, E-learning / Online learning, Educational Psychology, Instructional design

Presenting Author:Jean-Michel Boucheix, University of Dijon, LEAD-CNRS, France; **Co-Author:**Perrine Gauthier, University of Dijon, LEAD-CNRS, France; **Co-Author:**Jean-Baptiste Fontaine, University of Dijon, LEAD-CNRS, France; **Co-Author:**Sandrine Jaffaux, IFSI Dijon, France

Few previous research showed that camera viewpoints differences played a role in learning hand procedures from videos. However, learning videos on hand procedures showing only single viewpoints have been investigated, for example face to face vs. over the shoulder views. Further, the effect of seeing the human model's face and the effect of showing hand

actions have also been studied. The results of these research are not always consistent. The goal of the present research was to investigate the effect of mixed camera viewpoints on learning a medical hand procedure from a video. Within a pretest-posttest paradigm, 43 students from a French institute of nursing education had to learn a complex hand procedure from a video showing an expert nursing teacher who installed an indwelling catheter in a closed system. Three videos conditions were compared showing the hand procedure respectively from (i) a face to face view (FtF), an over-the shoulder view (OtS) and (iii) an alternation of face to face and over the shoulder views (MixW). The students were randomly assigned (N =10-11) to one of four groups: the three experimental viewing conditions (FtF, OsS, MixW) and a control condition, without video. Pre and post-test consisted in the demonstration of the hand procedure in a full scale simulation room fully equipped. Results showed that learners in the mixed viewpoint (MixW) group performed better than the other groups (FtF, OsS, MixW and control condition). Learners in the FtF and OsS groups had better scores than learners in the control group.

Development of spatial reasoning in Chilean 2nd graders: effects of in-class intervention

Keywords: Mathematics, Primary education, Quasi-experimental research, Reasoning

Presenting Author: Carolina Araya, Pontificia Universidad Católica de Chile, Chile

Abstract During last decades a growing body of knowledge has renewed and increased the interest in the development of spatial reasoning. That because spatial reasoning predicts success in the fields of science, technology, engineering and mathematics. From a pedagogical perspective, different studies have shown a consistent correlation between spatial skills and early mathematics performance. However, there are few studies available regarding causal effects between spatial reasoning and mathematical skills and their findings are inconsistent. The objective of this research was to design and evaluate the effects of an intervention to develop and strengthen spatial reasoning in second-grade students. Also, the research wanted to contribute to existing literature, by identifying underlying mechanisms that predict spatial and mathematical abilities. For this purpose, variables associated with spatial reasoning were measured during training sessions, such as the use of spatial language and gestures. The research design was quasi-experimental and mixed design (between-within subjects). Two Chilean urban schools with two parallel 2nd grade class participated. In each school, one classroom was assigned to experimental condition and the other one, to control condition. Both schools attend students from low-middle SES. The classrooms grouped 126 students. 47% of students were female. 50% of students belong to experimental condition. Preliminary results show a positive effect of training in some spatial skills and visual-spatial memory. However, there isn't clear causal effect of spatial training over mathematic performance. Path analysis showed interesting mediator roles between spatial reasoning, spatial language, and gestures.

Kindergarteners' Reading Behaviors with Multimodal Digital Texts and Comprehension Outcomes

Keywords: Comprehension of text and graphics, Early childhood education, Literacy, Technology

Presenting Author: X. Christine Wang, State University of New York at Buffalo, United States; **Co-Author:** Tanya Christ, Oakland University, United States

Grounded in transactional reading and new literacies theories, this study examined 55 U.S. kindergartners' (ages 5-6) multimodal digital text reading behaviors (reading mode, reading sequence, use of congruent hotspots, use of incongruent hotspots, use of prompted hotspots, use of unprompted hotspots, multiple uses of hotspots, layering use of modalities, rereading words, rereading pages, and spontaneous use of comprehension-monitoring strategies), and how these related to their comprehension outcomes (unprompted retelling, prompted retelling, inference/critical-thinking responses, vocabulary meaning derivations, connections, and strategic use of app book affordances). Pre-testing included Concepts About Print and listening comprehension. Kindergarteners' app book reading behaviors and comprehension outcomes were individually tested 6 times across the school-year with novel app books, yielding 318 test sessions (some missing data). Each test session was video-recorded and coded by two coders with high inter-rater reliability. A multivariate, mixed-response model was used for analysis. Findings showed that using the "read to me" mode, listening to the text read aloud, using unprompted congruent hotspots, and strategic use of app book affordances were all linked to better comprehension outcomes; however, differential outcomes were found by books. Implications include addressing these skills through reading instruction, and selecting texts that have features that align with learning objectives.

Using a robot in a dynamic testing setting: examining series completion performance

Keywords: Experimental studies, Learning Technologies, Problem solving, Reasoning

Presenting Author:Merel Bakker, KU Leuven - University of Leuven, Belgium; **Co-Author:**Wilma Resing, University of Leiden, Netherlands

Robots are increasingly becoming integrated in our society and show potential for being used in educational context. Young children are able to learn from a robot in several cognitive domains, such as science, language, and mathematics. We examined the use of a robot as a mediation tool in a dynamic testing setting. The dynamic testing approach involved the provision of feedback and training during testing. The robot we utilised was an animated, table top robot. We examined the effectiveness of dynamic testing with graduated prompts and scaffolding provided by the robot. The study employed a pre-test post-test control-group design with two training sessions. A dynamic visual-spatial task was used that consisted of series completion items. The robot was programmed to provide verbal and non-verbal feedback and prompts regarding children's solutions during the two training sessions. Finding revealed that trained children showed greater improvement in reasoning accuracy than children in the control group. Results are discussed with regard to the theoretical and educational implications of using a robot as a mediation tool.

Autonomy support and its associations with child individual characteristics and relational processes
